class were launched in 1911 and three of the "Imperator Alexander III." class (for the Black Sea Fleet) in 1914. The first four were slightly heavier, longer and faster than the others, but their general characteristics are similar. They all mount 12 12-in. in four triple-gun turrets on the centre line of the vessel, arranged similarly to the Italian "Dante Alighieri," the speed of which, 23 knots, was the same as that of the "Sevastopol," the Black Sea vessels being 2 knots slower, all the vessels having turbine engines.

The "Imperatrice Marie" was blown up by an internal explosion at Sevastopol in 1916, and refloated and docked upside down in 1919, similarly to the "Leonardo da Vinci."

(7) *Austria*.—Three battleships of intermediate ("Lord Nelson" type) were completed in 1910 and 1911. Following these vessels four "Dreadnoughts" of the "Viribus Unitis" class were completed in 1912–5. On a displacement of 20,000 tons, 12 12-in. guns in four triple-gun turrets (of 11-in. armour maximum) were carried in two superposed groups forward and aft with 12 5.9-in. guns as secondary armament in an amidships battery protected by 6-in. armour. The water-line belt was 11 in. amidships and 5 in. at the ends. An upper belt of 8 in. was fitted amidships. Turbine engines of 25,000 H.P. gave a speed of about 20 knots.

Two vessels, the "Szent Istvan" of this class and the old battleship "Wien," were sunk during the war as the result of daring attacks by Italian fast motor-boats. The "Viribus Unitis" sank in 1918, due to the explosion of a mine placed in contact with the vessel by two Italian officers in a small torpedo-like motor-boat.

A contemplated programme of four battleships of 25,000 tons, carrying eight 15-in. guns, did not materialize owing to the war. (8) *Argentina*.—The only "Dreadnought" battleships are the "Moreno" and "Rivadavia," launched in the United States in 1911 and completed in 1914; 12 12-in. guns, in six twin-gun turrets, and 12 6-in. guns are carried on a displacement of 27,600 tons, turbine engines of 39,500 H.P. giving a speed of 22½ knots.

(9) *Brazil*.—The "Rio de Janeiro," laid down at Armstrong's, Newcastle, in 1911, was sold later to Turkey, from whom the vessel was requisitioned by the British on the outbreak of the World War, and renamed "Agincourt." The "Minas Geraes" and "São Paulo" are thus the only two "Dreadnought" battleships possessed by Brazil.

(10) *Chile*.—The "Almirante Latorre" and "Almirante Cochrane" were building at Armstrong's in 1914 for the Chilean navy. The former vessel, after service during the war as H.M.S. "Canada," was sold back to Chile, but the latter vessel remains as H.M.S. "Eagle." Chile thus possesses only one "Dreadnought."

(11) *Greece*.—The "Salamis," of 19,500 tons and 23 knots speed, building in Germany at the outbreak of war in 1914, had not been completed. The four twin-gun turrets constructed in the United States for this vessel were purchased by the British and fitted in the first four large monitors.

(12) *Norway*.—The "Nidaros" and "Björgrin" (coast-defence battleships), launched by Armstrong's in 1914, were taken over by the British during the war and completed, with the addition of bulges, as H.M.S. "Glatton" and "Gorgon."

(13) *Spain*.—The smallest "Dreadnought" battleships ever designed have been completed for the Spanish navy. On a displacement of 15,500 tons, the "Alfonso XIII.," "España," and "Jaime I." carry 8 12-in. guns in four turrets (the amidships turrets being en echelon) and 20 4-in. guns. Turbine engines of 15,000 H.P. give a speed of 19½ knots. Armour protection consists of a 9-in. water-line belt, with 10-in. armour for the turrets and conning tower. The vessels were built in Spain from designs and under the supervision of British firms.

(14) *Sweden*.—Three small battleships, the "Sverige" (completed in 1917), and the "Drottning-Victoria" and the "Gustav V." (which in 1921 were nearing completion), are of 7,600 tons displacement. They mount four 11-in. and eight 6-in. guns, and with turbine engines of 22,000 H.P. a speed of 22 knots is expected.

(15) *Turkey*.—Two battleships completing in England for the Turkish navy were taken over by the British Government on the outbreak of war and renamed "Agincourt" and "Erin."

#### Battle Cruisers

Up to 1921 battle cruisers had been built only for Japan, Germany and Russia, besides Great Britain (see Table VII.). The United States had six vessels building.

*United States*.—The "Lexington" class (fig. 39) were designed in 1916, but no progress was made in their construction during the war. After the Armistice their design was reconsidered. The displacement was increased from 35,300 tons to 43,500 tons, the main armament being changed from 10 14-in. guns to 8 16-in. guns. The S.H.P. was 180,000 total, driving four propellers, and this was estimated to give 35 knots as the original design displacement and 33½ knots for the final design. This enormous H.P. (the maximum so far contemplated for any ship) is developed by the electric drive, on generally similar but improved lines to that of the "New Mexico." Oil fuel only is burnt in the boilers. The changes made included considerably increased protection against gunfire and under-water attack. The result of all the changes made is that the vessels will be powerful battle cruisers, with good offensive and defensive qualities as compared with the initial design. The torpedo

armament is very large for a U.S. vessel, consisting as it does of four submerged and four above-water 21-in. torpedo tubes. None of the vessels had yet been launched in 1921.

*Russia*.—Four battle cruisers were launched in 1915, but they had not been completed up to 1921. On a displacement of 32,200 tons, with a length of 750 ft., 12 14-in. and 24 5-in. guns and 6 tor-

ful torpedo armament of 8 submerged 21-in. torpedo tubes. Four battle cruisers of the "Amagi" class were in 1921 under construction. They were reported to be vessels of 40,000 tons displacement and 30 knots speed, with a main armament of 8 16-in. guns.

*Germany*.—As with the "Dreadnought" type of battleship, the Germans followed the British in their battle cruisers. The first vessel of the type, "Von der Tann," was launched in 1909. On a displacement of 19,100 tons she carried 8 11-in. and 12 5.9-in. guns. The armour belt was of 10-in. (maximum) thickness and her designed speed was 24 knots, the turbine engines developing about 45,000 horse-power. This speed and H.P. were exceeded on trials. The "Moltke" (1910), "Goeben" (1911), of 22,600 tons and 25 knots, and "Seydlitz" (1912), of 24,600 tons and 26½ knots (fig. 40) were generally improvements on the "Von der Tann." The main armament consisted of 10 11-in. guns arranged as in the British "Neptune" (of two years earlier design), as compared with 8 13.5-in. guns in contemporary British battle cruisers. The "Goeben" was transferred to Turkey early in the war, having been in the Mediterranean when the war broke out. Return to Germany being impos-

FIG. 39.

pedo tubes were to have been carried, turbine engines of 66,000 H.P. being estimated to give a speed of 27 knots. The side armour had a maximum thickness of 12 inches.

*Japan*.—The "Tsukuba" and "Ikoma" were laid down in 1905 and the "Kurama" and "Ibuki" in 1907. These vessels are classed as battle cruisers, but they lacked the high speed considered an essential feature of the battle-cruiser type. The "Tsukuba" was blown up in a Japanese harbour in 1917. The next

FIG. 40.

battle cruisers built by Japan were the four vessels of the "Kongo" class, launched in 1912-3, the name ship being constructed by Vickers at Barrow, and her sisters in Japan. These vessels resemble the "Lion" class, having an armament of 8 14-in. and 16 6-in. guns on a displacement of 27,500 tons, a speed of 27 knots being obtained with turbines developing 64,000 horse-power. The vessels are well protected by 10-in. (maximum) armour, and they carry a power-

FIG. 41.

sible, she escaped to Constantinople. The "Seydlitz" was badly damaged at the battles of Dogger Bank (1915) and Jutland (1916). Her return to harbour after the latter was only effected with great difficulty, and probably only the close proximity of the German coast enabled her to reach port in time. The "Derfflinger" (1913) and "Lützow" (1913) were the first German battle cruisers to mount 12-in. guns, of which they carried eight on a displacement of 26,200 tons. The speed was 26½ knots and maximum armour 12 in. thick. The "Lützow" was sunk at the battle of Jutland. The "Hindenburg" (fig. 41), launched in 1915 and completed in 1917, and "Mackensen," launched in 1917 but not completed, were virtually repeats of the "Lützow," with the same armament, but improved speed of 28 knots. The "Graf von Spee," also launched in 1917 but not completed, was of 27,000 tons, with six 15-in. guns as the main armament. A sister vessel, "Prinz Eitel Friedrich," had not been launched at the Armistice. The last three vessels were dismantled, as well as other battle cruisers whose construction had not been far advanced.

#### Light Cruisers

The light cruiser type of warship has in recent years been constructed by very few nations (see Table VIII.). The United States

did not construct any after the completion of the "Salem" class in 1908 until after the World War, when the construction of 10 light cruisers of the "Omaha" class (fig. 42) was commenced. These vessels were designed in 1916 and their construction authorized by the Act of Congress of 1917. The chief characteristics of these vessels, which are classed as "Scouts" by the U.S. navy, are an over-all length of 555½ ft., a displacement of 7,100 tons, S.H.P. of turbine engines 90,000, giving an estimated speed of 35 knots. The armament at first consisted of eight 6-in. guns arranged in double-

similar to the British "Arethusa" class, with higher speed and reduced armament. On a displacement of 3,500 tons, a speed of 31 knots is obtained with 51,000 H.P. and four 5.5-in. guns are carried. Following these vessels were eight light cruisers of the "Tama" class, some of which have been launched. Twelve additional light cruisers of the 1920 programme will follow. It is understood that these 20 vessels are generally of the same class and are a considerable improvement upon the "Tatsuta." On a displacement of 5,500 tons, seven 5.5-in. guns will be carried and engines of 90,000 H.P. will be fitted to give a designed speed of 36 knots.

**Germany.**—The German naval programme provided for a small number of light cruisers to be built each year. The four vessels of the "Cöln" class, completed in 1910 and 1911, were of 4,280 tons, 25½ knots and carried 12 4.1-in. guns. They were an advance in size and speed on their predecessors. In 1912 and 1913 six vessels of slightly greater displacement and speed than the "Cöln," but with the same armament, were completed. The next 14 vessels, completed 1914-5, were of 5,000 tons, 27 knots, 30,000 H.P., and had an improved armament of 2 5.9-in. and 10 4.1-in. guns. During the World War a number of light cruisers were built, the chief characteristics of which were their improved armaments, 6, 7, and 8 5.9-in. guns

FIG. 42.

storied batteries of four guns each, forward and aft, but recently this armament has been augmented by the addition of a twin 6-in. gun turret on the centre line forward and aft. The torpedo armament is to consist of two 21-in. above-water torpedo tubes. Protection, consisting of 3-in. total, is provided amidships to the machinery compartments. With the exception of some protection to the steering gear, the side protection does not appear to be so extensive as that provided for British light cruisers. Oil fuel only is burnt in the boilers of these vessels, the machinery arrangement of which is of considerable interest. The turbine engines drive four propellers, the engines for the outer shafts being accommodated in an engine-room situated between two groups of boiler-rooms, the engines for the inner shafts being in another engine-room abaft the second group of boilers. The turbines are geared, the reduction gears being of the Westinghouse floating-frame type. Cruising turbines are fitted to obtain economy at cruising speeds.

**Japan.**—Three light cruisers were completed for Japan in 1912. These vessels, of about 5,000 tons displacement, 26 knots and carrying eight 6-in. guns, are very similar to their British contemporaries of the "Newcastle" class. No other light cruisers were built by Japan until the "Tatsuta" and "Tenryu" were laid down in 1917 and completed in 1919. These vessels are in general characteristics

FIG. 43.

being carried. Some of the earlier cruisers were rearmed with 5.9-in. guns in lieu of 4.1-in. guns originally fitted. The "Brummer" and "Bremse," two of the surrendered vessels, were interesting ships. They were mine-laying cruisers of 4,000 tons, and, with turbine engines of 46,000 H.P., were generally credited with a speed of 34 knots, but this was at least 4 knots higher than the actual speed. They were arranged to carry about 300 mines. One of the chief differences between British and German light cruisers lay in the

protection. British vessels, after the "Weymouth" class, were protected by side plating of 3-in. total thickness, the German vessels having less or no side protection, but with decks of 1-in. or 2-in. thickness. A number of light cruisers were under construction at the Armistice. The "Cöln" is typical of them. On a water-line length of 489 ft. and displacement of 5,600 tons, she was to have carried 8 5.9-in. guns (five of which could be fired on the broadside), 3 3½-in. H.A. guns and 4 revolving 23.6-in. torpedo tubes. Turbine engines of 29,000 S.H.P. were to have been provided for a speed of 27½ knots. The protection consisted of about 2½-in. side and 3-in. deck.

Four of the German light cruisers were incorporated, with new names, in the French navy, and three in the Italian navy.

*Austria*.—In 1910 the light cruiser "Admiral Spaun" was completed and in 1914 three similar but slightly improved vessels. These were of 3,500 tons, 27 knots, and mounted 9 3.9-in. guns. Two of these vessels were taken into the Italian navy, and one into the French navy, all with new names.

*Italy*.—Six small light cruisers were completed between 1912 and 1916. The most interesting were the "Quarto" class (three vessels), of 3,400 tons and 28 knots, carrying 6 4.7-in. and 6 3-in. guns (see fig. 43).

*Russia*.—At the outbreak of the World War two small light cruisers, which were taken over by Germany, were under construction in German yards. One is now in the French navy, and the other was lost at Jutland. Eight light cruisers of a larger and more powerful type were under construction in Russia, but were not completed. They were designed to be 520 ft. long, of 7,600 tons displacement, armed with 15 5-in. guns, and, with turbines of 55,000 H.P. a speed of 30 knots was expected.

*Holland*.—Two light cruisers of 7,000 tons and 30 knots, with 10 5.9-in. guns, were under construction for a long time, but had not yet been completed in 1921.

*Spain*.—A light cruiser of 5,600 tons, generally similar to the British "Birmingham," was being completed in 1921, and others of this class were projected.

*France*.—Six light cruisers of 5,000 tons, 30 knots speed and 8 5.5-in. guns, were projected in the 1920 programme.

#### *Torpedo-Boats and Submarines*

Specifications of the torpedo-boats and flotilla leaders and submarines of foreign navies are given in Tables IX. and X., and the reader is referred to the *Transactions of the Institute of Naval Architects*, 1920, for further information.

### (3) MERCHANT SHIPS

The ordinary course of mercantile shipbuilding development, which continued from 1910 until the autumn of 1914, was

abruptly checked by the World War. As the result, merchant shipbuilding was practically stopped in France, Germany, Italy and Austria, and it was very much reduced in the United Kingdom owing to men joining the colours. At the same time a great fillip was given to shipbuilding in the United States and neutral countries. In England many of the best ships building were requisitioned and fitted out for war services, or for auxiliary services with the fleet. Large numbers of vessels were also withdrawn from the mercantile fleet for similar purposes, and this, together with the great losses due to submarines, very quickly created great demands for new ships. Shipbuilding resources were developed with great rapidity all over the world, leading up to: (1) a vastly increased output; (2) new types of vessels which could be constructed quickly; (3) development of new methods of construction. At the same time a vast increase took place in the plant of all kinds for the manufacture of armament, etc. The services rendered by the mercantile marine during the war were invaluable (see SHIPPING), while, broadly speaking, the ships themselves stood the brunt of war with very remarkable success. In some cases, however, large passenger ships were quickly sunk because of the existence of passages, or doors in bulkheads, which permitted the sea to find access to compartments other than those directly damaged, thus leading to the foundering of the vessels. This caused renewed attention to be given in all maritime countries to matters of life-saving and subdivision.

Many very notable vessels were lost. Some of the best known are shown in Table XI. Among these losses, the "Britannic" and "Justicia" (formerly "Statendam") were the largest vessels building in the United Kingdom in 1914.

After the war the German ships which had been seized or interned were distributed among the Allies. Germany also had to surrender all ships above 1,600 tons afloat or on the stocks, many smaller ones, floating docks, cranes, and other craft, amounting to about 3,000,000 tons. These were divided chiefly between Britain and the United States, with smaller shares to France and Japan. She also had to undertake to build 1,000,000 tons for the Allies if required, but this was not enforced. Table 12 gives the names of some of the most noteworthy vessels thus distributed.

TABLE IX.—*Torpedo-Boats and Flotilla Leaders.*

Austria . . . . .	1912	266	787	17,000	33	2—4 in. 4—3 in. 2 T. T.
Italy . . . . .	1916	310	1,460	40,000	35	5—4.7 4—21 in. T. T.

Table XII. includes a number of very fine vessels which Germany was building in 1914 to compete with the "Aquitania," "Olympic," and such types of British ships, in order to gain a still larger proportion of the Atlantic trade. Amongst them were the largest vessels afloat in 1921. In certain cases German companies were afterwards enabled to repurchase from the Allies some of the surrendered ships, which then reverted to German ownership. Austria had to surrender all her shipping, about 1½ million tons. This was handed over to Italy, with the exception of about 70,000 tons for France.

*Statistics.*—The world's output had reached a maximum of 3,330,000 tons in 1913, and was falling again in 1914. The tonnage

launched in the United Kingdom reached the record total of approximately 2,000,000 tons in 1913, and in 1914 it had decreased by over 10 per cent. Great efforts had been made in France, Germany, Holland, Japan and Norway, and the totals in these countries showed distinctly upward tendencies. In the United States very great fluctuations occurred; the output on the coast had fallen to 95,000 tons, and on the Great Lakes to 75,000 tons in 1911, while in 1913 228,000 tons were launched on the coast and only 48,000 tons on the Lakes.

Table XIII. shows the tonnage of ships launched in various countries from 1910–20. The diagram Fig. 44 has been prepared on the basis of these figures. The striking results obtained in the British colonies and Japan will be noted, and the overwhelming influence of U.S. shipbuilding. Many of the American yards which were specially constructed for war purposes were in 1921 being closed,

while others were falling back rapidly to pre-war conditions (see SHIPPING: *United States*).

In the United Kingdom, from the middle of 1915, a committee of the Board of Trade, in conjunction with the Transport Department of the Admiralty, assumed control of the British mercantile marine, including shipbuilding. A Merchant Shipbuilding Advisory Committee was formed, with Sir George Carter as chairman. In Dec. 1916 the Ministry of Shipping was set up, under Sir Joseph Maclay. The Shipbuilding Advisory Committee was enlarged, and on its advice steps were taken to standardize the types of merchant ships to be built, and to simplify the details of construction both of hull and machinery to secure the greatest and quickest output possible.

Five types of "standard ships" were designed, varying from 3,000 to 8,000 tons deadweight, and between Dec. 1916 and April 1917 considerable numbers of these vessels were ordered. In order to harmonize the work of shipbuilding for the Admiralty and the mercantile marine, the whole was placed under one authority, Sir Eric Geddes, in June 1917, when he assumed office as controller of the Navy. Arrangements were made for setting up new shipyards with a view to producing "fabricated" ships, which could be put together with very much reduced amounts of skilled labour; but the results were disappointing, and at the end of 1918 the output in the United Kingdom was still only at the rate of 1,500,000 tons per annum. In March 1918 Lord Pirrie was appointed controller-general of

Total, World's Shipping	41.8	49.1	50.9	57.2	62.0

Largely as a result of the efforts of the United States, by the end of 1918 ships were being built at the rate of 7,000,000 tons per annum, against the pre-war record of 3,330,000 tons per annum. In June 1920 the steam tonnage of the world amounted to about 54,000,000 tons, notwithstanding the losses of the war. The total losses had amounted to about 9,000,000 tons of British ships and 6,000,000 tons others, making a total of 15,000,000 tons. Of the total, 2,000,000 tons were due to ordinary marine risks.

FIG. 44.

**Motor-Ships.**—The period 1910-21 saw immense changes in the means of propulsion. In 1911 the "Selandia" and "Jutlandia" were launched, and a number of other vessels were being built, in which internal-combustion engines of a more or less experimental character were being fitted. *Lloyd's Register* reports that by 1914 there were 290 motor-ships of 234,000 tons gross, while in 1921 there were no fewer than 1,447 ships of 1,263,000 tons gross, so that in 1921 there were nearly five times as many motor-ships in existence as there were in 1914, and the tonnage of these ships was nearly six times as great. In these seven years motor-vessels increased from 4.7 to 2.1 per cent of the world's tonnage.

Dr. Diesel's master patents expired in 1909 and 1910, and since then many successful types of internal-combustion engines have been established in Europe and in America (see INTERNAL-COMBUSTION ENGINES), and the proportion of motor to steam vessels building rapidly increased. In June 1921 183 motor-vessels of 502,944 tons were under construction, and out of this number 57 of 241,003 tons were being built in the United Kingdom.

**Oil Burners.**—Another very great improvement is in the use of oil instead of coal under steam boilers. *Lloyd's Register* reports that in 1914 364 vessels of 1,310,000 tons were fitted to burn oil, but in 1921 these had increased to 2,563 ships of 12,797,000 tons, or from 2.62 to 20.65% of the world's tonnage. In the United States four vessels burn oil to every three vessels burning coal. This use of oil fuel has demanded a large increase in the number of oil-tank steamers. In 1914 there were 385 tankers of 1,479,000 tons, while in 1921 there were 861 tankers of 4,419,000 tons, an increase from 2.94 to 7.16 per cent of the world's tonnage.

**Electric Drive.**—It has been the almost universal practice for submarines to be propelled by electric motors when submerged. In a few cases of small surface vessels electric drive had also been used prior to 1910. The earliest recorded appears to be Nobel's tank vessel "Sarmat," fitted with the system in 1904. About 1910 a small vessel named the "Electric Arc" was built on the Clyde to test the method of electric transmission devised by Mavor, using Squirrel cage motors. The experiment was not altogether a success, but it gave a good deal of experience. Mavor proceeded to America and discussed his ideas with Emmet, and no doubt assisted Emmet in the great undertaking carried out for the American navy in the collier "Jupiter" (now aircraft-carrier "Langley"). The American navy built three colliers at this time of identical dimensions, about 20,000 tons displacement, 7,500 H.P., 15 knots full speed, and cargo 12,000 tons. The "Cyclops" has two reciprocating engines, the "Neptune" has Parsons turbines and a West-

inghouse floating frame mechanical gearing, while the "Jupiter" was fitted with a Curtis turbo-electric generator, running at 2,000 revolutions, giving alternating current at 2,200 volts, and motors driving two propeller shafts at 110 revolutions. The reported engine room weight of the "Jupiter" is 223 tons, compared with 343 tons in "Cyclops" and 189 tons in "Neptune."

Mavor's next step was to fit up an installation of 1,500 S.H.P. in the "Tynemouth," built by Messrs. Swan, Hunter & Co. in 1913. This vessel was 250 ft. long, 1,644 tons gross, and of about 8 knots speed. This system, however, did not admit of development on a large scale.

The next important progress was made in Sweden, where two sister vessels were built, 225 ft. x 36 ft. x 15½ ft., 2,250 displacement, 975 tons gross. Each was provided with 900 H.P. for 11½ knots. In the "Mimer" triple expansion reciprocating engines were fitted. In the "Mjolner" Ljungström turbo-generators running at 800 r.p.m. were fitted, with two motors of 450 H.P. each, and geared to a single propeller shaft running at 85 r.p.m. It was reported that fuel consumption was reduced by over 40%, to .89 lb. per I.H.P. per hour, and that a saving of 74 tons in weight was effected. A large number of other vessels have since been fitted on the "Ljungström" system. These include the "Turbinia," of 2,250 tons and 1,020 H.P., built in 1916 in Sweden, and the "Wulst Castle," of 3,566 tons and 1,500 S.H.P., built in 1918 by Blumer of Sunderland. It was reported that in 1921 there were 40 vessels building in different countries on this system with the aggregate of 70,000 horse power.

The success of the "Jupiter" was so great that electric transmission was adopted by the U.S. navy for a great many of their later ships, even of the highest power. The next great experiment in electrical propulsion was put in hand by the U.S. Shipping Board, who decided to remove the mechanical gearing in 12 vessels and fit an electric drive instead. The first vessel taken was named "Eclipse," the next three vessels "Archer," "Independence" and "Victorious." The "Eclipse" is 440 x 56 x 35.2, of 7,589 tons gross and 11,900 dead-weight. The boilers are fitted with Dahl oil burners, steam 215 lb. and 200° super heated. One turbine of the Curtis Impulse type is fitted to run at 2,000 r.p.m. A three-phased generator supplies current at 2,300 volts. An induction motor is fitted directly on the propeller shaft working at 2,300 volts and running at 100 r.p.m. for 3,000 H.P. The speed may range from 20 to 110% of the normal. The result of the trials was very gratifying. The reports as to the first voyage were not quite so good. The other three vessels named had not yet gone on service in 1921.

Another very interesting case is that of the "Cuba," a vessel 310 x 40 x 26.9 of 2,963 tons gross. This vessel has also been fitted with a turbine electric drive by the General Electric Co., Schenectady, but in this case a synchronous motor is fitted. Steam of 190 lb. with 200° super heat is supplied to an 8-stage Curtis turbine, as in "Eclipse." This runs at 3,000 r.p.m. and 1,150 volts. The motor gives 3,000 H.P. at 100 r.p.m. and 1,150 volts, and is fitted directly on the shaft. The trials of this vessel were well reported on. Both vessels are of 11 knots speed.

The question of the efficiency and economy of the electric drive was being very much discussed in 1921. On the one hand it was said that the transmission loss of the electrical system was 8% instead of 3% with the mechanical current, but the other ships with electrical current reported very good economy of fuel.

**Wood Vessels.**—In 1914 wood vessels amounted to 1% of the total steam tonnage, but owing to the special building during the war it had risen to nearly 4% in 1921. Of this large increase the United States owns one million tons.

The Emergency Fleet programme provided for ordering 1,067 wooden and composite ships, of 3,227,200 tons; but only 607 of 1,948,250 tons were actually produced. In June 1921 288 cargo carriers remained in the possession of the U.S. Shipping Board, 15 being on active service and 273 tied up. The board also had 14 tugs, of which 9 were on active service. Up to this date 211 had been sold, 12 of which had been built for service as cargo carriers and 61 as tugs. One had been fitted for carrying oil in bulk. Seventy-four were incomplete when sold. In Aug. 1921 the remaining wooden vessels were reported to be sold to the Ship Construction and Trading Company.

**Concrete Ships.**—Prior to the war a number of small vessels for harbour or river service had been built of ferro-concrete in Italy, Norway and France. During the war a few experimental vessels of small size were built in various places, and the system was adopted to an increasing extent, practically all over the world. As larger vessels were built, the methods received careful consideration, and by proper development vessels up to 7,500 tons dead-weight were successfully produced. The complication of rods and ties in the larger vessels became very great, and sectional or panel systems were introduced, as contrasted with the usual monolith system. The reports as to results varied. The weight of hull was reported to be from 50 to 100% more than for steel, or about equal to wood; while the saving of steel for carrying a given dead-weight amounted to 55 to 66% of the steel ship. This was an enormous advantage during the steel shortage, and a further advantage was the power to build by a new class of labour, giving a greater aggregate of labour for shipbuilding. The most notable vessel was perhaps the S.S. "Faith," built by the San Francisco Shipping Co. in 1918.

This vessel, 320 ft. long, 3,427 tons gross, and fitted to burn oil fuel, was a great success. On arrival in England with a cargo the holds were found to be absolutely dry. Table XV. gives the total tonnage recorded of vessels of this type.

TABLE XV.—*Ferro-Concrete Vessels Included in "Lloyd's Register," 1921-2.*

Country	Steam and Motor Vessels		Sailing Vessels		Total	
	No.	Tons	No.	Tons	No.	Tons

Total	50	89,598	50	33,043	100	122,641

**Large Liners.**—Particulars of notable Atlantic liners of recent construction are given in Table XVI. When the "Lusitania" was sunk during the war, the "Mauretania" (30,704 tons) was the only pre-war 25-knot Atlantic liner left. She was followed, however by the "Aquitania" (45,647 tons), of 24 knots, launched by John Brown & Co., for the Cunard Co. in 1914, and the "France," of 23,666 tons gross, launched at St. Nazaire for the Cie. Générale Transatlantique in 1912. The "France" had turbines of 45,000 H.P. on four shafts for her 24 knots, and carried 1,926 passengers besides her crew of six hundred. The "Aquitania" was completed during the war as a hospital ship, but saw very little service as such. After the war she was overhauled and fitted to burn oil fuel, so as to carry 3,250 passengers.

In 1917 another great French liner was launched, the "Paris," of 33,700 tons; it was not completed until June 1921. She could carry 98 passengers in *cabins de luxe*, 468 first-, 464 second-, 1,100 third-class (in cabins), also 1,100 stowage in open berths—the total, including crew, amounting to 3,900 persons. She was fitted with four screws driven by Parsons' turbines, manufactured at Havre. During completion she was modified to burn oil fuel on the Wallsend-Howden system. On her first trip, with 12 boilers out of 15 in service, she averaged 21 knots.

Of the great White Star liners, the "Adriatic," of 24,541 tons gross, capable of carrying a total dead-weight of cargo and fuel of 19,710 tons, at a speed of 18½ knots, may be taken as typical. A later ship, the "Belgic," of 24,547 tons gross, which was put prematurely into service during the war (1917), could carry 22,025 tons at the same speed. The "Adriatic," "Baltic," "Cedric" and "Celtic," averaging 22,600 tons gross, with a total dead-weight capacity of over 55,000 tons, became well known to Atlantic passengers as the "Big Four."

The White Star policy of combining comfort for passengers with a large cargo-carrying capacity found its highest expression, however, in the "Olympic," of 46,359 tons, launched by Harland & Wolff in 1911. She could carry a total of 12,770 tons dead-weight on a draught of 34 ft. 7 in., with a displacement of 52,300 tons, and could take 2,400 passengers, besides her crew of 900, across the Atlantic at 21 knots. Having been altered to burn oil fuel, she could take sufficient at New York (7,500 tons) to provide for the double journey. Her maximum speed is 23½ knots at 55,000 horse power. The "Olympic" was in 1921 the biggest British-built vessel, but her dimensions had been exceeded by the "Britannic," of 48,158 tons, which was launched by Harland & Wolff in 1914, and was sunk in Greek waters while serving as a hospital ship in 1916.

Still larger, however, were the three great liners built in Germany during 1912-4. The largest of these (and in 1921 the largest in the world), the "Majestic," (fig. 45) launched by Blohm & Voss in 1914, and acquired by the White Star for entering service in 1922, is of 56,000 tons gross. Turbines of about 100,000 H.P. on four shafts, the greatest installation yet fitted in any merchant vessel, give her an ocean speed-capacity of 23 knots. She is 956 ft. in length, 100 ft. in width, and 102 ft. in height from keel to boat deck. Parsons' turbines, arranged for triple expansion, are fitted on four shafts, and steam is supplied by Yarrow water-tube boilers at 260-lb. pressure. The machinery weighs 8,500 tons, and 5,700 tons of fuel are consumed on one trip. The funnels come up the side of the ship, joining together above, and thus leave the central part clear for dining-halls, etc. The ventilation involves 18 m. of piping, while there are 15,000 electric lamps, and 225 electric motors for various purposes, requiring a total of 1,565 horse-power. She can carry 4,000 passengers, while the food for one voyage includes 12 tons of fresh meat, 12 tons of vegetables, 14 tons of milk and about 5 tons of eggs.

Amongst the latest additions to the White Star line up to 1921 was the "Homeric," of 35,000 tons, carrying 2,700 passengers at 21 knots; she was launched at Danzig in 1913 as S.S. "Columbus." The "Homeric" is notable as being the last large ship propelled by reciprocating engines only, of which she has two sets, triple expan-

sion, cyls. 50½ in., 86½ in. (2), 96 in. and 70 in. stroke; but these were exceeded in size by those of the "Britannic," (fig. 46) which were 54 in., 84 in. (2), 97 in. and 75 in. stroke, to give 32,000 I.H.P. on two wing shafts, and in addition "Britannic" had i.p. turbines to give 18,000 S.H.P. on two central shafts. The engines of "Britannic" were probably the most powerful single sets made for an ocean liner, while the "Kronprinzessin Cecilie" (now "Mount Vernon") had the greatest total I.H.P., as she had two sets of 4-cyl. engines on each shaft; they were 37½ in., 49 in., 75 in., and 112 in. (quadruple expn.) and 71 in. stroke. Other new vessels being added by the White Star line are:—"Regina" (16,314 tons), and "Rimouski" (9,281 tons) for Canadian service;—"Laurentic" (18,000 tons), "Doric" (16,600 tons) and "Pittsburgh" (16,600) for U.S. services.

The Cunard Co. acquired the "Berengaria" (formerly "Imperator") of 52,022 tons, launched by Vulcan Works, Hamburg, in 1912. This vessel has Parsons' turbines of 60,000 H.P. on four shafts and can attain a speed of over 22 knots with 185 revolutions. She carries 4,000 passengers and a crew of 1,200.

The Cunard Co. decided immediately after the war to build a large number of intermediate vessels somewhat of the "Olympic" type, but smaller and of less speed. The first four were 600 ft. ships of about 21,000 tons gross and 27,000 tons displacement, at 30-ft. draught, and were named "Scythia," "Samaria," "Franconia," "Laconia." The "Samaria," (fig. 47) which may be taken as typical, was built by Cammell Laird & Co. in 1921. Her engines (turbines) are fitted with double helical speed reduction gear, to drive the propellers at an economical speed. The boilers are of the cylindrical type, fitted to burn oil fuel with forced draught on the Wallsend-Howden combined system. They will give steam at 220 lb. with 200° F., superheated by means of Schmidt's smoke-tube type of superheater. Her twin screws are operated by Brown-Curtis turbines, which run at 2,750 revolutions. Triple expansion is arranged for as follows: On each side of the ship a H.P. and I.H.P. turbine are fitted in tandem on the shaft of the first driving pinion, and the I.P. turbine is fitted on the shaft of the second driving pinion of the first reduction gear, both then operate through the second reduction gear and give the propeller shafts a speed of 90 revs. per minute. The total S.H.P. of 13,500 gives a sea speed of 16 knots. The astern turbines are compound, and are incorporated in the exhaust casings of the intermediate and low-pressure ahead turbines, and give a total power equal to about 70% of the ahead power. This may be taken as typical of the best turbine arrangements of 1921. The "Samaria" can carry about 350 first-, 350 second- and 1,600 third-class passengers. Her deck machinery is driven by electric power through hydraulic variable-speed gear at each of the machines. Two large sets of turbo-driven generators are provided for this purpose, and an oil-driven emergency dynamo is also fitted. A gyro-compass installation is fitted, the master compass being on one of the lower decks, with three separate controlled compasses at suitable positions for navigation. Her subdivision is on the most approved principle, with increased numbers of watertight bulkheads, the water-tight bulkhead doors being operated on the Stone-Lloyd hydraulic system. She is further subdivided by fireproof bulkheads, and the "Grönwald" system of fire extinguishing is installed. Electric passenger hoists are provided.

Among great pre-war German liners which came into the service of U.S. shipping companies were the "America," of 17½ knots and 22,622 tons, launched by Harland & Wolff, Belfast, in 1905, and the "George Washington," (fig. 48) of 18 knots and 25,570 tons, launched by the Vulcan Works, Stettin, in 1908. In addition, the "Leviathan," of 54,282 tons, and 21 knots, launched by Blohm & Voss, Hamburg, in 1914, was still in 1921 awaiting renovation and allocation to service. During the war these great vessels were utilized to transport immense numbers of American troops across the Atlantic. For this service they were specially prepared and ballasted, and, on sailing, the "Leviathan" had what may perhaps be a record draught for a vessel leaving port, viz. 40 ft. 11 in. "Leviathan" carried as many as 11,000 troops on a single trip.

Among American liners the place of the old "St. Paul" has been taken by ships of the "State" class, which were started as 522-ft. troopships (fig. 49). The first on the Atlantic service were the "Pamphile State," and the "Old North State," vessels of 10,500 tons, completed in 1920. There were five other vessels also of the same type, 522 ft. overall, with 502 ft. between perpendiculars. Supplemented by the great ex-German ships named above, they enabled the Shipping Board to send their faster (535 ft.) State type of vessel to the Pacific.

Germany in 1921 retained the old "Deutschland," which had now only machinery for 15½ knots, and was named "Hansa." Just prior to the war Germany was building a series of splendid vessels, most luxuriously fitted out, and supplied with every modern device for the attraction and comfort of passengers in order to capture the S. American trade. They were fitted with a combination of reciprocating engines and turbines. The best-known vessel, "Cap Trafalgar," 18,710 tons, 17½ knots (1913), was, as an armed merchant cruiser, met and sunk after a stiff fight by the Cunarder "Carmania," also fitted out as an armed merchant cruiser. Other vessels of the type were the "Cap Finisterre," 14,503 tons, 17 knots, (1911) (now the "Taiyo Maru"), and the "Cap Polonio," 19,500

tons, 18 knots (1914). The last had specially luxurious apartments to fit her for the use of the ex-Kaiser, but after the war British owners could not run her at a profit, and she was sold back to Germany, and was, in 1921, far the best and fastest German steamer. France replied with the "Lutetia," 14,654 tons (1913), and the "Massilia," 15,147 tons (1914), both having a combination of reciprocating engines and turbines for 20 knots.

The "Esperia," of 11,393 tons, the finest passenger vessel built as such in Italy, was launched at Genoa in 1921. She is fitted with Parsons' turbines, of 19,600 H.P., on two shafts, with mechanical reduction gearing, for 21 knots, and carrying 480 passengers in addition to a crew of three hundred. Italy also ordered two fine vessels in Great Britain. One, the "Conte Rosso," built by Beardmore, Dalmuir, was requisitioned by the Admiralty, razed to give an uninterrupted flat deck, with no funnels, and fitted out as the aircraft-carrier "Argus." She was finished just before the Armistice. To take her place another vessel of the same name was launched in 1921 by Beardmore, 15,500 tons, 18½ knots speed, dimensions 570 ft. x 74.2 ft. x 36.1 feet. The second vessel, "Giulio Cesare," laid down by Swan, Hunter & Co. at Wallsend, stood half plated during the war, and was finally completed in 1920, 21,500 tons, 18½ knots sea speed. In her the fitting-out of the German "Cap" vessels was rivalled by a combination of British and Italian art, and this vessel was in 1921 the largest and finest Italian liner, and the

finest vessel trading to S. American ports. She has four sets of turbines of 21,900 H.P. with single reduction gearing driving four propellers, giving a speed of 19½ knots speed on trial, and carries 243 passengers in *de luxe* state-rooms, 306 second-class, 800 steerage and a crew of 520, giving a total of 1,869.

Spain had two fine vessels built just before the war, the "Infanta Isabel de Borbon," of 10,348 tons, 17½ knots, launched by Denny at Dumbarton (1913), and the "Reina Victoria Eugenie," 10,137 tons, launched by Swan, Hunter & Co. (1913), 17½ knots, and of about the same general dimensions. Both are fine well-fitted vessels, and both have a combination of reciprocating engines and turbines of 10,000 H.P. for propulsion at 17½ knots speed. Spain also built herself vessels of a steadily improving class. The "Alfonso XIII." (of 10,137 tons gross), built in 1921 at Bilbao, was the finest vessel yet constructed in Spain. Her dimensions are 480 ft. x 61 ft. x 41 feet. She is fitted with two sets of geared steam turbines of 10,300 S.H.P., giving 14 r.p.m. at the propellers, and a speed of about 17½ knots.

Particulars of notable recent Pacific liners are given in Table 17. The wonderful development of what might be spoken of as secondary liners is illustrated by the new vessels built for the Canadian Pacific railway (now Canadian Pacific Ocean services). The "Empress of Canada," of 22,000 tons and 22 knots, built in 1920 by Fairfield will be the finest vessel on the Pacific Ocean.

TABLE XVI.—Particulars of Notable Atlantic Liners.

Name	Tons gross	Speed Knots	Owners	Date of build.	Dimensions L B D	Dead-weight Tons	Horse-power	No. of screws	Types of Machinery and Makers	Steam pressure lbs.
"Mauretania"	30,704	26.6	Cunard Co.	1907	762.2 x 88 x 57.1	12,280	70,000	4	Parsons' turbines	105

The U.S. Shipping Board has allotted many of its best vessels to various companies for service on the Pacific. The "Wenatchee" and "Creole State" are typical of the 535-ft. vessels so appropriated. These vessels are 535 ft. overall, 516 ft. between perpendiculars, with a beam of 72 ft., and moulded depth 27-8 ft., and to "A" deck 50 ft.; about 14,000 tons gross. When loaded to a draught of 30-6 ft. their total dead-weight is 10,000 tons, and total displacement 21,250 tons. They have accommodation for 257 first-class and 300 second-class passengers, besides 200 of ship's company. They can also carry 6,700 tons of cargo, and can maintain 17½ knots for long distances, having obtained over 19 knots in some cases on trial. They are fitted with water-tube boilers 265 lb., and 730 superheat. Westinghouse double-flow type turbines are fitted, run at 3,650 revolutions, with double reduction gearing, to drive two propellers at 110 revolutions. The smaller vessels of the same type are 522 ft. overall, 502 ft. between perpendiculars; breadth 62 ft. and depth to "A" deck 42 ft. They only carry 78 passengers, but they can take another 1,000 tons of cargo. They are fitted with cylindrical boilers 220 lb., and two sets of four-cylinder triple expansion engines giving 6,000 H.P. for 14 knots at 105 revolutions.

For service between Europe and Australia, via The Cape, the "Ceramic," of 18,481 tons and 17 knots, triple screw, of the White Star line, was the finest and largest vessel running in 1921. She was built by Harland & Wolff in 1913, and can carry 19,590 tons cargo, and bunkers, at a sea speed of 17 knots, with a maximum of 18½ knots. For the India and Australia service of the P. & O., a new series of "N" class of steamers was being built. The first of these "Naldera," 15,825 tons, was built by Caird, and used by the Government during the war. "Narkunda," 16,118 tons, was the first liner to be completed by Harland & Wolff at Belfast after the war. These are vessels of 18½ knots speed. For the India service direct a new series—"M" class—was being built. Typical of these is the "Mongolia," built by Armstrong, 550 ft. x 72 ft. x 42-3 ft. When loaded to a draught of 30 ft. they will have a displacement of 24,500 tons, and 15,550 tons gross, and carry a dead-weight of about 13,000 tons. They can carry over 400 first- and second-class passengers, and of seven cargo-holds two are insulated. Two later vessels—"Maloja" and "Mooltan"—are 20,700 tons gross.

The Cunard Co. has also built a number of vessels of the "Ausonia" type for the Cape and Australia services. These vessels are 519 ft. x 65-3 ft. x 43 ft., and 13,000 tons gross at a draught of 29-6 feet. Their displacement is 20,420 tons with a dead-weight of 10,120. Geared turbines of 8,500 H.P. are fitted for a speed of 15 knots. They can carry over 500 cabin passengers and about 1,200 third-class. The "Ausonia" is remarkable as making a record of 1,000 ships built by Messrs. Armstrong, of a total of 3,000,000 tons. Of these, 800 were merchant ships and 200 were warships.

The Australian Government was in 1921 providing itself with seven liners of 12,500 tons, 15 knots full speed, built on the Isherwood longitudinal system. The "Largs Bay," built by Messrs. Beardmore, may be taken as typical of all five. She is 530 ft. long, breadth 68-3 ft., depth 38-8 ft., 12,500 tons gross tonnage, and can carry 12,000 tons dead-weight at a draught of 29 ft. 9 in. and displacement 23,120 tons. She can carry 730 third-class and about a dozen first-class passengers. Machinery, of 9,000 S.H.P. on two shafts, is provided for a speed of 15 knots; Parsons' geared turbines are fitted in two complete sets. The h.p. turbines run at 3,200 revolutions, and l.p. turbines at 2,100. They are independently connected to the shafts by double reduction gearing 35-5 to 1, and 23-4 to 1 respectively, giving a speed of propellers of 90 revolutions per minute, and on each ship astern turbines are provided equal to 60 to 65% of the full power ahead.

**South Africa.**—For the direct service to the Cape the Union Castle line added the "Balmoral Castle," of 13,361 tons, of 18 knots maximum speed, in 1911. Two very fine vessels had in 1921 been recently added; the "Arundel Castle," and "Windor Castle," 650 ft. x 72 ft., and of 19,000 tons gross. They were the first four-funnelled ships on the Cape line, and were fitted with 15,000 H.P., and single reduction gear, to two shafts, for a sea speed of 17 knots. They could carry 273 first-, 224 second- and 566 third-class passengers, besides the crew of 400, and a large cargo, the total dead-weight being 14,000 tons.

**Coast and Channel Steamers, etc.**—The finest recent vessels of these types have been built in America. Two remarkable vessels, the "Great Northern" and "Northern Pacific," built by Cramp in 1915 for service between San Francisco and Astoria, are 8,255 tons gross and 24 knots speed. They are 500 ft. x 63 ft. x 50-5 ft., moulded, to promenade deck. When loaded to 21-ft. draught they have dead-weight of 2,185 tons and displacement of 9,700. They carry 550 first-class passengers and 316 second and third-class passengers. They are fitted with 12 water tube boilers of the Mosher type, and Parsons turbines driving three screws, and giving 22,000 S.H.P. These were, perhaps, the finest vessels that had yet been built in the United States, though not the largest.

New Channel steamers have continued to be built in England, France and Belgium. The fastest steamer on the English Channel service in 1921 was the "Versailles," built in France and completed in 1921, 305 ft. long and 36 ft. in breadth; she had obtained 25 knots on speed.

An important type of cross-channel steamer is the train ferry. During the war such vessels were used by England for the first time. These vessels are 363-5 ft. long, 61-5 ft. broad, draught 9 ft. forward and 10 ft. aft. They displace 3,654 tons, and have 12 knots speed. Two were built by Messrs. Armstrong and one by Messrs. Fair-

field. On the deck, well protected by deckhouses, are four lines of rails, which will take 54 10-ton wagons. Heavy guns and heavy machinery of all description were transported by these vessels.

Some of the most remarkable vessels in the world are the Sound and Lake steamers of the United States. Recent vessels on the Lakes are the largest paddle steamers ever built, such as the "City of Cleveland III." (1907), 4,568 tons and 19 knots speed; "City of Detroit III." (1912), 6,061 tons and 20 knots speed; and "Seand-see" (1912), 6,381 tons, 19½ knots. This last remarkable vessel is 484.5 ft. x 58.1 ft. x 24.0 ft. To drive her paddle wheels she is fitted with compound, three cylinder engines; cylinders being, one 66 in. in diameter, and two 96 in. in diameter, with a stroke of 9 feet.

**Developments in Shipbuilding.**—The greatest innovations during 1910-20 were in connexion with rapid shipbuilding during the war. The production of "standard ships" in Great Britain has been already referred to. Six types were "standardized" (see Carter I.N.A., 1918, and, for detailed summary with dimensions, *Ship-builder*, May 1918).

Others were approved at a later date, and permission to build large numbers of such ships was given to various shipbuilders. In these ships special methods were adopted to reduce risk of submarine attack, such as improved sub-division, making both ends alike, with bridge, poop and forecabin ends rounded, funnels and main symmetrical in profile elevation with regard to a vertical line amidships, but not on the fore and aft centre line so as to increase difficulty of detecting speed and course of vessel. Very greatly improved accommodation for ship's company was also provided.

The best method of expediting the building of merchant ships occupied many minds, and proposals were made by Sir Eustace d'Eyncourt in 1917 to simplify the construction of war-time vessels by making all frame-lines straight, and the plating so far as practicable of developable surfaces. A successful design was proposed on this basis, and adopted by the Controller of Merchant Shipbuilding for use in the fabricated ships about to be built at the National Shipyards on the Severn. The first fabricated "straight line ship," the S.S. "War Climax," was completed at Wallsend by Swan, Hunter & Co., on Sept. 28 1918, 31 weeks from laying keel.

In Great Britain large numbers of vessels of standard designs were built by various shipbuilders according to their usual routine. The "fabricated" ship followed later. In the United States, however, the standard ships were mostly fabricated ships also. The first series were produced by the Submarine Boat Corporation in new premises at Newark Bay. The most wonderful of all the American shipyards was, however, at Hog's I., Philadelphia, which in less than 12 months passed from open 50 ft. ground to the greatest shipyard in the world, with full equipment and deep water jetties. The contract was signed on Sept. 13 1917, and work started Sept. 20. The first keel (S.S. "Quistconck") was laid Feb. 12 1918, launched Aug. 5 1918, and by Jan. 8 1919, 16 vessels had been launched and 7 completed, 50 ships had been built and 7 jetties, 1,000 ft. long and 100 ft. wide for fitting out afloat. By April 17 1920, 102 ships of 800,000 tons d.w. had been launched and 84 of 657,000 tons completed. The fabricated parts were prepared in 90 engineering works from 10 to 1,500 m. away.

**Ferro-Concrete Ships.**—For many years small vessels had been built of reinforced concrete in localities where steel and the special labour required for steel shipbuilding was not available. Such vessels had been built in Italy, Norway and France. Between 1887 and 1917 some 200 craft had been built, but in the latter year the subject was more seriously considered, and craft of increasing size were built, and greater numbers of them fitted with propelling machinery. In England 1,000 ton barges, tugs of 750 h.p., and cargo steamers of 1,150 tons d.w. were built. The first steamship, "Armistice," was built at Barrow, and was reported to run well and cost very much less than a steel ship for upkeep. In Great Britain most of the concrete vessels were tow barges, but in a number of cases steam or oil engines were fitted. Cargo boats 1,150 tons d.w. 203 ft. x 32 ft. with engines of 350 I.H.P. for 7½ knots, and tugs 125 ft. x 27 ft. 6 in. with engines of 750 I.H.P. were built. In the United States very much larger vessels were built as experience was gained. The S.S. "Faith" was 320 ft. x 44.5 ft. x 30 ft., d.w. 3,950 tons on 22 ft. 6 in. draught, triple expansion engines of 1,600 I.H.P. were fitted giving 10½ knots speed. Others were built of 3,000, 3,500 and 7,500 tons d.w. as well as eight oil tankers of 7,500 d.w. The Emergency Fleet Corporation ordered 56 ships of an aggregate d.w. of 300,000 tons, besides 34 barges and lighters.

**Welded Ships.**—The Oxy-Acetylene process, for cutting out damaged portions of ships and machinery, and for welding in portions in the course of repair, has been of great service, particularly for the repairs of large forgings, castings and boilers. To a less extent the "Thermit" process has been used for welding purposes, but its application has been of a comparatively limited character. During recent years very considerable progress has been made in developing systems of electric welding, which were used to carry out repair work of considerable magnitude during the war. It has also been proposed that the complete ship should be welded, thus avoiding a great portion of the labour and expense of riveting. Several systems have been developed which can be operated in the ordinary shipyard, and considerable progress has been made in Sweden, England, the United States and France. In 1915 a small vessel

was built by Geary at Ashtabula Harbour, Ohio. This vessel was 42 ft. long, 11 ft. beam and 6 ft. 6 in. draught, and the welding was carried out with bare metallic electrodes. Two vessels of 52 to 62 ft. in length have also been built, one in France in 1919 and one in 1920 in Sweden "Esab IV." In each case the welding was carried out by the Kjellberg process, and each of these craft is propelled by semi-Diesel crude oil engines, which can also be used to provide electric power for welding, and compressed air for use in carrying out the repairs of ships by this process as they float in harbour. In this process the arc is also used, but a fireproof sleeve of non-conducting material projects over the arc so as to shield the molten metal from oxidation. A boiler 15 ft. 6 in. in diameter, known as the Hawthorn-Wyber boiler, has been successfully constructed by means of this process. The process of the General Electric Co. is quite different; in this case metallic contact takes place, the welding material is raised to the necessary temperature by resistance to the passage of the current, and it is at the same time pressed into place by hydraulic pressure. A 46-ft. section of a 9,600 ton vessel being built in New Jersey has been used to test the practicability of this, and other methods, and it is reported that these experiments show a saving of 60% on labour and 15% on material, as compared with riveted work.

During the war a steel barge, 120 ft. by 16 ft. and 275 tons displacement, was built at Richborough, Kent, in order to test to what extent labour could be saved. Here the Quasi-Arc process was used and the vessel was satisfactorily completed. On this system the steel electrode has a sheath of blue asbestos, which melts and flows down over the molten metal, thereby extinguishing the arc. This asbestos also forms a floating covering over the molten metal and protects it from oxidation. In order to give further protection, an aluminium wire is carried down by the side of the steel electrode, so that the molten aluminium may take up any oxygen which gets beneath the flux. Messrs. Laird built a small sea-going vessel, the S.S. "Fullagar," in 1920, using the Quasi-Arc process. If welding can be adopted as the general practice, a very large saving should arise in the cost of labour, and an appreciable saving in the case of weight and material.

FIG. 50.

**Isherwood System.**—For many years warships have been built on the longitudinal system of framing, i.e. the principal structural members of the framing run fore and aft in continuous girders, the transverse framing being of a secondary character (apart from bulkheads), and fitted between the longitudinal girders as necessary for local support. This system of framing has not found general acceptance for merchant ships, because of the theory long held by shipowners that a merchant ship must have such strong transverse frames that she may ground in an ordinary berth with a cargo on board and without damage. With the improved wharf accommodation now available for important vessels this idea is being gradually relinquished. The most important movement in this connexion was inaugurated by Mr. (later Sir) Joseph Isherwood, who devised a plan for utilizing the whole of the framing of the bottom of the ship and of the decks so that it might be incorporated as part of the structural girder strength of the ship. In 1908, six ships were built of 31,000 tons; for the next six years, 40 or 50 ships were built per annum; but in 1915, under war conditions, the number very greatly increased, and in 1918, 250 ships of nearly 2,500,000 tons dead-weight capacity were built. Clearer holds, greater strength and a saving of about 10% of weight of structure are obtained, as well as decreased cost of building. By June 1921 1,400 ships, aggregating 12,000,000 dead-weight, had been built on this system.

The combination of a longitudinal system in the double bottom, and a transverse system above the bottom, has been adopted by Mr. W. Millar of Greenock, and several vessels have been built on the Millar system. Other systems in which a longitudinal construc-

tion is adopted are associated with various names—Mr. Foster King, Dr. Montgomery, and Sir Westcott Abell.

The "Unsinkable" Ship.—A so-called "unsinkable" ship has been designed by M. La Parmentier. It consists of two cylinders, 22 ft. in diameter and about 300 ft. in length, each divided into 7 holds, connected so as to form a vessel 320 ft. in length and about 48 ft. extreme breadth, estimated to carry 4,250 tons d.w. on a draught of 16 ft. fitted with twin screws, and engines of 700 H.P. for eight knots. In 1921 several such vessels were being built in the United States.

*Cruiser Sterns.*—Several of the new liners have a rounded stern, with the profile sloping forward in a curved line as it rises from the water upwards. This is called a "cruiser stern," and is being very generally adopted. It gives somewhat increased capacity, and with the same total length of ship provides a longer water-line, thus facilitating propulsion. In the case of a 550-ft. ship, for 18 knots this meant a decrease of 2,000 H.P., which resulted in a saving of 225 tons of machinery, as well as 220 tons of fuel per trip, giving a saving of over 400 tons available for extra cargo. In 1921 over 160 vessels were built with sterns formed in this way.

On this system the flat plate rudder is replaced by two curved plate rudders ("Kitchen rudders"), forming an almost cylindrical casing round the propeller. By revolving these curved rudders as desired the stream of water is directed as necessary by reaction to steer the ship. For going astern the rudders are brought together abaft the propeller.

*Safety at Sea.*—During the war many other points were developed for increase of safety in navigation, such as use of range-finders, directional wireless, gyro-compasses, reflex sound apparatus, "clear view" weather screens, submarine sound signalling, and "Leader" cables laid along the bed of the channel.

Following the loss of the "Titanic" on April 16 1912, rigorous enquiries were conducted, in New York under Senator W. A. Smith of Michigan, and in London under Lord Mersey. In both cases recommendations were made that liners should have boats for all, regular boat drill, more efficient W.T. arrangements, and improved sub-division in construction. The British Board of Trade appointed two committees. Sir Archibald Denny presided over the first committee (Bulkheads and Sub-Division) and Sir John Biles over the second committee (Boats and Davits). As a result the Board of Trade laid draft rules before Parliament (Paper Cd. 6402 1912) and took immediate action to improve the supply of boats, while shipowners proceeded to improve the sub-division of their ships. An International Convention was called with a view to similar treatment of these questions by all maritime powers. This Convention was signed on Jan. 20 1914 and rules embodying the agreement as to life-saving appliances were immediately put into force in Great Britain (Parliamentary Paper 219 Merchant Shipping Life-Saving Appliances dated May 8 1914). The whole Convention was discussed in Parliament, and an Act was passed (Aug. 10 1914) authorizing its adoption, but the Board of Trade was left with the power to decide the date on which the Act was to be put into operation. On account of the war, action was postponed, but discussions were proceeding in 1921 between the principal maritime powers with a view to the holding of another Convention.

During the war a great demand arose for improved life-saving appliances. The most successful of all these was the Carley Life Raft, made in the United States. It is made in various sizes. A large copper pipe is bent into the form of an O, brazed up to be airtight, surrounded by cork and canvas, provided with a strong rope netting to form a floor within the O, and fitted with hand ropes, etc. This type was the means of saving very many lives; for instance, a float 9 ft. by 14 ft. will support more than 60 people.

*Research and Experiment.*—Increasing attention is being given to the study of naval architecture and marine engineering, and of research, in America as well as in Europe. Chiefly owing to the advocacy of Sir W. H. White, and the generosity of Sir A. F. Yarrow, a national experimental tank has, in England, been provided at the National Physical Laboratory at Teddington. The experiment tank is intended for the service of any shipbuilding or ship-owning firm. Primarily intended for the experimental investigation of any problems connected with ship resistance and propulsion, it has successfully dealt with such different problems as the manoeuvring of ships, torques on rudder heads, skin friction, resistance due to rough seas, rolling and pitching of ships, stability of ships and hydroplanes in motion on the water, and the form of flying-boat hulls for efficient and stable action in getting on and off the water. During the war it dealt with many problems, including the detection of submarines, mine-sweeping, torpedo firing, design of anchored mines, protection against torpedoes, and the design of standard ships.

(E. T. D'E.)

**SHIPPING** (see 24.983).—In the decade following 1910, the influence of the World War had a profound effect on the shipping industry. Nor can it be limited to the period between the beginning of Aug. 1914 and Nov. 1918, when the Armistice was signed. For many months after the cessation of hostilities, a great strain was imposed on the British mercantile marine in the repatriation of millions of men. Goods which could not be trans-

ported during the war were waiting in vast accumulations to be carried, and in 1921 the effects on shipping were still being shown. In fact, so far-reaching were the effects that they were certain to be felt for many years.

### (1) UNITED KINGDOM

The year 1910 was, judged by the ideas then ruling, a comparatively satisfactory one for British shipping, although the industry did not entirely escape the consequences of a strike of coal-miners caused by difficulties traceable to the operation of the Eight Hours Act. In 1911 there were a number of industrial disturbances, notably in the collieries, on the railways, at the docks, among seamen and in the cotton-mills. Yet rates of freight were on a higher basis than for some years previously. The time charter rate, *i.e.* the monthly rate of hire per ton dead-weight for ordinary cargo steamers, may be taken as a good barometer of the condition of freight rates generally. As compared with a rate of about 3s. a ton, or rather more, ruling in 1910, the time charter rate rose to about 5s. in 1911. There was a further upward movement in 1912, which was regarded as a very satisfactory year for the shipping industry. Time charter rates ranged from about 4s. 6d. a ton to 7s. 6d. Employment for shipping was good, although, as some set-off to the increased rates, there was a general rise in working costs. In 1913 rates declined, partly owing to the increase in shipbuilding which had been carried out during the good years. The year 1914, destined to be one of the most important for shipping as for all other industries, opened with freights on a downward grade, and in mid-summer the industry was in a very depressed condition. All freight rates for cargo steamers were low, and the liner companies were feeling the severe competition of the German ownerships. The two great German companies in the N. Atlantic trade—the Hamburg-America and the Norddeutscher Lloyd—had been for years claiming a larger share of the passenger traffic. In the summer of 1914 the Deutsche-Australische Gesellschaft announced its intention of inaugurating a direct service from Hamburg to New Zealand. Discussions were in progress with the British shipping managers when war broke out.

*Beginning of the World War.*—Immediately a number of liners were requisitioned by the British Government for service as merchant cruisers, transports, and hospital ships. Freight markets were almost staggered by the unexpected blow which had fallen, and, at first, chartering of all sorts came to a standstill. Happily, the Government at once put into operation a scheme of war insurance on the lines of the recommendations of a committee which had been previously appointed and was presided over by Mr. Huth Jackson. These recommendations provided for the granting of war insurance on shipping by the Government up to 80% of the values. This insurance was worked through the mutual associations of shipowners which were in existence for the purpose of covering such liabilities as shipowners could not obtain under ordinary marine insurance policies. In the preparation of this scheme Sir Norman Hill, the secretary of the Liverpool Steamship Owners' Assn., had taken an active part. The shipping entered in the Liverpool Steamship Owners' Assn. represented 3,948,623 tons, and that in the Liverpool and London War Risks Assn., which included the great bulk of the liner tonnage of the United Kingdom, 6,371,329 tons.

There were also important associations of the same kind with headquarters in London and on the N.E. coast. The main result of putting this scheme at once into operation was that all ships could proceed on their voyages and others could leave without involving disaster to their owners if the vessels were captured or destroyed by the enemy. Had no such scheme been available, a great many vessels, if not all, must have been detained in port. Commerce would immediately have come to a stop. In those days it was the possibility of capture by the enemy's surface cruisers that was in men's minds: that was considered serious enough. The risk of destruction by the enemy's submarines had hardly been taken into account.

As a complement to this scheme for the insurance of hulls, there was also established a Government office for the insurance

of cargo. The marine insurance market continued actively in business, but underwriters had themselves realized that bad news or heavy losses could easily have the result of forcing up rates to levels that might be prohibitive for commerce. The Government office was intended to exercise a steady influence. It was vital that essential goods should continue to be shipped, and, if the risks were greater than insurance companies or private underwriters could bear, it was for the nation to assume them. The first rate quoted by the Government was £5 5s. %. On Aug. 8 the rate was reduced to £4 4s., on Aug. 18 to £3 3s., and on Sept. 2 to £2 2s.

All the time underwriters in the market continued to write war risks. Their rates of premium were frequently below those of the Government, and there were many risks which the Government office would not accept. For instance, the Government office would not accept lines after a ship had left port. Merchants sometimes found that larger quantities of goods had been shipped than they had anticipated, or that the values were greater. Then insurances were effected in the open market. As Germany was no respecter of the rights of neutrals, insurances were also placed in the market on behalf of steamship owners abroad. Some underwriters of insurance companies and at Lloyd's wrote war risks freely from the outset. They took big risks and made large sums of money. The premium incomes of the insurance companies writing war risks were, in some cases, as much as five times the pre-war standard. This was due not only to the demand for insurance against war perils, but also to the great increase in values of commodities which set in as they became scarce.

The Government office was inaugurated under the auspices of the Board of Trade. The services of a number of leading underwriters were enlisted. On Aug. 5 1914, the office was opened at the Cannon Street hotel and the knowledge that there was a market for the risks undoubtedly had a very reassuring effect. While credit was due to several underwriters who gave their services in the working of this scheme, much of the organization fell upon Mr. W. E. Hargreaves, a leading member of Lloyd's, who worked in close co-operation with the Board of Trade.

There were thus in existence from the very beginning of the war facilities for the insurance of ships and cargoes against all the perils that then had to be faced. There was not the same mobilization of the shipping industry.

Immediately after the declaration of war, freights remained listless. A very few shipowners were able to see that war was coming, and chartered neutral steamers for "time" at the low rates then ruling, and, in the event, found the transactions very profitable. Most shipowners, however, did not foresee the extremely heavy demands which would be made by the Government upon the industry for ships for direct war purposes. Cargo steamers were requisitioned to act as colliers to the fleet and were needed to carry supplies to the armies abroad. It was not until the end of 1914 that freight rates began to move upwards. Just before the outbreak of war the grain rate from Argentina which may be regarded as a representative rate, was 12s. 6d. per ton. By the end of the year this freight had advanced to 50s. per ton. It rose again sharply in the autumn of 1915, and its movements indicated the influence of the introduction of the Excess Profits duty. On Sept. 20 of that year, when Mr. McKenna, the then Chancellor of the Exchequer, introduced the tax, the Argentine grain freight stood at 57s. 6d. per ton. Within a month it had risen to 70s., by Nov. 20 it had advanced to 85s., and by Dec. 20 to 120s. In 1916 the rate advanced further. By Jan. 20 of that year it stood at 140s. and by Feb. 20 at 157s. 6d. The rate further advanced in 1916 to 183s. 6d. Similar increases took place in other shipping trades. These increases were clearly due, in the first place, to the diminution in the supply of shipping available for commerce, which, in turn, was caused by the ever-increasing requirements of the Government, and by the destruction of shipping by the enemy, and also to the incidence of the Excess Profits duty. This tax provided the argument that the nation got the benefit of the increases. The Treasury did, but not the country which had to pay for them in the increased cost of imported commodities. It represented a form of taxation, at

the best, imposed without the authority of Parliament, and the surplus remaining to the owners meant higher profits than, in pre-war years, could ever have been thought possible by them.

For nearly two and a half years the real responsibility for the shipping not requisitioned by the Admiralty rested with the Board of Trade, of which Mr. Walter Runciman was then President. The President of the Board of Trade, with his multitudinous duties of endeavouring to watch over the welfare of all industries, was obviously incapable of giving the close attention to shipping which all the circumstances demanded. The public gradually became keenly interested in the rise that was proceeding in freights and was irritated by it. As its interest developed, it grew into indignation. The matter was raised in Parliament, but the Government of the day showed complacency, regarding the movement apparently as inevitable. It is true that on Christmas Eve, 1915, when freights were still climbing, Mr. Arthur Balfour referred in the House of Commons to the "terrible level" of freights which, he admitted, increased the price, both of the necessities of life to the poor, and of many things which were essential to the Government in the proper conduct of the war. Yet the Government, when it was spurred into action, contented itself with adopting further piecemeal measures.

*Government Measures.*—One successful measure taken at the outset might have formed a model for a broader policy, and, two and a half years later, did so. This was the requisitioning by the Government of the whole of the refrigerated space in the meat-steamer trading between the United Kingdom and Australasia. This transaction was followed, a few weeks afterwards, by the requisitioning of similar space in the steamers trading with S. America. Arrangements were, at the same time, concluded by the Government with the meat companies for a proportion of their weekly production at fixed prices. Thus, not only were there ample supplies secured for the navy and army at reasonable cost, but supplies were available to maintain the civil population.

In the autumn of 1914 owners were asked to keep the Admiralty informed of the movements of their ships. It was a peculiar fact that very little, if any, information was then in the hands of any Government department of the services of the British shipping companies. Such information had to be sought from the companies themselves.

In the summer of 1916 a scheme was instituted, on behalf of the Indian Government, for buying in India, transporting to the United Kingdom and selling there the exportable surplus of the Indian wheat crop and, through the formation of a committee of brokers, the freight rates were kept on a comparatively moderate basis. In the autumn of that year the Imperial Government was forced into further action. A committee was appointed to consider the desirability of particular voyages and a system of licences was introduced. Another committee was formed for the requisitioning of vessels for the transport of foodstuffs, and a third, known as the Port and Transit Executive Committee, was formed to deal with the congestion at the ports of the United Kingdom, which, by then, had become a very serious matter. As from March 1 1916, licenses were required for all ships of over 500 tons gross trading to and from the United Kingdom.

Licences were granted for whole services or particular voyages. The system also enabled discrimination to be exercised between the different ports of the United Kingdom and so it was important in the relief of congestion.

The committee appointed to deal with the requisitioning of ships for foodstuffs followed the policy of directing owners to load their vessels where the need was most urgent and then to leave the owners to accept the full market rates of freight.

The first chairman of the Port and Transit Executive Committee was Lord Inchcape, and the Committee included representatives of the Admiralty, the War Office, shipping, railways and dock authorities. It was subsequently strengthened by the addition of Labour leaders. It owed responsibility, directly, to the Prime Minister and adopted such measures as would tend to relieve congestion at the ports. Its task was a formidable one and, while the Committee was able to bring about certain reforms, it could not entirely remove the troubles. These actually seemed to be

at their worst after the Armistice. Immense supplies of commodities which could not be moved during the war were poured into the country, and the facilities for removing these proved quite inadequate, with the result that ships were detained for long periods, owing to inability to discharge their cargoes. Much public attention was focussed on the waste of shipping thereby involved. Strenuous efforts were made by all concerned to improve the situation. As an indication of what was being done, the Port of London Authority issued a weekly bulletin showing the number of vessels detained, and continued to issue this until the situation was completely changed and, early in 1921, the weekly return showed that large numbers of steamers were laid up idle owing to the lack of employment. Lord Inchcape was succeeded as Chairman of the Committee by Sir Norman Hill, who, on a breakdown of health caused by overwork was, in turn, succeeded at the end of 1919 by Sir John Barran. The Committee was formally dissolved by the Prime Minister early in 1921. During the period of its activity it had wide powers, and, at the outset, had, among other measures, effected a change in the Customs Regulations which, as was proved, were then having the effect of accentuating the difficulties.

The chairman of the Ship Licensing Committee was Mr. (afterwards Sir) Maurice Hill, and it included Mr. (afterwards Sir) F. W. Lewis, then deputy chairman of Messrs. Furness, Withy & Co., as vice-chairman, Mr. H. A. Sanderson (president of the International Mercantile Marine Co. and chairman of the Oceanic Steam Navigation Co.), Mr. Scholefield, of Newcastle, Mr. Purdie, of Glasgow, and Mr. Burton Chadwick, of Liverpool.

The Committee for the requisitioning of ships was presided over by Mr. J. H. Whitley, who in April 1921 became Speaker of the House of Commons. It included three shipowners, namely, Mr. (afterwards Sir) T. Royden, deputy chairman of the Cunard Co., Mr. (afterwards Sir) E. W. Glover, of the shipowning firm of Glover Bros., and Mr. R. D. Holt, the chief of the important shipowning firm of Liverpool. All these members had previously been advising the Transport Department of the Admiralty.

In spite of the measures that were being adopted, freights remained on a very high level, and the shipping situation was very unsatisfactory. The need for complete control was urged persistently in *The Times* newspaper, and in Feb. 1916 the Government was again forced to act. In that month an Allocation Committee, or Shipping Control Committee, was formed in order to apportion the tonnage according to the various and urgent demands that were made upon it. Lord Curzon was appointed chairman of this Committee. Other members were Lord Faringdon, then better known as Sir Alexander Henderson, Mr. Thomas Royden, and Mr. F. W. Lewis.

**Supply of Tonnage.**—It became plainer every day that the ever-reducing supply of tonnage was becoming less adequate to meet all the demands made upon it. Consequently, the Government decided to place restrictions on the importation of various commodities. The first of these to be effected were paper, paper-making materials, tobacco, dried fruits, furniture woods, stones and slates. In March 1916, a prohibition was placed on the importation of many articles under the general heading of "luxuries." Among such articles were motor-cars for private use, musical instruments, cutlery, hardware, cotton and woollen manufactures, chinaware, fancy goods and soap. A restriction was also placed on the importation of certain brewing materials.

The inadequacy of the tonnage to meet the supplies was at that time due more to the requirements of the Government for ships for direct war purposes than to the depredations of the enemy. The highest quarterly loss of British shipping due to the enemy was 356,000 tons in the third quarter of 1915. In 1916 the ratio of loss fell; in the second quarter, the total amounted to 271,000 tons and in the third quarter to 284,000 tons. This drop was, however, only temporary, and in the fourth quarter of 1916 the total sprang up sharply to 617,000 tons and then continued at a high rate until the conclusion of the Armistice.

Throughout 1916 what became known as the "shipping problem" continued to attract great public attention. Articles were published in *The Times* urging the need of centralized control, in

order that the utmost use might be made of the continually declining supply of tonnage and so that ships might be employed in the most effective way, irrespective of the individual trades of the ownerships to which they belonged. It was realized that this could only be brought about when all ships were hired to the Government, so that it would become for the owners a matter of more or less inconsequence into which routes the vessels were put. The principle of standardization was also persistently urged in order that large numbers of vessels might be constructed on identical plans and of parts fabricated from the same models. It was not, however, until the formation of Mr. Lloyd George's Government in Dec. 1916 that the shipping situation was completely taken in hand.

**Ministry of Shipping.**—A feature of the new Government was the creation of a Ministry of Shipping. As Shipping Controller, Sir Joseph Maclay was appointed. Sir Joseph Maclay had been known in shipping circles as a successful manager of cargo steamers and, while he was little known to the general public, the appointment was regarded in the shipping industry as a good one. By his own wish Sir Joseph Maclay was not a member of the House of Commons, but was represented there by Sir Leo Chiozza Money, as parliamentary secretary.

Various measures were soon taken to secure a better grip of the shipping problem. One of the most important of these was a general requisitioning of liners by the Government. These vessels were hired to the Government on the basis of what were known as Blue-book terms—those agreed early in the war with the Admiralty by a committee of owners presided over by Lord Inchcape. The management of such vessels as could be retained in ordinary commerce was left with the owners, who were required to give a financial account of their stewardship to the Government, and to pay over all profits above the Government rates of hire. Under this system it was less important to the individual ownerships into which routes their vessels were put. It was well that control was centralized, for, early in 1917, the enemy submarine war intensified and the losses greatly increased. As compared with a loss of 617,000 tons in the last quarter of 1916, the British tonnagesunk in the first quarter of 1917 amounted to 912,000 tons. The pinnacle was reached in April of that year and for the second quarter of 1917 the losses totalled 1,362,000 tons. Sinkings of foreign vessels were proceeding apace all the time, and in the second quarter of 1917 the total losses for the world amounted to 2,237,000 tons. The losses for each quarter throughout the war period are shown in the following table extracted from a White Paper (C.921) issued at the end of 1918:—

Period	British	Foreign	Total of World
	Gross tons	Gross tons	Gross tons
Aug. and Sept. 1914	341,824	85,947	427,771
4th Quarter	154,728	126,688	281,416
1st Quarter 1915	215,905	104,542	320,447
2nd "	223,676	156,743	380,419
3rd "	356,659	172,822	529,481
4th "	397,139	187,234	494,373
1st Quarter 1916	325,237	198,958	524,195
2nd "	270,690	251,509	522,289
3rd "	284,358	307,681	592,039
4th "	617,563	541,780	1,159,343
1st Quarter 1917	911,840	707,533	1,619,373
2nd "	1,361,870	875,064	2,236,934
3rd "	952,938	541,535	1,494,473
4th "	782,889	489,954	1,272,843
1st Quarter 1918	697,668	445,668	1,143,336
2nd "	630,862	331,145	962,007
3rd "	512,030	403,483	915,513
4th "	83,952	93,582	177,534
Totals	9,031,828	6,021,958	15,053,786

<sup>1</sup> This figure includes 210,653 gross tonnage interned in enemy ports. After Oct. 31 the tonnage lost by enemy action was: British 11,916, Foreign 2,159.

*New Construction.*—Attention was at once given by the Shipping Controller to the need of construction, and a programme for standardized ships was laid down. The principle of standardization had already received practical recognition in June 1916, when the Standard Shipbuilding Co., to operate at Chepstow on the river Wye, was formed. This company received very powerful support, the capital being subscribed by, among other companies, the P. & O. and British India, New Zealand Shipping, Orient Steam Navigation, Federal Steam Navigation, Messrs. Furness, Withy & Co., the Shire Line, Messrs. A. Weir & Co., Messrs. Harris & Dixon, Messrs. Trinder, Anderson & Co., Messrs. Bethell, Gwyn & Co., and Messrs Birt, Potter & Hughes. Mr. James Caird, the head of Messrs. Turnbull, Martin & Co., was appointed chairman, and Mr. John Silley, managing director of R. & H. Green and Silley Weir, an old and famous shipbuilding firm, was appointed vice-chairman. In Aug. of that year this company acquired the engineering firm of Edward Finch & Co., Ltd., which had originally been formed to build Brunel's Bridge over the river Wye. In this yard three building slips were prepared, and at the beginning of 1916 two cargo steamers of 3,300 tons were being built there, in addition to a large number of smaller vessels. The first four slips for building steamers of up to 10,000 tons in the Standard Co.'s new yard were also being prepared. Difficulties had to be overcome in the way of securing sufficient labour and part of the scheme provided for the construction of a garden city. Early in 1917 much progress had been made with the provision of housing accommodation under licences from the Ministry of Munitions.

These yards were subsequently taken over by the Government. A great deal of money was spent upon them. Various difficulties arose, and the results of the work there were very disappointing. After the Armistice the great bulk of the property was sold to private interests.

On assuming office, Sir Joseph Maclay at once tackled the problem of shipbuilding, and appointed a committee to advise him on all matters connected with the acceleration of merchant ships under construction and nearing completion, and the general administration of a new merchant shipbuilding programme. This committee included Mr. (afterwards Sir) George J. Carter (of Messrs. Cammell, Laird & Co., Ltd.), president of the Shipbuilding Employers' Federation, as chairman; Mr. (afterwards Sir) W. S. Abeil, (chief surveyor to Lloyd's Register of Shipping); Mr. (afterwards Sir) F. N. Henderson (of D. & W. Henderson & Co., Ltd.); Mr. James Marr (of J. L. Thompson & Sons, Ltd.); Mr. Summers Hunter (of the North-Eastern Marine Engineering Co., Ltd.); Mr. (afterwards Sir) C. J. O. Sanders (of the Marine Department, Board of Trade); and Mr. (afterwards Sir) W. Rowan Thomson (of Messrs. D. Rowan & Co., Ltd., president of the North-West (Clyde) Engineering Trades' Employers' Association); Mr. A. R. Duncan, secretary to the Shipbuilding Employers' Federation, who, as Sir Andrew Duncan was later appointed Coal Controller, was secretary to the new committee.

The last word in merchant shipbuilding then rested with the Admiralty, on the ground that it was necessary for the naval authorities to determine what proportion of labour and material should be allotted to naval and merchant construction respectively. These proportions were dependent on the view held as to whether it was better to concentrate on the building of destroyers and other craft for the destruction of enemy submarines and for the protection of merchant vessels, or to build merchant ships. There was a great deal to be said for the theory that it was better to prevent ships being sunk than to build vessels to replace those destroyed. In May 1917 Sir Eric Geddes was appointed to the post of Navy Controller, and shortly afterwards, Maj.-Gen. A. S. Collard, director of inland waterways and docks, in the department of the director-general of movements and railways, was appointed deputy controller for auxiliary shipbuilding. The latter term was used to cover all merchant vessels. In July 1917, Sir Edward Carson was succeeded as First Lord of the Admiralty by Sir Eric Geddes, and Mr. (afterwards Sir) Alan Anderson became Navy Controller. The problem of merchant shipbuilding was at this time acute. The British shipping destroyed by the

enemy in 1916 represented 1,498,000 tons, or nearly three times the production in British yards. This had fallen from the very poor total of 650,000 tons in 1915 to 541,000 tons in 1916. The peak in British shipbuilding had been reached in 1913, when 2,280,000 tons gross had been built, consisting of 1,920,000 tons of merchant vessels and 320,000 of warship tonnage calculated on a converted basis. It was to repeat such a production that the authorities at last aimed, the difficulties being enormously increased by the fact that large numbers of skilled men had been withdrawn from the shipbuilding industry for the fighting forces. The military authorities agreed to release such skilled men as could be spared, but as these were scattered over the various theatres of war, their return was very slow.

When responsibility for mercantile shipbuilding was transferred from the Ministry of Shipping to the Admiralty, some little friction arose between the new authorities responsible and the old Advisory Committee to the Shipping Controller, and in the autumn of 1918 a Shipbuilding Council to the Navy Controller was created, consisting of the members of the old Committee and advisers from the Admiralty. The position continued in some respects unsatisfactory, and in the spring of 1918, after an agitation for a more energetic merchant shipbuilding programme, Lord Pirrie was appointed Director-General of Merchant Shipbuilding, the official appointment being announced in the House of Commons on March 20 1918. He was regarded as the outstanding figure in British shipbuilding, and he was able to infuse energy into the shipbuilding programme. One of his first efforts was very greatly to improve the organization for the repair of damaged ships. Many vessels, after being torpedoed, managed to limp into ports, some of which, notably Falmouth, became seriously congested. A system of close and centralized control of the repairing facilities was organized, and much was done to make the damaged ships soon available again for service. The assistance of the United States in merchant construction had been earnestly invited. That country threw itself into the effort with immense fervour, and the height of the shipbuilding campaign was reached there in the summer of 1918. In June 1918, as responsibility for merchant shipbuilding now rested with the Department of the Controller-General, Sir Alan Anderson resigned from the position of Navy Controller. After the Armistice the responsibility for the completion of the merchant shipbuilding programme was transferred again to Sir Joseph Maclay, the Shipping Controller.

Financial results of the shipbuilding programme were described in the House of Commons on March 12 1921, by Col. Leslie Wilson, parliamentary secretary to the Ministry of Shipping. Colonel Wilson stated that the total cost of 228 ships built in the United Kingdom for the Government was £36,481,000, and that the ships were subsequently sold for £47,591,000, showing a total profit of £11,110,000. An agreement was entered into with the Government by Lord Inchcape, who undertook to distribute the ships to those British owners who desired them, in proportion to their losses. The agreement was made on the basis that no profit should accrue to him through the transaction. Outside the United Kingdom there were built for the British Government 122 ships, the vessels being built at much higher prices than those paid for the vessels constructed in the United Kingdom. The total cost of these vessels was £26,884,000, and the selling price was £18,280,000, showing a loss on the ships built abroad of £8,595,000. The net profit on 378 ships built and sold, excluding any allowance for depreciation, was £2,515,000. Colonel Wilson maintained that the Government would have been fully justified in taking depreciation into account, and, allowing 5% depreciation on 311 ships which were being worked, there would have been a net profit not of £2,515,000, but of £5,122,000. Again, but for the new ships it would have been necessary for the Government to try to charter neutral vessels, for which high rates of freight would have had to be paid. This would, it was estimated, have involved an additional expenditure of £27,000,000. There was no question that the Government acted wisely, at any rate from the financial point of view, in disposing of the ships when it did. They were offered to the ship-

ping industry at a time when freights were still high, and so substantial prices were bid. A very different situation existed when the ex-German ships allotted to this country were offered to British shipowners, again through the medium of Lord Inchcape. Severe depression had, by then, fallen on the shipping industry, and the absorption of the ships, many of which were not of attractive type to British owners, was a very slow matter.

Replying to a question in the House of Commons on May 24 1921, Sir Robert Horne, the Chancellor of the Exchequer, stated that 202 ex-enemy ships allotted to the British Empire for final ownership had been sold, and that 85 merchant ships and 22 trawlers remained unsold. The gross amount realized was £14,523,074. From this gross total there fell to be deducted expenses of repair, delivery, etc., and a considerable part of the purchase money was payable in instalments over a period of years. The net cash then passing was £6,500,000.

*War Services of the Mercantile Marine.*—All the classes of British ships which form a great mercantile marine rendered services of immense value to the Allies during the war. Merchant vessels, in comparison with warships, were once described as being mere cockleshells, yet their crews faced the hidden dangers of mine and torpedo without flinching. The persistent reduction of the British mercantile marine which proceeded was a matter of extreme gravity to the Allies. Experience showed that the losses of the large and fast liners were, in every way, more formidable than those of the ordinary cargo vessels. When at last the United Kingdom, enthusiastically supported by the United States, bent energies on the construction of merchant vessels, it was the simple cargo steamers that were built. In both countries the plan of building simple vessels of standard type was adopted. Everything that was complicated was ruled out. Straight lines were substituted for curves, and parts were produced in great numbers, so that identical ships could be built rapidly. In the United States the principle of standard construction was carried further than in England. There, steel works, which had never undertaken shipbuilding work before, produced shapes and angles for ships, and the assembling of the parts was carried out by bridge builders and other steel workers who had had no previous experience of shipbuilding. In England fabrication on somewhat similar lines was planned in connexion with the new shipyards on the river Wye, of which control was assumed by the Government, but these plans did not begin to show their full effect until the conclusion of the war made such methods no longer necessary. While, in a case of emergency, a good case could be established for building cargo vessels in mass production, like Ford motor-cars, there was no similar way of building the large liners. In the height of the crisis and, indeed, throughout the war, the building of such vessels yielded place to the need for carriers of food and munitions. Yet the duties devolving on the liners steadily increased. At first a comparatively small number were requisitioned to serve as merchant cruisers, patrol vessels, hospital ships, and transports. The Dardanelles campaign made heavy demands on this type of vessel, and, later, the Salonika expedition. The climax was reached when, in the spring, summer and autumn of 1918 every possible ship that could be provided was needed to transport American troops. Liners were withdrawn from every British service and vessels never intended for such work were put into the N. Atlantic route. It was indeed fortunate for the nation that a large mercantile marine was in existence at the outbreak of war, and the magnificent services of some of the greatest ships will be always remembered.

Of all the crimes committed by Germany at sea, the destruction of the "Lusitania" on May 7 1915 remains the outstanding example. The liner was torpedoed near the Old Head of Kinsale, when 1,195 persons were drowned, including 291 women and 9 children. Represented in tonnage alone this loss was exceeded by the "Britannic," sunk in the Aegean Sea on Nov. 21 1916, by submarine or mine, while employed as a hospital ship. The "Britannic," uncompleted on the outbreak of war, was of 48,158 tons and was the largest White Star liner. The "Lusitania," built in 1907, was of 31,550 tons.

Splendid service was performed by the sister ship "Maure-

tania." At first she was employed in the ordinary trans-Atlantic service, where her speed was of great importance in view of possible attacks by German cruisers. In June 1915 she flew the White Ensign, conveying troops to Mudros for the Gallipoli campaign. Four months later she became a hospital ship. In Dec. 1916 she again became a troopship and brought Canadian troops to this country. Early in 1918 she became an armed cruiser, but was soon engaged in bringing American troops to Europe. She also carried many distinguished passengers whose urgent duties made it necessary for them to cross the Atlantic. Fine service was also rendered by the Cunard liner "Aquitania," of 45,600 tons. Only three round voyages between Liverpool and New York had been made by this great ship before the war. At once she was requisitioned by the Admiralty and was commissioned as a merchant cruiser, leaving Liverpool in this capacity four days after the outbreak of war. She became a transport later and carried 30,000 troops to the Dardanelles; then she became a hospital ship and as such carried 25,000 men. Early in 1918 she was re-fitted as a transport, and in nine voyages carried 60,000 American troops. The liner was extremely useful in repatriating troops after the Armistice, and in the spring of 1921, in the middle of the shipping depression, had the reputation of being the only ship afloat that was earning any money. Besides carrying large numbers of saloon passengers, she was eminently fitted for the transport of emigrants, of whom she carried enormous numbers from the Continent.

The "Carmania," well known as a Cunard liner before the war, distinguished herself by sinking the German merchant cruiser "Cap Trafalgar" in a duel. The "Laconia," another Cunard liner, shared in the operations in the Rufiji river, East Africa, when the German cruiser "Königsberg" was sunk. Besides the "Lusitania," the Cunard Co. lost the following vessels:—the "Caria," "Veria" (1915), "Franconia," "Alaunia" (1916), "Ivernina," "Lycia," "Folia," "Trachia," "Feltria," "Ultonia," "Volodia," "Vinovia" (1917), "Andania," "Valeria," "Aurania," "Ansonia," "Vandalia," "Carpathia," "Flavia" and "Ascania" (1918). These represented extremely serious losses, and after the Armistice the company put in hand an extensive programme of construction. Unfortunately the cost of building was then on a very high level.

Losses of the White Star Line were also serious and included, besides the "Britannic," the "Oceanic," "Arabic," "Laurentic," "Cymric," "Afric," "Georgic," "Cedric" and "Delphic." Shortly after the outbreak of war, the "Oceanic," "Teutonic," "Cedric," "Celtic" and "Laurentic" were commissioned as armed cruisers. The "Laurentic" was sunk by submarine off the coast of Ireland in Jan. 1917, while carrying gold, of which a substantial proportion was recovered in salvage operations after the Armistice. The "Teutonic," built in 1889, and one of the most famous of the White Star liners, was subsequently acquired by the Government and was later publicly offered for sale. Services of immense value were rendered by the "Olympic" of 46,439 tons. She was employed in carrying troops to Gallipoli and in bringing, first, Canadian troops, then Chinese labour battalions, and, finally, American troops to Europe. Her war record included that of transporting more than 200,000 persons during the period, including the wives and families of Canadian soldiers returning to Canada after the war. Among her special services were the rescue of the company of the super-dreadnought battleship "Audacious," sunk by a mine off the N. coast of Ireland, and the ramming of a large German submarine in the English Channel in May 1918.

Several of the ships of the allied company, the Atlantic Transport Co., were employed in the transport of troops. These included the liners "Minneapolis," "Minnesota," "Minnewaska," "Minnetonka," "Marquette," "Manitou," "Menominee," "Missouri" and "Maryland." Besides carrying troops, the vessels of the Atlantic Transport Co. carried large numbers of horses and mules, for which service the vessels were especially suitable. The losses of the line, representing 24,100 tons, or 43% of the fleet, included all the regular passenger liners which were most favourably known in the trade between London and New York.

Liners of the Canadian Pacific Ocean Services were employed as merchant cruisers and transports. At once the "Alsatian," "Victorian" and "Virginian" were requisitioned and placed in the 10th Cruiser Squadron which was responsible for a share of the blockade of Germany. The "Calgarian" was sunk on March 1 1918 when proceeding in charge of a convoy of 30 ships.

The total number of vessels lost by the P. & O. Co. and its allied lines was 81, representing 491,600 tons, while 14 vessels of 76,600 tons were lost through marine causes. One of the most heroic actions of war at sea was fought between the "Otaki" of the associated New Zealand Shipping Co. (whose commander, Lt. Archibald Bisset Smith, received a posthumous award of the V.C.) and the disguised heavily armed German cruiser "Moewe." After the "Otaki" had suffered several casualties and much damage had been done to the hull which was heavily on fire, Lt. Smith ordered the boats to be launched in order that the crew might be rescued. He remained on the ship and went down with her when the vessel sank with colours flying.

The Orient Co.'s liners "Otranto," "Orama" and "Otway" were early commissioned as armed cruisers and, at the beginning of 1915, the "Orviotto" and "Ophir" were likewise commissioned. Subsequently the "Ophir" was bought by the Government. Other vessels of the line were employed as transports. The "Otranto" was lost by collision on Oct. 6 1918.

Heavy losses were suffered by the various companies controlled by Sir John Ellerman. In all, 103 ocean vessels, with a total cargo capacity of 600,000 to 750,000 tons, were destroyed. These included the liner "City of Athens" mined off Cape Town in Aug. 1917. The "City of Winchester" was the first merchant vessel to be destroyed during the war, being captured by the German cruiser "Königsberg," while homeward bound from India with a very valuable cargo of produce. Another liner belonging to the Ellerman fleets was mined far from Europe. The "City of Exeter," a fine passenger ship, struck a mine in the Indian Ocean, about 400 m. from Bombay. Number 1 hold filled at once, and the master gave orders for the passengers and crew to leave the ship. Then the master and chief engineer returned and, at grave risk, made a thorough examination of the ship. They decided that, with the exercise of the greatest care, the crippled vessel could reach Bombay under her own steam. The passengers reembarked and the vessel safely arrived in port. This was only one example of fine seamanship, of which there were many hundreds of magnificent cases during the war. When the enemy's submarine campaign became intensified not a voyage through infested waters could have been completed without the exercise of courage of the highest order, and repeatedly the seamanship and endurance of the officers and crews were put to the severest test. There were lurking dangers for the ancient little collier which had to feel her way up and down the North Sea, her one protection being a little gun—slight armament against a powerfully armed submarine; for the great liners which proceeded without escort and relied on their speed, their own guns, their "dazzle painting," and their zig-zag courses to baffle the efforts of the enemy to sink them with, perhaps, several thousand troops on board; and for the slower cargo vessels which, in convoy formation, when thick weather obscured the other ships, ran the very serious risk of collision.

Vessels of the Royal Mail Steam Packet Co. had the distinction of being the first among the British liners to be fitted before the war for carrying a gun for defensive purposes. This was in accordance with the policy initiated, before the war, by Mr. Winston Churchill when First Lord of the Admiralty. Royal Mail vessels were largely employed as armed cruisers, transports and hospital ships. As armed cruisers there were commissioned the "Andes," "Arlanza," "Almanzora," "Avon," ("Avoca"), "Ebro" and "Alcantara." The last named, only lightly armed, fought the disguised German raider "Greif" for 20 minutes in the North Sea, and sank with colours flying just before her enemy went to the bottom. The "Asturias" was torpedoed while bearing all the marks of a hospital ship. Other ships of the line which bore the Red Cross were the "Araguaya," "Drina," "Essequibo," "Tagus," "Agadir," "Berbice" and "Balantia"

(renamed "St. Margaret of Scotland"). Many vessels of the fleets were sunk, including the large liners "Amazon," "Drina," and "Merionethshire."

No fewer than six of the Union-Castle liners were torpedoed or mined while serving as hospital ships, namely, the "Galeka," "Braemar Castle," "Dover Castle," "Glenart Castle" (twice), "Gloucester Castle," and "Llandovery Castle." While based on Southampton the hospital ships of the company carried 331,000 British wounded officers and men to port and also landed 8,200 enemy wounded. The liners "Armada Castle," "Edinburgh Castle," "Kinfauns Castle," and "Kildonan Castle" were commissioned as armed merchant cruisers. The company's vessels also carried very large numbers of troops. It was not surprising that, after the Armistice, many months elapsed before a sufficient number of vessels could be again placed in the ordinary S. African passenger service to provide weekly sailings.

Recognition of the services of British shipping during the war was made by the King and his ministers in various speeches. Speaking at the Guildhall on July 29 1919, the King declared that the splendid services of the officers and men of the British mercantile marine had been vital to the successful issue of the war. From day to day these men had been facing death no less than the soldiers in the fighting line, and, even when the submarine menace was at its height, no single British crew ever refused to sail. He urged the re-creation of the merchant navy and the development of the ports as essential if the United Kingdom was to regain its old supremacy.

Men of the mercantile marine marched in the procession of the Allied and Associated Forces through the streets of London on July 19, 1919. There was also a special pageant of the Sea Services on Aug. Bank Holiday 1919. This took the form of a procession of lifeboats, bearing the House flags of all the shipping companies, from the Pool of London to Chelsea. The procession was headed by a launch flying the flag of the Port of London Authority, followed by a steam vessel of Trinity House, with the Duke of Connaught, as Master, on board. Then came a picket boat with a naval officer in charge as escort to the Royal barge. In this were the King and Queen, Queen Alexandra, the Prince of Wales, Prince Albert (afterwards Duke of York) and other members of the Royal Family. Following this was a specially prepared barge bearing the Lords of the Admiralty and then the Lord Mayor, as admiral of the Port of London, in the barge of the commander-in-chief at the Nore. These were followed by members of the Ministry of Shipping, the Customs and Excise, Lloyd's and the Thames Conservancy. A dozen twelve-oared naval cutters, four picket boats and an armed motor-launch of the navy, models of naval guns, motor and steam lifeboats, a motor-launch carrying Trinity House pilots, steam-boats of the Mercantile Marine Association and boats from the training ships, fishermen's motor drifters, and vessels representing the Missions to Seamen. The rear was brought up by 70 lifeboats towed by tugs bearing the flags of the various shipping ownerships. Bands were placed along the line of route and famous old sea songs were sung. Such a commemoration was unprecedented, but then the services of the mercantile marine during the war were likewise unique.

*The Commonwealth Government Line.*—In the summer of 1916 a development occurred of great importance to shipping. For some time Australia had been seriously disturbed about the difficulties encountered in arranging for her exportable surplus of wheat, a matter of vital importance to the Commonwealth. With the ever-diminishing supply of tonnage, British vessels had naturally been directed more and more into the N. Atlantic, since it was obviously much quicker to bring wheat to the United Kingdom—less than 3,000 m. across the ocean—than more than 12,000 miles. Mr. W. M. Hughes, the Prime Minister of Australia, arrived in the United Kingdom in March 1916, but he got little satisfaction from the Imperial authorities on the shipping question. He sailed for home in June and, when he was on the water, the announcement was made that he had bought, on account of the Commonwealth Government, 15 second-hand

cargo vessels. The steamers had an average dead-weight carrying capacity of between 7,000 and 8,000 tons, and 10 of them were taken from Messrs. Burrell's Strath line. For the larger vessels the price worked out at about £19 a ton. This was, perhaps, from four to five times greater than the pre-war price, but as events occurred, the purchase proved a profitable one, financially, for Australia. One effect was that the vessels were removed from the United Kingdom Register and were no longer subject to excess profit taxation. This action of Mr. Hughes hardly commended itself to any of the shipping authorities in the United Kingdom, but he had shown unmistakably that full recognition had to be given to the Australian viewpoint. In the autumn of that year the President of the Board of Trade announced that a large purchase had been made of Australian wheat on behalf of the Imperial Government, and that a number of steamers had been requisitioned to proceed to load the wheat in Australia. As the supply of available shipping became steadily less, it proved impracticable to transport all the wheat bought, and immense quantities were stored in Australia until after the conclusion of the war.

The purchase of the 15 cargo vessels represented the foundation of a Commonwealth Government line. Being free from taxation and with freights ruling high, large profits were earned, which made the venture temporarily, at any rate, profitable to the Australian people. A number of German steamers seized in Australia were added to the fleet and, later, ships were built both in Australia and the United Kingdom. In 1919 Mr. W. M. Hughes, on a visit to the United Kingdom, placed contracts for five large steamers with leading builders. These were designed for carrying a large amount of refrigerated cargo, and some hundreds of third-class passengers. Limited accommodation was to be provided for a few passengers in the saloon. The first of these steamers, the "Moreton Bay," of 14,500 tons gross, was launched from Messrs. Vickers's shipyard at Barrow on April 23 1921. It was then asserted that the four other vessels would be in the water during the ensuing few months, and that all the vessels would be in service before the end of 1921. Between the time of the placing of the contracts in 1919 and the time of launching, the cost of ship construction had risen very seriously. All work was done on the "time and lime" principle, by which the owners paid for the cost of materials, the cost of labour, an allowance for overhead charges, and a sum, either as a fixed amount or as a percentage on the outlay, as profit to the builders. The ships were thus understood to have cost considerably more than had been expected, and with freights falling, the problem of making the vessels pay their way was enhanced. A wooden ship programme carried out for Australia in the United States was hardly successful financially. The building of wooden vessels, of which large numbers were constructed for the American mercantile marine, could only be regarded as an emergency measure. The inauguration of the Commonwealth line aroused much criticism from shipping managers, who cordially disliked the idea of a State enterprise. They maintained, and could do so justifiably, that a State enterprise could be carried on without the same consideration for profit and loss as a public company, if, for instance, a Government chose to carry merchandise at below cost price.

**The Canadian Merchant Marine.**—Canada instituted a line of Government steamers. It found itself after the Armistice with a great fleet of vessels which had been built in the period of emergency. Instead of offering them to the shipping industry, it decided to operate them on account of the nation. A corporation was formed, entitled the Canadian Government Merchant Marine, Ltd., in close conjunction with the Canadian National railways. The policy of the management was to institute new services and to work in coöperation with the existing lines, rather than to compete with them. New services were established to and from the United Kingdom and many parts of the world. In 1920 an agreement was entered into with Messrs. Alfred Holt & Co. for a joint trans-Pacific service to and from Vancouver, and with the British India Co. for a service between Montreal and Indian ports, via the Suez Canal. In the United

Kingdom the Cunard Co. acted as managers for the line. The usual practice in making these arrangements with the shipping companies was for the Canadian National railways to represent the steamship companies in Canada, and for the agents of the shipping companies abroad to act similarly for the railways. This policy of working in conjunction with the shipping companies disarmed criticism, which was very strong in the case of the Australian scheme.

**Amalgamation and Fusion Schemes.**—Numerous amalgamations and fusion schemes took place between 1910 and 1921. Sir Owen Philipps, who at the beginning of 1910 was chairman of the Royal Mail Steam Packet Co., was particularly active in the policy of fusion. In that year the capital was acquired of the Pacific Steam Navigation Co., which was mainly interested in the trade with the E. and W. coasts of S. America. In the same year a fusion agreement was entered into with Elder, Dempster & Co., Ltd., which owed its development largely to the genius of the late Sir Alfred Jones. In 1911, the capital was acquired of Lamport & Holt, Ltd., largely concerned in the trade between the United Kingdom and also the United States and S. America, and in the same year an agreement was entered into with the Glen Line, Ltd., which is concerned in Far Eastern trade. Incidentally, the Glen Line is notable among British ownerships for its policy of building motor-ships, which is known to have been very successful. In 1912 the capital of the Union-Castle Co. was acquired by the Royal Mail Co. and the Elder Dempster Co. This, perhaps, was the most important of the fusion agreements which Sir Owen Philipps effected. The Union-Castle Co., a consolidation of the old Union and Castle companies in the S. African trade, had been feeling the loss of a great chief in the death of Sir Donald Currie, to whose extraordinary powers the line owed very much. In 1913 control was secured of the Nelson Lines, Ltd., which was and is engaged in the carriage of meat to the United Kingdom from Argentina, together with participation in the passenger trade. In 1917 an interest was acquired in MacAndrews & Co., Ltd., concerned in trade with the Peninsula; in the Coast Lines, Ltd., a consolidation of coasting companies trading round the United Kingdom; and in the Moss Line, Ltd. In 1919 an interest was secured in the old-established ownership of David MacIver & Co., Ltd., in Messrs. Bullard, King & Co., Ltd., and in Messrs. J. & P. Hutchinson, Ltd. While Sir Owen Philipps thus had enormous interests in British shipping, Lord Inchcape was also to the forefront in effecting fusion schemes.

At the end of 1914, Sir Thomas Sutherland retired from the positions of chairman and managing director of the P. & O. Company. For 42 years he had occupied the office of managing director and for 34 years that of chairman. The expansion of the P. & O. Co. will always be associated with his name. His last important act was to effect an amalgamation with the British India Co., of which Lord Inchcape was managing director. On the retirement of Sir Thomas Sutherland, Lord Inchcape became chairman and managing director of the P. & O. Company.

In June 1916, the P. & O. Co. acquired an interest in the New Zealand Shipping Co., which, in turn, controlled the Federal Line trading with Australia. Exactly a year later, in June 1917, a representative interest was secured in the Union Steamship Co. of New Zealand, which not only provided various coasting services in New Zealand, but also maintained services with Australia, British Columbia, and India. In the autumn of 1917 shares were secured in the Hain & Mercantile Steamship Co., and also in the Nourse Line, each of which possessed a considerable amount of cargo tonnage. The fleets of these three companies, together, included 107 steamers of 379,000 tons gross.

Other notable fusions of the war period included the acquisition of a controlling interest in the Prince Line, Ltd., which had been associated with the name of its founder Mr. James Knott. This acquisition, which was effected in Aug. 1916, involved the addition of 37 steamers, mainly cargo vessels, to those controlled by Messrs. Furness, Withy.

In Oct. 1916, Sir John Ellerman, chief of the Ellerman Lines, acquired all the shares of Messrs. Thomas Wilson, Sons & Co., Ltd., the Wilson fleet including nearly 80 vessels of about 200,000 tons. Its services were based on Hull. At almost the same time an agreement was concluded between the Anchor Line (Henderson Bros., Ltd.) and the Donaldson Line, Ltd., for a fusion, under the title of the Anchor-Donaldson Line, with Sir Alfred Booth, chairman of the Cunard Co., as chief of the new formation. The agreement meant that the Cunard Co. secured control of the Donaldson Line, for it already had a controlling interest in the Anchor Line.

**Shipowners' Associations.**—Important work was done by the Liverpool Steamship Owners' Association, especially through the war period. It acted on the principles upon which it was founded in 1848. These were, broadly, that the growth and prosperity of the British mercantile marine is dependent on the enterprise, skill and ability of the individuals directly concerned, and that neither State control nor State aid can prove an effective substitute for these qualities. The Association has not sought to interfere with the individual freedom of its members. It has, however, consistently opposed

all measures calculated either to transfer the control of the country's shipping to official hands, or to hamper its development by rigid rules and standards. It has recognized that the first duty of the shipowner is to secure the safety of the lives and property entrusted to his care, but it has maintained that the individual shipowner, as long as he is discharging that duty, is entitled to carry on his business in the manner which will attain the best results.

The Association had much to do, particularly through the work of its secretary, Sir Norman Hill, with the establishment of the War Risks Insurance Scheme. Throughout the war period it consistently worked with the object of getting the maximum number of voyages made and the maximum number of cargoes carried. It cooperated with the Government authorities when control of shipping was obviously necessary, and when the great emergency had passed, it pressed for freedom for the shipping industry.

A marked development has taken place in recent years in the organization of London shipowners through an extension of the activities of the Chamber of Shipping of the United Kingdom. Rather curiously, the formation of the Chamber in Feb. 1878, was distinguished by the appointment of a Hull shipowner as president. This member was Mr. Henry John Atkinson. The Chamber was composed of local shipowning associations in various ports and of the Protection and Indemnity Clubs, with a central office in London. Its primary objects were to discuss questions affecting shipping; to disseminate information, from time to time, on matters concerning the industry, and to secure the advantages of united action, especially in communications with the Government and various bodies. The Chamber did useful work for many years under its original constitution, but the events of the war showed the need for a more effective organization that would include all classes of shipping. Largely due to the enterprise of Sir Kenneth Anderson, the president of the Chamber in 1915, the reconstruction of the Chamber was carried out. Sir Kenneth Anderson was succeeded as chairman in 1916 by Sir William Raeburn, who held the office for three years assisted by Mr. J. Herbert Scrutton as vice-president. During the years 1916-7 new life was put into the Chamber, and much was done to keep the public informed on matters affecting the shipping industry. Until the reconstruction, the Chamber was fairly representative of the ordinary cargo steamship owners, but the great passenger and cargo steamship companies had not actively been identified with its work. For a number of years highly important steamship companies joined the Chamber, including the Peninsular and Oriental Steam Navigation Co., the Royal Mail Steam Packet Co., and the Union-Castle Mail Steamship Company. The finances were put on a sound basis, enabling the necessary cost of maintaining the work to be secured on the plan of a levy on the tonnage. New offices were taken, and Mr. H. M. Cleminson, a leading shipping lawyer and member of the firm of Messrs. Botterell & Roche, was appointed general manager. Sir William Raeburn, who was elected president in 1916, held office for two years and was succeeded as president by Lord Inchcape in 1918, who also held the position for two years. In 1920 Mr. W. J. Noble was elected president. He was succeeded by Sir Owen Philipps in 1921, with Sir Frederick Lewis as vice-president.

The constituents of the Chamber at the beginning of 1921 consisted of 19 local and special associations, such as those at Belfast, Swansea, on the N.E. coast and Glasgow; 11 Protection and Indemnity Clubs, 7 Freight, Demurrage and Defence Clubs and shipowners entering their tonnage direct, of which early in 1921 there was 5,430,800 tons. The aggregate amount of tonnage entered under the heading of Protection and Indemnity Clubs represented 6,364,300 tons. Membership of these clubs is open to any shipowner possessing a seaworthy vessel who wishes to cover himself against third-party risks. Only British owners are eligible for membership of the Chamber. Until 1919 the Chamber was not incorporated, but in that year it obtained the grant of a Royal Charter. The business of the Chamber is conducted by a council of shipowners who are nominated by the various constituents. Incorporated in the Chamber is the Documentary Committee, which examines and approves forms of charter between shipowners and merchants.

**Statistics.**—In the 1919-20 edition of Lloyd's Register of Shipping, the figures for the mercantile marines of the principal maritime countries before and after the war were set out. These figures were so important and authoritative that they are given in the table following. Outstanding facts were the decrease of 2,547,000 tons in the shipping owned by the United Kingdom, the gain of 7,746,000 tons to the seagoing merchant marine of the United States, the loss of 1,883,000 tons by Germany, and the gain of 617,000 tons to Japan.

In this edition the Register went further than setting out the actual figures of gains and losses. It attempted to estimate the position of the world's tonnage as it would have been if there had been no war. There were obvious difficulties in the way of arriving at a definite conclusion in the case of various countries, for many factors had to be taken into account, but a careful estimate was prepared on the following assumptions. These were: (1) it was reasonable to expect that the percentage of addition to the world's tonnage would have continued at the ratio (a decreasing one) recorded during the previous 15 pre-war years, and that the percentage of the United Kingdom tonnage to the world's tonnage would show, approximately, the same ratio of decrease recorded during the most recent of these years; (2) countries in which there had been a large addition of

*Steam Tonnage of Principal Countries, 1914, 1919.*

Total abroad	26,512	31,552	+5,040	+19.0

tonnage during the previous quinquennial period might be expected to show a reduction in the ratio of increase, and, as a rule, the larger the previous increase the larger would such reduction be; (3) allowances were made in the special cases of countries where pre-war conditions pointed to the acquisition of tonnage, in the near future, at a higher ratio than that recorded during the previous period.

The net result of the calculations made was to show that the British mercantile marine had suffered a loss of 5,202,000 tons, and foreign mercantile marines, with the exception of the United States of America, a loss of 9,000,000 tons, making a total loss to the world of 14,202,000 tons. As a partial set-off to these losses, the United States gained 6,729,000 tons, so that the net world's loss expressed in gross tonnage, was 7,473,000 tons. Germany's loss was set out at 3,582,000 tons, but it was explained that her losses were actually greater, since vessels which at the date of the Armistice had not been captured or requisitioned by other countries were included in her mercantile marine. Excluding enemy countries, the greatest sufferers after the United Kingdom were Norway, whose losses were estimated at 1,025,000 tons; Italy, which suffered a diminution of 677,000 tons; and France with an estimated loss of 536,000 tons.

In these calculations the question of the comparative efficiencies of the pre-war and post-war merchant fleets was not taken into account. The Register pointed out that, apart from additions to the merchant fleets of the world before the war, replacements of steam tonnage lost, broken up, etc., amounted each year to about 1½% of the total tonnage owned, while during the war it required new tonnage equivalent to 33% of the steam tonnage owned in 1914 to replace the losses. There is no doubt that a large amount of the tonnage afloat at the end of the war represented shipping which, in ordinary conditions, would have been broken up and replaced by modern and more economical vessels. How this factor affected the statistical position is indicated by the statement that in the three pre-war years 1911-3, nearly 2,000,000 tons of steamers were sold to foreign owners and replaced by better vessels, while during the three years 1916-8 probably less than 100,000 tons of steamers were sold in this way. Further, a large proportion of the shipping built during the war was, undoubtedly, not the equal in general efficiency of that built in the few years immediately preceding. Taking all these considerations into account, the Register estimated that, through the war, the world had lost 8,500,000 tons gross of shipping, representing a dead-weight carrying capacity of 12,500,000 tons.

Within 12 months the position was very much changed. The total tonnage of the world increased from 47,897,000 tons in June 1919 to 53,905,000 tons in June 1920, an increase of 6,008,000 tons. The loss suffered by the United Kingdom as at June 1919 of 2,547,000 tons had been reduced to a decrease of only 781,000 tons. The United States gain of 7,746,000 tons had been increased to one of 10,379,000 tons. Germany's loss had been increased by the surrender of tonnage, from 1,888,000 tons to 4,716,000 tons. Japan further increased her gain of 617,000 tons to 1,288,000 tons. Once more the Register endeavoured to estimate what would have been the position of the world's mercantile marines in 1920 if there had been no war. It found that the loss suffered by the United Kingdom was 2,920,000 tons; that of Germany 6,103,000 tons; and that of other countries a loss of 3,330,000 tons, making a total loss of 12,353,000 tons. As against this loss, the United States gained 8,837,000 tons, thus reducing the world's net loss to 3,516,000 tons. This estimate again did not take into account the question of the comparative efficiencies of the mercantile marines before and after the war. While such calculations are of great interest, the fact remains that, as the result of the great shipbuilding effort during the war, the world's shipping was greater in June 1920 by 9,282,000 tons. This figure was increased further during the year. The president of the Chamber of Shipping of the United Kingdom stated at the annual meeting held on Feb. 25

1921, that the world's merchant shipping since 1914 had been actually increased by more than 10,000,000 tons. Unfortunately for the shipping industry, the world's trade had not developed in proportion. Owing to the complete breakdown of credit in some countries trade was practically at a standstill.

An unprecedented step was taken by the Register in April 1921, when issuing its shipbuilding returns for the first quarter of the year. It issued with these returns a statement to the effect that, as the times were not normal, the figures of tonnage reported to be under construction did not provide a true index of the relative position of the shipbuilding industry as compared with, say, 12 months previously.

The total tonnage under construction in the United Kingdom at the end of March 1921 was given as 3,798,500 tons represented by 884 vessels. In ordinary times such an amount of work in hand would have indicated great activity and prosperity in the shipbuilding industry. It compared, for example, with 1,890,800 tons under construction at the end of March 1914, showing an increase of 1,907,700 tons, and with 1,722,100 tons under construction at the end of June 1914, the last quarter completed before the outbreak of the war. But the amount of tonnage stated to be in course of construction at the end of March 1921 included a considerable amount on which work had been suspended, owing to the heavy fall in shipping values consequent on the severe decline in freights and the corresponding decline in the demand for tonnage. The tonnage on which work had been suspended in this way amounted to 497,000 tons. There were also included in the total figures some 350,000 tons, the completion of which had been delayed owing to the cessation of work by ship joiners. To arrive at comparative figures, it was therefore necessary to deduct these two figures, amounting together to 847,000 tons, from the amount of tonnage described as being under construction. The total figures of tonnage on which work was actually proceeding at the end of March 1921 was thereby reduced to 2,951,500 tons, showing an increase of 847,000 tons over March 1914.

There would have been grounds for satisfaction in such an increase if the world's commerce had been active. Unfortunately, enormous numbers of the world's inhabitants were taking no part in international commerce, and, further, there were immense numbers who were not producing goods or working at the same rate as before the war. Consequently the construction of so much tonnage, although the work was proceeding at a slow pace, could not be regarded with unmixed satisfaction. Cancellations of shipbuilding contracts by owners were common, and large sums were paid in order that owners might be relieved of their commitments. The surplus of ordinary cargo steamships was especially large. The losses of mail and passenger liners during the war had not been made good, but the high cost of building tended to prevent replacements.

As compared with the figures for the quarter ended Dec. 1920, there was a reduction in the shipping launched during the first quarter of 1921 of 146,000 tons. The tonnage started during the quarter declined by 113,000 tons, while in the tonnage in preparation, but not actually commenced, there was a fall of 75%, as compared with the figures of the first quarter of 1920. Attention was called by Lloyd's Register both at the end of 1920 and in the beginning of 1921 to the lower rate of construction as compared with pre-war times. In 1913 the average amount of tonnage completed during each quarter was over 23% of the total work in hand at the beginning of the quarter, whereas the figures for 1920 fell below 13%. During the first quarter of 1921 the output fell as low as 8% of that under construction at the beginning of the year.

The total amount of tonnage being built abroad was 3,288,100 tons—not quite so large an amount as the tonnage described as being under construction in the United Kingdom, but actually larger than that on which work was actively proceeding there. The Register pointed out that the returns for foreign countries, unlike those for the United Kingdom, were not subject to any material reduction on account of suspended or delayed work, of which there appeared to be comparatively little in other countries. The shipping being built abroad was less by 183,000 tons than that under construction at the end of 1920. The decline was due to the continued decrease in the United States of America, where the tonnage under construction was less by 27% than that building at the beginning of 1919. Apart from the United States, the countries in which the largest amount of shipbuilding was taking place were France, with 427,100 tons, an increase for the quarter of about 30,000 tons; Holland with 417,600 tons; Italy with 351,600 tons; and Japan with 294,300 tons, an increase of 46,000 tons.

The returns showed that there were then 187 steamers and motorships, each of over 1,000 tons, with a total of 1,320,100 tons, under construction for the carriage of oil in bulk. Of the total number, 84, of 557,000 tons, were under construction in the United Kingdom, and 82, of 632,000 tons, in the United States. In the former the oil-tank tonnage represented 57% of the total amount of construction. The tonnage of vessels under construction to be fitted with internal combustion engines amounted to 503,800 tons.

A highly unsatisfactory feature was the diversion of a large amount of British shipping from British to foreign shipyards for reconditioning. This was due to a refusal on the part of the ship joiners to accept the lower wages proposed by the employers and the consequent cessation of work by the ship joiners in the United Kingdom for many months. Large liners were diverted to Dutch and French ship re-

pairing works. The work of reconditioning was essential, and the stoppage by the ship joiners meant the loss of a large amount of work to the United Kingdom, which, it was to be feared, might have a far-reaching effect on the British industry.

*Condition and Prospects.*—What might be described as a bird's-eye view of the state of the shipping industry during 1910-21 is afforded by the course of prices of a new, ready, 7,500-ton cargo steamer "as recorded in the chart published by the weekly shipping journal *Fairplay* and described as "Fairplay's Curve." This type of vessel may be considered representative of ordinary cargo steamers. In 1910 the price of such a vessel was £37,000. Prices then rose sharply and by the end of 1911 a price of £47,000 was reached. A further rise took place in 1912 to £58,000. That year, as has been shown, was a prosperous one for shipping, and from the high point reached, values fell to £48,000 at the end of 1913. A further drop occurred in 1914 to £43,000. The great rise then began. By the end of 1914 the price had advanced to £60,000. In 1915 prices more than doubled and £125,000 was reached. In 1916 there was a further advance to £188,000. The effect of the Excess Profits duty was seen in 1917 and values fell to £165,000. In 1918 there was a recovery to £181,000 and then a fall to £169,000. An extraordinary rise took place in 1919, the high price of £232,000 being reached. Early in 1920 there was a further upward movement. Then a great and steady fall began and by the end of the year the value of £105,000 had been reached. In the first six months of 1920, values again receded. On May 24 two new, ready steamers of 9,250 tons dead-weight built by the Furness Shipbuilding Co. to Lloyd's highest class were sold for £85,000 each, representing rather more than £9 a ton. These ships were of the shelter-deck type, with the tonnage openings closed. Vessels of similar size with tonnage openings carry only 8,300 tons dead-weight, and on that basis the prices bid for the two ships appear somewhat better. Another ship which was of 5,500 tons dead-weight and was built by Charles Hill & Sons, Ltd., of Bristol, was sold for £40,000, representing only rather more than £7 a ton. This particular ship had not been launched, and was not expected to be ready for sea for at least two months.

The Chamber of Shipping estimated that at the beginning of 1921 there were laid up in the United Kingdom, the United States and Scandinavian ports, 5,000,000 tons dead-weight of shipping, or, approximately 3,000,000 gross. This amount of tonnage was made up of 2,250,000 tons in the United Kingdom, represented by 600 vessels, of 2,000,000 tons in the United States represented by 250 vessels, and of 750,000 tons represented by 428 vessels in Scandinavian ports. In addition, many vessels were laid up in Spain, Italy, Japan and other countries, and in the early months of 1921, the amount of tonnage laid up throughout the world steadily increased.

In 1920 there took place the greatest fall in freights that has ever been recorded. The extent of the drop is shown by the movement of the time charter rate, i.e. the monthly rate of hire for ordinary cargo steamers. When vessels are chartered in this way the owners provide and pay the crews and pay for the stores. The charterer pays for the coal, since the amount consumed and the cost depend upon the trade into which the vessel is put. At the beginning of 1920 the usual time charter rate for cargo steamers was 30s. a ton dead-weight. By midsummer the rate had dropped to 20s. a ton or rather less. By the end of the year the rate had fallen to 10s. a ton, and with very little inquiry it fell further. By the end of the first quarter of 1921 steamers were chartered at a rate of 6s. a ton. There were also heavy falls in the voyage rates.

As compared with maximum rates during the war for free British steamers bringing grain from Argentina of about 183s. a ton, the freight early in 1921 had fallen to about 35s. Then, when the coal stoppage occurred at the end of April, rates advanced, owing to the necessity of steamers proceeding from this country in ballast, and to the difficulty of securing bunkers. By the end of May, rates of about 57s. 6d. a ton were being quoted for vessels that were available for immediate loading. It was generally accepted in shipping circles that a freight of about 50s. was necessary to cover the cost of sending a vessel to S. America in ballast and bringing her home with a cargo of grain. The fact that, before the war, cargoes of coal had always been available from the United Kingdom meant competition for the homeward voyage and enabled freights to be restricted. The new conditions were distinctly serious for the shipping industry.

Coal also presented a serious problem for the liner companies. Sir Owen Phillips, chairman of the Royal Mail Steam Packet Co., gave some figures respecting comparative costs at the annual meeting of the company in June 1921. He stated that in 1902 the average cost of all coal consumed by the company's steamers in all ports served, including rail carriage and freight, was exactly 22s. a ton. In 1903, the average price had increased to 22s. 3d., while 10 years later, in 1913, the average cost, including rail and freight, had increased to 22s. 11d., which was then considered a very high average price. In 1920, the average cost per ton of all coal consumed by the company's steamers, including rail and freight, was 120s. 1d. Early in 1921 the price fell very considerably, largely owing to the supply of coal by Germany to France and Belgium, with a consequent falling off in the demand for British coal. Then when the stoppage at the British collieries had been proceeding for some little time, and stocks were being exhausted, British shipping had to look to the Continent for supplies.

The Cunard and White Star companies were in a favourable position as regards the great trans-Atlantic liners, "Aquitania," of 45,600 tons, and "Olympic" of 46,300 tons, since these vessels had been adapted to the use of oil fuel in 1920. Oil fuel, after the war, increased in popularity, although some owners hesitated to commit themselves too much to it, owing to fears that supplies would not be sufficiently abundant, and planned their vessels with a view to the use of either oil or coal. Scandinavian owners, especially, pinned their faith to motor-engines, and it was notable that while coal-burning steamers were laid up idle, motor vessels belonging to the same owners were being profitably employed. There was good reason to believe that an extensive development of the use of motor-engines was to be expected. It was quite certain in 1921 that a strenuous competitive period lay ahead for shipping, and owners had to take into account all possible measures conducive to cheap transport at sea.

(C. MA.)

## (2) UNITED STATES

From the founding of the Federal Government in 1789 onward the United States has possessed a considerable merchant marine. For a hundred years it was the second power in amount of merchant tonnage in the world, surpassed only by the United Kingdom. From the end of the Civil War in 1865 to the outbreak of the World War in 1914, though the American flag was infrequently seen in foreign waters, a great and valuable merchant shipping was in existence, with well-equipped shipyards and a large force of officers and seamen, chiefly employed in home trade on the Great Lakes or on the Atlantic, Gulf and Pacific seaboard with their insular dependencies. The American people at no time in their history have been out of intimate touch with shipbuilding and navigation.

Unlike other nations the United States has steadily maintained an important and increasing waterborne domestic commerce capable of holding its own with formidable railway competition. This coastwise commerce, including the trade with Alaska, Porto Rico and Hawaii, by an unshaken national policy, has been reserved entirely to American vessels, and has had a significant bearing on the development of the American merchant marine. It is interesting to recall that in 1860, the year before the opening of the Civil War, the commercial fleet of the United States was divided almost equally between 2,379,396 gross tons registered for foreign commerce and 2,644,867 tons enrolled or licensed for coastwise carrying. In 1866, the year after the close of the Civil War, the registered foreign trade fleet, as a result of the war, had fallen off to 1,387,756 gross tons—a decrease of almost a million tons—while the coastwise fleet had increased to 3,381,522 tons. This tendency of the foreign trade shipping to decrease, and of the domestic trade fleet to grow, was even more manifest by the year 1910, when the former had fallen to 782,517 gross tons, or actually less than the 981,019 tons which the United States had possessed a century earlier in 1810, while the coastal fleet had increased to 6,668,966 tons, or more than twice as much as the entire American commercial shipping of 1860.

This sharp contrast between the steady decline of the overseas tonnage and the unbroken advance of the domestic tonnage is attributable to the intensity of foreign competition in the one trade and to the absence of it in the other. Through those years the wages of American crews and their subsistence and general style of living imposed a higher cost upon the operation of American ships, and American-built ships in addition bore a substantially higher cost of construction. Moreover, American laws and regulations governing ships have contributed somewhat to this higher expense by their more exacting character. Against this higher expense the coastwise vessels from 1860 onward were absolutely protected by the exclusion of foreign vessels from domestic trade, while the overseas vessels were protected in no way whatever, except for casual postal subsidies to a few regular lines. In view of the fact that from 1860 high protection has been almost continuous in the United States, this exception of the most intensely competitive of industries, ocean shipping, is difficult to understand. The generally accepted explanation is that it has not been possible at any time to present a definite form of national encouragement to the overseas shipping industry which was acceptable to all of the various sections of the country. Subsidies have almost been voted by Congress several times. Discriminating customs duties and tonnage dues, an expedient first adopted in 1789 and maintained in whole or in part for 60 years thereafter, have had a powerful advocacy but, as a matter of fact, have never been made effective because of general commercial treaties which have forbidden them. "Free ships"—that is, the free admission and registry of foreign-built vessels instead of the general prohibition of American registry for foreign-built vessels obtaining since 1789—were adopted

for vessels of less than five years of age in the Panama Canal Act of 1912, but had remained wholly futile up to the war of 1914, which suddenly gave exceptional value to the flag of the greatest neutral.

*Pre-war Position.*—American overseas shipping as distinguished from coastwise shipping reached almost the lowest ebb in 1910, when only 782,517 gross tons were recorded by the Commissioner of Navigation as registered for foreign commerce and sufficed to convey only 8.7% of the total imports and exports of the United States. Though relatively little effort had been bestowed upon the promotion of foreign commerce in these years of wonderful domestic development, the total foreign trade of the United States had increased markedly from a value of \$762,288,550 in 1860 to \$2,982,799,622 in 1910. Whatever the cause of the decline of the overseas American merchant marine, it had certainly not been from any lack of cargoes.

No change or event of consequence marked the years from 1910 to 1914 in the annals of American shipbuilding or navigation. Official records show the amount of shipbuilding, the total registered overseas and the total coastwise tonnage, the total merchant marine and the proportion of American overseas commerce conveyed in American ships, for the five fiscal years ending June 30 1914, to have been as follows:—

Year	Ships Built.	Registered for Foreign Trade	Enrolled or Licensed for Coastwise Trade	Total Merchant Marine	Proportion of Value of Imports & Exports Carried in American Ships
	Gross tons	Gross tons	Gross tons	Gross tons	Per cent
1910	342,068	782,517	6,668,966	7,508,082	8.7
1911	291,162	863,495	6,720,313	7,638,790	8.7
1912	232,669	923,225	6,737,045	7,714,183	9.4
1913	345,155	1,019,165	6,816,980	7,886,518	8.9
1914	316,250	1,066,288	5,818,363	7,928,688	8.6

These records indicate a condition of virtual stagnation in the American merchant marine during the period immediately before the World War. New construction was only slightly in excess year after year of tonnage lost or worn out and abandoned. It was a time of disheartenment among those who desired to see an adequate ocean service under the American flag, and a valuable naval reserve for an emergency.

In the Panama Canal Act of Aug. 24 1912 Section 5 provided that "No tolls shall be levied upon vessels engaged in the coastwise trade of the United States." It was contended before and after the passage of this Act that it contravened the provision of the Hay-Pauncefote treaty, that "The canal shall be free and open . . . to the vessels of commerce and war of all nations . . . on terms of entire equality, so that there shall be no discrimination against any nation or its citizens or subjects in respect to the conditions or charges of traffic or otherwise." President Wilson, who had originally favoured this exemption of American coastwise ships, and had been elected on a platform approving it, unexpectedly early in 1914 advocated the repeal of the exemption provision on the ground that it was in conflict with the treaty, and also that "repeal be granted by Congress in support of the foreign policy of the Administration." After an animated debate in the course of which the President was opposed by several senators of his own party, and at the same time upheld by some eminent Republicans, including Senator Root of New York, repeal was finally accomplished. No actual advantage had accrued to American coastwise vessels from the toll exemption, for the canal had not then been opened to commerce. It was opened Aug. 15 1914, and was utilized in its first year by 1,317 vessels, including merchant carriers, men-of-war and yachts, of an aggregate net Panama Canal tonnage of 4,596,644. Tolls paid amounted to \$5,216,149. In the coast-to-coast fleet of the United States there was soon a notable expansion, and new and important steamers of 10,000 or 12,000 tons dead-weight capacity were plying on the route shortened from 13,000 m. via the Straits of Magellan to 6,000 m. via the Canal. These large coastwise steamers were destined to prove of abundant value to American overseas commerce in the emergency presented by the war.

*War Period.*—When the World War began in Europe Aug. 4 1914 all but 8.6% of the imports and exports of the United States were being conveyed in foreign vessels, chiefly of British and German nationality. The first result was the voluntary "interning" in American harbours of a considerable fleet of

German and Austrian steamers, including the "Vaterland," the largest ship afloat, and other passenger craft of the Hamburg-American and North German Lloyd lines. Another and a much more serious effect upon the carrying of American passengers, mails and cargoes was produced when the British Government, under the increasing stress of the conflict, withdrew month after month from overseas service to and from American ports its own passenger ships and freighters, for the transport service of the gathering British armies and for the auxiliary service of the war fleets. Then the lack of an adequate merchant shipping of its own began to be severely felt throughout the United States.

In the autumn and winter of 1914 agriculture, both North and South, was gravely depressed by the inability to export grain, provisions and cotton, because of the scarcity of ocean ships. Freight rates soon became exorbitant. In Dec. 1914 the freight on cotton from New Orleans to Rotterdam had risen to three or four times its pre-war figure, or to \$2 per hundredweight. Grain in July 1914 had been carried from New York to England for four or five cents a bushel. In Dec. 1914 the cost was 16 to 17 cents, and it still went on advancing. The Democratic party, in power at that time, had as a whole opposed shipping subsidies, but in this crisis the Wilson administration early in 1915 brought forward in Congress a proposal to create a great merchant marine under government ownership and operation. This proposition for what was stigmatized as a dangerous adventure into state socialism was sharply opposed in Congress by conservative Democrats and the great body of Republicans. Meanwhile, the crisis continuing, Great Britain, France and Norway in their acute need of ships to make up for losses by German submarines, began to place contracts for new tonnage in the established and not over-busy shipyards of the Atlantic and Pacific coasts of the United States. In the report for the fiscal year ending June 30 1916 the Commissioner of Navigation noted that of ships building or ordered at that date in American yards "fully 125,000 tons were for foreign shipowners," and that "since July 1 1916 the tonnage ordered in American yards for foreign shipowners exceeded that ordered for American owners." Many of these vessels, it transpired, were being built by funds furnished or guaranteed by the British Government.

So much antagonism had been created by the proposal for a government-owned and operated merchant marine that it was not until Sept. 7 1916 that the Shipping Act desired by President Wilson was passed, and then in a much-amended form with government ownership and operation reduced to a temporary character. Section 3 of this important law provided:—

"That a Board is hereby created, to be known as the United States Shipping Board, and hereinafter referred to as the Board. The Board shall be composed of five Commissioners, to be appointed by the President, by and with the advice and consent of the Senate; said Board shall annually elect one of its members as chairman and one as vice-chairman.

"The first Commissioners appointed shall continue in office for terms of two, three, four, five and six years respectively from the date of their appointment, the term of each to be designated by the President, but their successors shall be appointed for terms of six years, except that any person chosen to fill a vacancy shall be appointed only for the unexpired term of the Commissioner whom he succeeds."

Under the authority of this act the President appointed on Dec. 22 1916 the first Federal Shipping Board, headed by Mr. William Denman, an admiralty lawyer of San Francisco. Not one of the members of the Board had ever operated American-flag ships in ocean commerce. Under the Act the Board was authorized to form a shipping corporation with a capital stock not exceeding \$50,000,000, of which a majority was to be held by the United States for the purchase, construction, equipment, lease, charter and operation of merchant vessels in the commerce of the United States. This became known as the Emergency Fleet Corporation. Its power to operate vessels would cease, under the original Act, five years after the close of the war.

Less than four months after the appointment of the first Shipping Board the United States itself entered the World War, and the powers and resources of the Board were immensely increased by war legislation. Vast sums of money were placed at

the disposal of the Board for the rapid construction of merchant ships on a scale before undreamed-of. Chairman Denman resigned on July 24 1917, and the President nominated in his place Edward N. Hurley, who had been the President of the Illinois Manufacturers' Association, an organization long committed to the development of the merchant marine. A subsequent change made Charles M. Schwab, the steel manufacturer and head of the Bethlehem Shipbuilding Corp., the Director of the Emergency Fleet Corporation. Under the stimulus of Messrs. Hurley and Schwab, the war programme of merchant shipbuilding, which had at first lagged badly, began to take on a new life and vigour. These men had not only directed their vast organization, but aroused the country to respond with all its wealth and power to Mr. Lloyd George's appeal for "Ships, and more ships and yet more ships," to compensate for the havoc wrought by the German submarines. When the United States entered the war in the spring of 1917 there were in the country 37 steel shipyards with 162 ways, and 24 wooden shipyards with 72 ways, capable of launching vessels of 3,500 dead-weight tons. At the signing of the Armistice there were in all 223 shipyards, steel and wood, with a total of 1,099 ways.

There is no parallel in history for this swiftness with which additional shipyards were created. In April 1917, when the United States declared war, every one of the 234 shipways in this country was occupied by a vessel under construction—in part for American owners, in part for foreign owners, the remainder for the navy or other branches of the Government. It was absolutely necessary to create at once the additional facilities required for the building of the 3,115 vessels of a total of 17,276,318 dead-weight tons provided for in the maximum building programme of the Shipping Board. Scores of new shipyards, for steel and wood vessels alike, had to be built. Proper sites were rapidly selected on the Atlantic, the Gulf and the Pacific seaboard, the yards hurriedly laid out, and the requisite tools and machinery installed. This work was pushed with the utmost vigour. Long before the new yards were ready a nation-wide movement had started to recruit an army of shipyard volunteers. It was represented to the workers that they were as truly serving the Allied cause as if they had enlisted in the navy or army. This new crusade was advanced by the State Councils of Defense and by the Department of Labor. Within the first two weeks no fewer than 280,000 workers were enrolled. At the signing of the Armistice 381,000 men were employed in the old and new American shipyards, as against 44,000 when the war began.

American shipyards before 1917 were adequate only for the fairly steady demand of the coast and lake trades and for the requirements of the navy, which, however, were partly filled from Government yards. Only now and then was an overseas steamer constructed. But the coast and lake trades of the United States employ many relatively large and heavy vessels of from 6,000 to 10,000 tons, fit for the 2,000-m. voyages from Portland, Boston, New York and Philadelphia to the Gulf of Mexico, or the 6,000-m. voyages through the Panama Canal between the Atlantic and Pacific seaports. Six or seven yards on the Atlantic and two on the Pacific before the war were capable of building the most powerful dreadnoughts and armoured cruisers. Ocean shipyards, large and small, possessed well-trained and experienced managers and workmen, and there were also many excellent shipyards on the Great Lakes. These efficient staffs were drawn on for the more responsible positions in the new war-born shipyards. The great body of 381,000 workers enlisted were, of course, unfamiliar with ship construction. Most of them had never laboured in a shipyard of any kind. There were thousands from the general building, electrical and other engineering trades, and other thousands from inland farms. It was a composite array, and there was undoubtedly at first much inefficiency and shirking. But the men already trained were set to show the others. Proficiency was rewarded by high wages. The incompetent were gradually weeded out. Appeals to patriotism were effective. Riveting and other work was "speeded up" by offers of prizes, and more and more all hands were made to realize that they were taking an essential part in the winning of the war,

As a result, unheard-of achievements in the way of production speed were soon recorded. The "Tuckahoe," a 5,500 dead-weight ton collier, was completed by the N.Y. Shipbuilding Co. at Camden, N. J., in 37 calendar days; the "Crawl Keys," a 3,500-ton freighter, at the Great Lakes Engineering-Works, Ecorse, Mich., in 34 days. Heavy 8,800-ton freighters were built in Pacific shipyards in from 78 to 88 days, where before the war from six to ten months would have been required. The Bethlehem Shipbuilding Corp. yard at Alameda, Cal., launched the 12,000-ton cargo liner "Invincible" 31 days after the laying of her keel. It was thoroughly realized that such haste would often mar the quality of the work—that ships built in such brief time might well prove less efficient and enduring. But the Government and the builders realized also that it was a race with the German submarines, and that enough ships must be provided by whatever methods at whatever cost to feed and supply the Allies, and to carry and sustain the troops that would soon be crowding over.

One expedient which greatly helped toward quick production was the fabricated ship. One factor in the choice of this plan of construction, never adopted on a large scale before, was the success of the Submarine Boat Corp. in building in 1916 a fleet of 550 submarine-chasers for the British Government. These little vessels were of wood. It was obvious that steel would lend itself more readily to fabrication, and Mr. Henry R. Sutphen, Vice-President of the Submarine Boat Corp., submitted to the Emergency Fleet Corp. a proposal for manufacturing standard steel ships from the same kind of commercial structural steel that is employed for buildings and bridges. This plan was successfully carried out. Structural plates, shapes and other material were prepared at plants all over the country where they could be produced to the best advantage, and shipped to the assembling yards for final riveting together, a certain number of rivets indeed having already been driven before the material arrived. One hundred and fifty fabricated steamers of about 5,000 tons dead-weight were contracted for with the Submarine Boat Corp.'s yard on Newark Bay, N. J. One hundred and eighty fabricated ships of about 7,500 tons were ordered from the great Hog I. Shipyard near Philadelphia. This shipyard, the largest in the world, with 50 ways, was created in less than six months under the direction of the engineers of the American International Corp., out of what had been a waste marsh on the shores of the Delaware River. With its ways, storehouses and workshops it covered 900 acres. Its cost was \$66,000,000. On the completion of its building programme, and when its ships were no longer needed, it afforded an admirable site for a great rail and ship terminal.

Several hundred wooden steamers of a dead-weight capacity of from 3,500 to 5,000 tons were ordered by the Emergency Fleet Corp. in the war emergency. There was much criticism of this project, for the building of wooden steamers for overseas service had long been abandoned in America. Among practical men there never was any delusion that wooden steamers would be of lasting value in peace time service. As Chairman Hurley of the Shipping Board stated: "It was not contended by any responsible authority that wood ships would prove commercially advantageous, that they would be formidable competitors with the ships of the maritime powers in time of peace; but they were regarded, at least as far as the subsequent development of the wood ship programme was concerned, as mere war emergency ships." It should be borne in mind also that when these wooden steamers were contracted for a war lasting for years' was contemplated as possible, and elaborate general preparations were being made to that end. As a matter of fact few wooden steamers were completed in time to carry supplies before the signing of the Armistice, and most of the wooden craft that did get to sea were laid up as soon as possible. Many of them seemed structurally fit, but their cargo capacity was too small to permit of profitable employment. The Emergency Fleet Corp. built more of the relatively small steel ships than could be absorbed by the requirements of normal commerce. Justification for this is to be found in the inexorable needs of war. These small steel steamers of from 3,500 to 5,000 dead-weight tons are of a type

very useful in limited numbers in a near-by trade, like that with the West Indies, for example. Some of them, particularly the oil-burners, are capable of engaging advantageously in trans-oceanic trades. Moreover, no steamers more than 260 feet in length and of about 4,000 tons dead-weight capacity could be brought out into the St. Lawrence River and the Atlantic through the Canadian canals, and it was important in the war months that the Great Lakes shipyards should be utilized.

American commerce, coastwise and overseas, is relatively a trade of rather large cargoes. It is the larger ship, with the lowest crew wage cost per ton, which American shipowners can operate to the best advantage. Nevertheless, these prudential considerations were frankly cast aside by the American Government in the crisis of the war. The authorities deliberately planned and built the kind of a merchant fleet that could be most quickly constructed in the greatest numbers and employed to the best advantage of their Allies.

*After the War.*—On the signing of the Armistice immediate steps were taken by the Shipping Board to reduce its programme of construction. In most cases where a contract could be cancelled at a cost to the Government less than the difference between the cost to complete and the probable market value of the ship at time of completion, cancellation was ordered. By June 30 1920 the building programme of the Shipping Board, which in Oct. 1918 had totalled 3,115 vessels of 17,276,318 dead-weight tons, was reduced to 2,315 vessels of 13,675,711 tons, of which 1,696 vessels of 11,656,961 tons were of steel construction. An important element of the new fleet not cancelled consisted of 23 passenger and cargo steamers of about 13,000 tons each, which were designed as army transports but have been adapted to commercial use. This class of ships, of which the American merchant marine still had too few, is adapted to service across the Atlantic and Pacific and to South America.

Appropriations for the Emergency Fleet Corp. up to the end of the fiscal year 1920 amounted to the immense sum of \$3,255,413,024, of which nearly all was expended for shipbuilding in the war emergency and afterward. Government-built steamers cost on the average \$200 to \$225 per dead-weight ton. Ships of the same type were built in the United States before the war for from \$60 to \$70 per ton, as compared with \$40 to \$60 in the United Kingdom. The record of America's war effort is clearly written in the returns of the Commissioner of Navigation of the total gross tonnage of shipbuilding in the United States in the fiscal years from 1915 to 1920 inclusive:—

Year	Gross Tonnage Built
1915	225,122
1916	325,413
1917	664,479
1918	1,300,868
1919	3,326,621
1920	3,880,639

In 1920 a marked decline in shipbuilding set in as the Government war programme approached completion. On March 1 1921 only 330 steel vessels of a total gross tonnage of 1,434,000 tons were on the ways. More than one-half of this tonnage was of tank oil carriers. Fifty-four of the 330 vessels, representing 435,000 tons, were building on Government account, and 276, of 999,000 tons, for private ownership. This sharp decrease in shipbuilding was then manifest all over the world, and was intensified by the shrinkage of trade and the unprecedented fall of ocean freight rates, which characterized the winter of 1920-1.

*Manning and Operation.*—Far less formidable than the task of creating new shipyards and building 13,000,000 dead-weight tons of ships for the war emergency was the work of officering, manning and operating these vessels. In the existing merchant marine of the United States, in Aug. 1914, there was a trained personnel of about 86,000, only a small part of whom could be spared for the new overseas services which the war demanded. Moreover, many of the trained American officers were required at once in the navy and the naval reserve. Two steps were promptly taken to meet the crisis; the President, by executive order July 3 1917, suspended the provision that watch-officers of vessels of the United States registered for the foreign trade must be American citizens, and the Shipping Board established an extensive sea recruiting and training bureau for the instruc-

tion of both officers and men. Many who had followed the sea in their youth and had left it now returned, and new recruits appeared in great numbers. From June 30 1917 to June 30 1920 this service produced 6,642 licensed officers and 32,335 men, all American citizens. Many others who did not pass through the training service also joined the new ships, and wherever there was need officers and men were ordered from the navy personnel, which had reached a total strength of 500,000. Few ships were anywhere seriously delayed for lack of crews.

For the control of the new Shipping Board tonnage a division of operation was developed. Relatively few of the new vessels were directly operated by the Board itself. Most of them were placed in the hands of the established private companies or new concerns which the war had brought into existence. The vessels were placed on routes indicated by the Shipping Board. Their freight rates were controlled by the Board during and for some months after the war. Division of expenses and profits was difficult to arrange, and was long the cause of much friction between private operators and the Government. Not until 1920 was a fairly satisfactory plan finally devised by which the Shipping Board assumed the risk of the voyage, and a fixed percentage of the gross receipts was allowed to the manager for his services. Government ownership and operation of shipping, especially in the stress of war, proved a difficult undertaking in the United States, as elsewhere. Particularly important was the work of the Ship Control Committee, which directed the movements of shipping to the best advantage. This committee was composed of President P. A. S. Franklin of the International Mercantile Marine Co., President H. H. Raymond of the American Steamship Owners' Association, and Sir Connop Guthrie, representing the British Government.

At the signing of the Armistice, Nov. 11 1918, the Shipping Board controlled a total fleet of 1,196 vessels of 6,540,205 deadweight tons, composed of American, requisitioned, chartered, neutral and seized German tonnage. On Aug. 3 1917 the President, under authority bestowed by an Act of June 15, requisitioned for the national service all steel hulls and materials in American shipyards of vessels of over 2,500 deadweight tons, building either for American or foreign owners, a total of 431 vessels, of 3,056,000 deadweight tons. On Oct. 12 1917, as a further step in Federal control of the shipping situation, another executive order requisitioned all American steel-built power-driven cargo vessels of 2,500 deadweight tons and over, and all American passenger vessels of 2,500 gross tons and over fit for overseas service. This established control over an American fleet of 444 vessels of 2,938,758 deadweight tons. Many of these ships were transferred to their owners for operation. Others were chartered to the war and navy departments. About 600,000 tons of German vessels, seized in American ports when the United States entered the war, were divided among the Shipping Board and the army and navy. In addition the Shipping Board secured the use of a considerable fleet of enemy vessels seized in waters of other countries. To obtain an adequate amount of tonnage the Board also chartered many Allied and neutral ships, a resource which on Sept. 1 1918 amounted to 331 ships of a deadweight tonnage of 1,084,986. By order of March 20 1918, an act which though necessary was deeply regretted at the time, the President caused the navy to seize for the use of the United States 87 Dutch vessels of 533,746 deadweight tons, at that time in or bound to American waters.

A little more than one-half of the two and one-quarter million American soldiers sent to Europe were conveyed in the passenger steamers of Great Britain, France and Italy, chiefly in large vessels of the British lines. Most of the soldiers sent over under the American flag were borne in the former German liners that had had their damaged machinery repaired. After the Armistice, however, most of the American troops were repatriated under the colours of their own country.

**The La Follette Law.**—In the years from 1915 to 1920 inclusive there were several important Federal enactments relative to the merchant marine. One of these was the La Follette Seamen's Law, approved March 4 1915, after a long and bitter controversy in the House and Senate. This law to a large extent governs working conditions on American ships at sea and in harbour. It requires a certain fixed proportion of able seamen and certificated lifeboatmen, a complement of boats and rafts sufficient for all passengers and crew, and improved living spaces and sanitary conditions. Most of the Act in fact deals with life-saving methods and appliances, in accordance with the recommendations of the London Conference on safety of life at sea, following the "Titanic" disaster. Several sections require a more humane discipline than had been frequent in the old days. One section, which has been the cause of much displeasure among the foreign shipping companies, brought about the amendment of treaties requiring the U.S. Government to seize and return to their ships

seamen deserting from foreign vessels in American waters. This, and a complementary section permitting seamen of American or foreign vessels to demand at every port the payment of one-half of the wages due to them, once every five days, is charged with promoting the desertion of foreign crews in American waters and of burdening foreign companies with the cost of hiring substitutes at the American wage rate and with the expense of returning these substitutes to their country. It is insisted by the seamen's unions, however, that these provisions of the law tend to bring foreign ship wages up to American standards.

**Other Legislation.**—By Act of Congress of Aug. 18 1914 the free ship clause of the Panama Canal Act of Aug. 24 1912, which had proved wholly ineffective, was amended by admitting ships more than five years old, and exempting all foreign-built vessels admitted to American registry from compliance with American survey, inspection and measurement laws and regulations. Under this amended law 140 foreign-built vessels of 583,000 gross tons, owned by American citizens or corporations, were admitted to American registry for foreign trade in the fiscal year 1915, when the security afforded by the American flag was valuable. The number of vessels thus admitted fell off, however, to only 26, of 69,697 tons, in the fiscal year 1916, as the higher wages and operating costs of the American flag came to be realized by the owners of foreign-built tonnage. Many of these owners, indeed, sought to change their naturalized ships back to foreign registry, and 160 American vessels, of 102,479 tons, were transferred to foreign flags in 1916. On Feb. 5 1917 the President by executive order forbade the sale, lease or charter of American vessels to foreign flags without the approval of the Shipping Board.

In the spring of 1920 a most important measure known as the Merchant Marine Act of 1920, or the Jones law (from Senator Wesley L. Jones, Chairman of the Committee on Commerce), was finally passed by large majorities in Congress and signed June 5 by President Wilson. This Act solemnly declared it to be the purpose of the American people to possess a merchant marine capable of carrying "the greater portion" of their commerce and to serve as a naval or military auxiliary in time of war, this merchant marine "ultimately to be owned and operated privately by citizens of the United States." A new Shipping Board of seven members, fairly representative of political parties and of all sections of the country, was authorized in the Act and given large authority over the merchant marine. This Board was directed to sell the Government-owned tonnage to private owners "as soon as practicable." Postal subsidies and encouragement to new and necessary shipping routes were provided for. Deferred rebates and discrimination against shippers were forbidden. The coastwise law barring foreign ships was extended after Feb. 1 1922 to the trade between the Philippines and the United States. Benefit of preferentially low railway rates on imports and exports was reserved to American vessels wherever their capacity is sufficient. Encouragement was given to American marine insurance, and to the American Bureau of Shipping, the "American Lloyd's." A new and favourable system of ship mortgages was provided. American vessels in foreign trade were exempted from excess profits taxes on condition that the amount of the exemption and twice as much more of the capital of the owners were applied to the building of other ships in the United States. The President was directed to secure the amendment of provisions in commercial treaties that prevented the United States from imposing discriminating customs taxes and tonnage dues on goods imported in ships of foreign registry. President Wilson refused to carry out this last-named requirement on the ground that the action indicated would provoke the resentment of foreign ship-owners and their Governments. The Treasury Department failed to prepare regulations for the application of the clause exempting American foreign-trade ships from excess profits taxes. Preferential treatment for American ships in the dispatch of imports and exports hauled at low rates on American railways was not made effective by the Shipping Board and the Interstate Commerce Commission, whose cooperation was necessary for the actual enforcement of the law.

**Statistics.**—The amount of shipbuilding, the total registered overseas and coastwise tonnage, the total merchant marine, and the proportion of American imports and exports conveyed in American ships for the six fiscal years ending June 30 1920 are as follows:—

Year	Ship-building	Registered for Foreign Trade	Enrolled or Licensed for Coastwise Trade	Total Merchant Marine	Proportion of Value of Imports and Exports Carried in American Ships
	Gross tons	Gross tons	Gross tons	Gross tons	Per cent
1915	225,122	1,862,714	6,486,384	8,369,429	14.3
1916	325,413	2,185,008	6,244,550	8,469,049	16.3
1917	664,479	2,440,776	6,392,583	8,871,037	16.6
1918	1,300,868	3,599,213	6,282,474	9,924,518	21.9
1919	3,326,621	6,665,376	6,201,426	12,907,300	27.8
1920	3,880,639	9,924,694	6,357,706	16,324,024	42.7

A new Shipping Board, appointed in June 1921, by President Harding, headed by Albert D. Lasker of Chicago and including Admiral William S. Benson in its membership, quickly effected an important reorganization of the executives of the Board, installing a group of practical shipping men as officials of the Emergency Fleet Corporation, and committing to these men the active management of the government-owned merchant fleet. Following this reorganization, the new Shipping Board addressed itself to the working out of a comprehensive subsidy system for postal liners and cargo ships, intended to facilitate the sale of the government-owned fleet to private owners, as directed by the Merchant Marine Act of 1920.

(W. L. M.)

**SHOCK**, in surgery (see 24-991\*).—Experience during the World War has thrown new light on the nature of "shock" in pathology. The first effect of an injury is usually to produce a state resembling that of fainting. This is clearly produced through the nervous system and is recovered from more or less rapidly, supposing that the injury is not in itself sufficiently severe to be fatal. This "primary shock," as it may be called, does not show itself to any important degree in the case of operations done under an anaesthetic. But it has long been familiar to surgeons that another kind of shock may appear during or after an operation. This "secondary shock" was of frequent occurrence during the war of 1914-8 and the cause of many deaths. To define it, Cowell suggested the name "wound-shock." The symptoms are very difficult to distinguish from those of mere loss of blood, but it became obvious that it might be present although actual haemorrhage had been very slight. This fact is of significance in the interpretation of the actual pathology of the condition, as will be seen later. As indicated above, it does not show itself at once; it may, however, develop in less than an hour if the injury has been great, and primary shock may sometimes pass into it gradually without a period of recovery. It shows itself by a state of general collapse, with pallor, coldness, thirst, low blood pressure and the various consequences of this, such as vomiting, sweating and sometimes rapid shallow breathing. No evidence of heart failure or of paralysis of vaso-motor centres has been obtained. The higher nerve-centres do not suffer until the late stages. Pain is not a prominent factor. If the state has not been of long duration nor of severe intensity, it may pass off on warming and rest, but if left alone death nearly always ensues.

Observations made by Sir Cuthbert Wallace in operations before the war suggested to him that the actual injury to the tissues, and especially to muscle, played an important part. This surgeon noticed that operations involving much section or removal of tissues were more liable to produce shock. The fact might, of course, be also interpreted as the result of the irritation of nerves, acting subconsciously on the centres; but Quénu, a French surgeon, at an early date in the war, propounded the view that the serious effects of wounds are due to an absorption into the blood of toxic products arising in the injured cells. This view was confirmed by the recognition of the importance of early removal of the injured parts; operative procedure was pushed nearer and nearer to the fighting line as the war progressed. It was also noticed that, even after shock had developed, a marked improvement was frequently brought about by excision of the damaged structures. Experimental work by Bayliss and Cannon showed that it was possible to produce in anaesthetized cats a condition similar to that of wound-shock. This could be done by extensive injury to the muscles and skin of the legs. It was found that the results were identical whether the nerve channels from the injured tissues were severed or not, but that they were absent if the blood returning from the tissue was prevented from passing into the general circulation. Thus the name "traumatic toxæmia," proposed by Quénu, is an appropriate descriptive title for the state under consideration.

But what is the nature of the poison and how does it act? These are important questions in dealing with appropriate methods of treatment. The possibility of bacterial toxins has been definitely excluded, and although it cannot be stated that we have yet found the actual substance produced in wounded tissues, the work of Dale and his colleagues on the properties of a base called "histamine," which is formed by removal of carbon

dioxide from one of the component amino-acids found in the proteins of tissues, namely histidine, shows that we have to deal either with this compound or with a very closely related one.

Dale and Laidlaw found, in fact, that a small amount of histamine injected into the veins of cats or dogs produced a large fall of blood pressure, accompanied by the other signs of shock, which increased progressively until death. The heart was unaffected and continued to beat powerfully, although nearly empty of blood. Now, until the work of Dale and Richards, it was believed that to produce a fall of blood pressure without removal of blood or depressing the heart it was necessary that the muscular coat of the arterioles should be relaxed and thereby the peripheral resistance decreased. But the previous work had shown that histamine has the effect of causing contraction of all smooth muscle, including that of the arterioles. The fall of pressure produced by a very small dose of histamine remained a paradox until the work mentioned, which was published in 1918. In this research it was shown that the effect was due to a wide-spread dilatation of the capillary blood vessels. In order to appreciate the significance of this discovery, a few words are necessary on the reactions of the capillaries and on the importance of the volume of blood in circulation. Although various observations had been made indicating that the capillaries are not merely inert channels, but that their walls are capable of contraction and dilatation in response to chemical stimulation or nervous influence, there seemed to be difficulty in realizing how protoplasmic cells such as those of the capillary wall succeed in doing this. The changes of shape in amoeba and in pigment cells, nevertheless, show the possibility. Dale and Richards, by an ingenious series of experiments, demonstrated that histamine does actually cause a marked widening and opening-up of the capillaries of the body generally. It may also be pointed out that Krogh has recently shown the existence of a nervous regulation of these vessels, which appears to be of an antidromic nature, like that of the dorsal roots described by Bayliss. Now, when we observe how enormous a share of the total vascular system the capillaries make up, we realize what a large volume of the total circulating blood may be penned up or pooled in these vessels when they are dilated, leaving very little to be sent round by the heart to supply the organs with oxygen obtained by its flow through the lungs. The whole of the body is therefore suffering from want of fresh blood containing the oxygen necessary for its existence.

These facts have caused renewed attention to be paid to the question of the volume of blood in circulation. By the injection into a vein of an innocuous dye, which does not quickly diffuse out of the blood vessels, such as "vital-red" or better "congo-red" (Harris), the degree of dilution of the amount injected indicates the volume of the fluid part of the blood. When observations of this kind were made by N. M. Keith on men suffering from shock, it was found that, even when they had lost little or no blood, the volume actually in circulation was greatly reduced. Hence we are justified in postulating the presence of a toxic action dilating capillaries, an action similar to that of histamine.

It was early recognized that shock might be greatly exaggerated or even brought on by various conditions incidental to the state of the wounded man, or to the treatment necessary afterwards. Some of these throw additional light on the subject.

**Anaesthetics.**—Dale observed that a dose of histamine highly toxic to a cat under ether was innocuous to a normal animal. Thus there are processes in the healthy organism which either destroy the poison rapidly but are inactive under ether, or the anaesthetic itself makes the capillaries more sensitive. In any case, it was often noticed in the war that a state of shock came on during an operation under ether and that there was less risk with nitrous-oxide and oxygen.

**Haemorrhage.**—Since the serious nature of shock is due to the deficiency of circulating blood, it is obvious that when blood has actually been lost a lesser degree of capillary stasis will suffice to induce shock. This was also found to be the case, experimentally, by Dale and by Bayliss and Cannon. A practical conclusion as regards operations seems to be that loss of blood should be avoided as far as possible and that means for replacing it by intravenous injection should be at hand in case shock makes its appearance.

**Thirst.**—There was always a notable demand for water by the wounded soldier. If he was already suffering from thirst when

\* These figures indicate the volume and page number of the previous article.

wounded, his blood volume was diminished. Water is a valuable remedy and, as absorbed from the alimentary canal, it is very effective in restoring the blood volume. As we shall see, it is the actual volume of the blood, rather than its dilution, that is of consequence. Unfortunately, the vomiting frequently present in shock prevents this treatment in many cases. Water or saline solution may, however, be given by the rectum.

**Cold.**—Exposure to cold has a very potent exaggerating effect in shock. It may happen that spontaneous recovery takes place in the comparative comfort of the casualty clearing station, but, for the reason to be given below, it is not well to wait long if no sign of improvement is seen in a short time. It is difficult to give precise reasons why cold is so markedly deleterious. It may be the result of the generally depressing effect on all bodily functions, which would naturally be greater in states of inadequate circulation of blood.

**Anxiety and Fear** are recognized also as predisposing factors of shock. Perhaps the depressing effect is the cause, as with cold.

**Treatment.**—Since the cause of the trouble is the deficiency of blood in circulation, it is obvious that the chief remedy is to increase this. Much attention was given during the war to improving the methods of transfusing blood and there seems no doubt that many lives were saved by this means. But donors are not always available and it is clearly a matter of importance to possess, if possible, an artificial solution which can be used in unlimited amount. Simple saline or glucose solutions were soon found to be useless. They disappear from the blood in less than an hour. To prevent this disappearance, it is necessary to add to the solution some colloid which has an osmotic pressure equal to that of the colloids in normal blood. This is done in the "gum-saline" introduced by Bayliss. The solution contains 6% or 7% of pure gum arabic in addition to 0.9% sodium chloride. The reason for the addition of the colloid may be stated thus: the blood-vessels are impermeable to colloids, hence the osmotic pressure of these substances can manifest its effects. The important point is that it causes an attraction of water and thus prevents any rapid filtration by the blood pressure on the arterial side and brings about a reabsorption in the capillary and venous regions, where the blood pressure is lower than the osmotic pressure of the colloid. Thus a solution containing a sufficient amount of gum arabic is not lost from the circulation.

Of course, the blood actually in circulation is diluted by such injections, but the work of Gesell shows that the greater flow more than compensates for the lesser oxygen-carrying capacity per unit volume. Moreover, as the circulation improves, the capillaries begin to give up their stationary corpuscles to the general mass of blood.

When the state of shock is complicated by haemorrhage it might seem that the addition of blood itself is imperative. It is remarkable, however, that in actual experience the benefit of gum-saline was more obvious after haemorrhage than in severe cases of wound-shock without haemorrhage. It seems probable that these latter cases were such as to have arrived at that stage in which a second action of histamine shows itself. To this we may now turn. After large doses or prolonged action of smaller ones, the capillary blood-vessels become permeable to the colloids of blood as well as to the salts. The addition of solutions of colloids or even blood itself is useless in this stage. They are quickly lost. It was found by observations on wounded men that the plasma of the blood transfused was lost rapidly. Whether the effect on the capillaries is a direct one or whether it is due to the asphyxial state brought about by the low blood pressure is not clear at present. Krogh brings evidence that, when the capillaries are rapidly and widely dilated, there may be formed minute pores between the cells of their walls, which allow colloids to pass through. The fact warns us, in any case, not to allow the state of low blood pressure to last for any length of time.

Cases of shock in this stage were generally regarded as hopeless. It was not found possible to restore them either by blood or by gum-saline. Some experiments made later by Bayliss suggest, however, the possibility that further repeated injections might in some cases have been effective. Although the greater part of the fluid of the first injection was lost, it seemed that some improvement in the state of the capillaries resulted, since a second injection produced a slight permanent rise in the blood pressure and a third injection recovery.

Owing to the fact that gum-saline is quite innocuous and can now be obtained in sterilized form from the dealers, it should always be at hand in operations for use if shock threatens, as also for accidents or serious haemorrhage from any cause.

See *Special Reports*, Nos. 25, 26, 27, *Medical Research Council* (London H.M. Stationery Office, 1919); E. Quénu, *La Toxémie traumatique* (Paris, Alcan, 1919); Bayliss, *Intravenous Injections in Wound-Shock* (London, 1918). (W. M. B.)

**SHORT, SIR FRANCIS JOB** (1857– ), English engraver (see 24.1007), was elected R.A. in 1911, and in the same year was knighted. In 1910 he became president of the Royal Society of Painters, Etchers and Engravers. His later work exemplifies every type of his activity. Among etchings, "On the Banks of the Bure" and "The White Mill, Canterbury" show his adherence to the use of line in that medium, and a version of Turner's "Ehrenbreitstein to Coblenz" continues his series of translations of paintings. He also added "Moonlight on the Medway at Chatham" and "Dumbarton Rock" to the plates in etching and mezzotint completing Turner's "Liber Studiorum." Two aquatints, "The New Moon" (1918) and "Twixt Dawn and Day," show broad handling and remarkably rich quality in the darks; and two mezzotints, "Orion over the Thames" (1913-4) and "The Night Picket Boat at Hammersmith" (1914-5), are among his finest plates in a medium peculiarly his own.

**SHORTER, DORA** (Sigerson) (1866-1918), Irish poet, was born in Dublin, Aug. 16 1866. She was the daughter of Dr. George Sigerson, the Celtic scholar, and married in 1896 Clement K. Shorter (b. 1857), editor of the *Sphere* and other London illustrated papers (see 19.563). Her first volume of verse appeared in 1894, and she established a considerable reputation as a writer of lyrics and ballads; the subjects often religious, or drawn from the treasures of Irish legend, or in praise of the Irish country. Her *Collected Poems* were published in 1909, and she wrote one novel, *Through Wintry Terrors* (1907). She died in London, Jan. 6 1918. Two posthumous volumes of poems appeared in 1918 and 1919, as well as *A Dull Day in London and other sketches*, with a preface by Thomas Hardy, in 1920.

**SHORTT, EDWARD** (1862– ), British lawyer and politician, was born at St. Anthony's Hall, Newcastle-on-Tyne, March 10 1862. He was educated at Durham school and University, and in 1890 was called to the bar. In 1907 he became recorder of Sunderland and in 1910 a K.C. In 1910 he entered the House of Commons as Liberal member for Newcastle. In May 1918 he became Chief Secretary for Ireland, but in 1919 resigned and was appointed Home Secretary.

**SIAM** (see 25.2).—For the purposes of administration the kingdom of Siam is divided into 17 provinces (Monthon), the area of which is given officially at 484,128 sq. kilometres. The revised census figures for 1910-1 gave a pop. of 8,149,847, and the official estimate of the pop. for the year 1920 was 9,022,000.

On the death in 1910 of King Chulalongkorn he was succeeded by his son, the Crown Prince Maha Vajiravudh, who in 1917 assumed the title of King Rama VI. Under this monarch the work of consolidation and development progressed steadily. To foster the idea of the duty of national service among the elder generation the "Wild Tiger" Corps was established. The Siamese boy scout organization, of which the King became president, educates the younger generation on the same lines. The number of boy scouts was in 1920 over 15,000.

Among various changes may be noted the royal decree that all privy purse property should be subjected to ordinary taxation, the abolition of lottery farms and public gambling-houses, the strict regulation of the opium traffic, and the great development of football and other athletic sports. Under the patronage of the King, a Navy League was established, and the Red Cross Society was reorganized. The Red Cross Society has under its direction the Chulalongkorn hospital, the Pasteur institute and laboratories for the preparation of vaccines and serums.

The calendar has been revised. The Siamese year formerly dated from the foundation of Bangkok. It now corresponds with the Buddhist era. The new year begins on April 1 and terminates on March 31. Hence April 1921 to March 1922 is, in the Siamese calendar, B.E. 2464. The day is divided into two periods of 12 hours each as in Europe, except in the railways and the post and telegraph department, where the 24-hour day is used.

On July 22 1917 Siam declared war on Germany and Austria-Hungary. Enemy aliens were interned, and later sent to internment camps in India. A military mission was sent to Europe early in 1918, and a Siamese military contingent landed at Marseilles in Aug. of the same year. This contingent comprised motor ambulance transport, which rendered efficient service on the western front, and an aviation corps. The aviators were trained by French officers, and although many had gained pilot's certificates, hostilities ceased before the corps was prepared to commence operations. The contingent returned to Siam in 1919. Siam was represented at the Versailles Peace Conference by three delegates, who signed the general Peace Treaty on behalf of their country.

The main clauses affecting Siam are Articles 135, 136 and 137. In Article 135 Germany recognizes that all treaties, conventions and agreements between her and Siam, and all rights, titles and privileges derived therefrom, including all rights of extra-territorial jurisdiction, terminated as from July 22 1917. In Article 136 all goods and property in Siam belonging to the German Empire or to any German State, with the exception of premises used as diplomatic or consular residences or offices, pass *ipso facto* and without compensation to the Siamese Government, while the goods, property and private rights of German nationals in Siam shall be dealt with in accordance with the provisions of Part X (Economic Clauses) of the Treaty. By Article 137 Germany waives all claims against the Siamese Government on behalf of herself or her nationals arising out of the seizure or condemnation of German ships, the liquidation of German property, or the internment of German nationals in Siam, this provision not to affect the rights of the parties interested in the proceeds of any such liquidation, as governed by the provisions of Part X (Economic Clauses) of the Treaty. Under the Treaty Siam became a member of the League of Nations, and took part in the first Assembly of the League at Geneva in 1920.

**Agriculture.**—Owing to deficient rainfall in 1919, rice, the main agricultural crop of Siam, was barely sufficient to supply the needs of the population, and the price rose to five times pre-war rates. To meet the deficiency the export was prohibited, but was resumed in 1921. The question of extensive irrigation works, which had been considered in the previous reign, was again investigated in 1915, and important works were started. The difficulty of obtaining steel work from abroad during the war delayed their progress but work on the Prasak scheme, estimated to cost some 13,000,000 ticals, was afterwards vigorously pushed forward, and was expected to be completed in 1922.

**Army and Navy.**—The law of 1903 making military service compulsory was revised in 1917. Every able-bodied man of 21 to 22 years of age is liable to be called to military service for a period of two years with the colours, passing afterwards into the reserve, of which there are three classes according to age. There are various military schools for the training of officers, non-commissioned officers, aviators, military engineers, etc., as well as a General Staff school. The arms and equipment are modern, and in 1914 a national target factory was established. The navy is recruited from the maritime population under the military service law. There are some 5,000 men available for service afloat, with a reserve of 20,000. In 1920 a 35-knot destroyer was purchased from the British Admiralty and rechristened the "Phra Ruang."

**Communications.**—On the declaration of war the northern and southern State railways were amalgamated under a Commissioner-General, H.R.H. Prince Purachatra of Kambaeng Bejra. The personnel, which had included German engineers, became chiefly Siamese, with a few engineers of Allied nationality. A standard metre gauge was adopted for all lines. The southern line through the Malay Peninsula was originally constructed of metre gauge to permit of through connexion with the Federated Malay States railways. The work of converting the northern line, first built to the normal gauge of 4 ft. 8½ in., was begun. A through service of trains from Penang to Bangkok was opened on the southern line in 1918, and in March 1920 railhead reached the Siam-Kelantan boundary. The northern line reached Chiangmai in 1920, and the Bandara-Swankak branch was then under construction. The length of State lines in 1920 was: opened 2,215 km., under construction 211 km., and under survey 460 km. The average capital cost per km. of open line was tcs. 54,584.

**Education.**—There were in 1920 over 380,000 pupils receiving primary education, of whom 250,000 were being educated by priests in the Buddhist monasteries, 100,000 in local and private schools, and 30,000 in schools directly under the Ministry of Education. Secondary education, reaching a standard approximating to that of the London University Matriculation, is provided for by the Ministry of Education, with 120 schools attended by 8,500 pupils, by the two Royal Pages' schools and King's College, under the direct patronage of the King, and by certain missionary schools. In 1917 the Chulalongkorn University was opened at Bangkok with four Faculties—Medicine, Arts and Science, Engineering and Political Science. It includes hostels for 100 resident undergraduates.

**Finance.**—Annual revenue rose from tcs. 17,334,469 in B.E. 2437 (1894-5) to tcs. 86,494,066 in B.E. 2460 (1917-8). During this period the expenditure increased from tcs. 12,847,165 to tcs. 74,149,289. The national debt consisted in 1921 of two sterling loans both of 4½%, one for £1,000,000 floated in 1905, and one for £3,000,000 floated in 1907, both free of taxes present or future, levied by the Siamese Government and repayable by yearly drawings. The 1905 loan will be entirely paid off in 1945, and the 1907 loan in 1947. In 1909 a loan of £4,000,000, increased in 1913 to £4,750,000, was negotiated with the Federated Malay States Government. This loan is exclusively for constructing railways in the Malay Peninsula, the amount advanced is limited to £750,000 in any one year, and interest is at the rate of 4% on the money actually received. The amount actually advanced on this account to March 31 1921 was £3,880,000, when the total debt of the kingdom stood at £7,312,560.

The mint was closed to the free coinage of silver in 1902, and, supported by the Treasury, exchange had steadied to around tcs. 13 to the pound sterling by 1909. In 1917 and 1918 the rate was maintained at tcs. 13-02 to the pound sterling, but by 1918 the Treasury had sold to the banks tcs. 77,000,000, representing nearly 66,000,000 sterling. As a result of these sales a large proportion of Treasury funds was transmitted abroad. The rise in the price of silver nearly denuded the country of silver coinage, and in 1920 the exchange rose to tcs. 10 to the pound sterling and over. The gold standard reserve fund, established for the maintenance of the gold value of the tical, remained untouched on March 31 1918 at £1,222,146.

**Trade.**—For 1917-8 the value of imports exceeded tcs. 97 million, including tcs. 3½ million of gold leaf and treasure. This shows an increase of some 10 millions over the previous year and 22 millions over 1915-6. The exports amounted to tcs. 123½ million, showing an increase over the previous year of tcs. 2 million and over 1915-6 of nearly tcs. 18 million. The value of rice exported was over tcs. 97½ million and of teak tcs. 5½ million.

**Justice.**—The Penal Code became law in 1908, and the preparation of other codes continues. All courts are under the Ministry of Justice. The judiciary is composed of native or European-trained Siamese judges, assisted in cases where foreigners are concerned by European legal advisers. In commercial cases where there is no Siamese statute or precedent customary law is administered. Where precedents are wanting the Siamese courts are guided generally by English statutes and cases as circumstances admit. On the outbreak of war with Germany and Austria a prize court was established to deal with enemy ships seized "*jure belli*." Twenty-five enemy vessels were taken, and condemned as lawful prize by this court.

**Public Health.**—Modern sanitation began in Siam in 1897 with the creation of a Public Health Department under a director-general, assisted by a medical officer of health and a city engineer. The principal developments have been the inspection of cattle and meat and the regulation of the public abattoirs under veterinary inspection, the establishment of infectious diseases hospitals, medical treatment of the insane, quarantine, registration of births and deaths, compulsory notification of plague and cerebro-spinal diseases, and compulsory vaccination and revaccination against smallpox. An efficient public-health laboratory has been organized under the department. Bangkok is now efficiently drained and lighted. Pure filtered water is supplied from the Government water works. New roads have been cut through congested districts, and numerous bridges have been built over the canals which intersect the city. On the outskirts new residential quarters have been laid out, with broad roads lined with trees. (A. C. CA.)

**SIBELIUS, JEAN JULIUS CHRISTIAN** (1865- ), Finnish musical composer, was born at Tavastehus, Finland, Dec. 1865. He was educated at Helsingfors, and later studied music at Berlin and Vienna. In 1916 he became a professor of literature at Helsingfors. His orchestral works include "Romance in C" (1890); *Karelia* (1893); *Frihlingssied* (1893); *Finlandia* (1905) and five symphonies (1897, 1901, 1905, 1910, 1915). He also composed many songs and pianoforte pieces. His music to the tragedy *Kuolema* (1904) contains the "Valse triste," which has gained wide popularity. In 1921 he visited England and produced his 5th symphony.

**SIBERIA** (see 25.10).—The name Siberia now generally excludes the Steppe provinces but includes Kamchatka and Russian Sakhalin.

Little progress has been made in the mapping of the wide tracts between the great rivers or the mountainous regions in the south. Even in the existing maps of southern Siberia little reliance can be placed on the detail except near the railway. There are no large scale maps of northern Siberia. The whole course of the Yenisei river has been mapped on a large scale, the shores of Lake Baikal have been surveyed and geological exploration in the Amur basin and some parts of the upper Lena basin has resulted in accurate maps.

Kamchatka contains a notable range of volcanoes which forms part of the Pacific ring. Forty have been located of which 14 are active. The loftiest active volcano, the loftiest mountain in Siberia, is Klyuchevskaya, 16,130 feet. Koryatskaya is 11,522 feet.

Investigations in Lake Baikal have shown that there are three basins of unequal extent and depth. The southerly basin has an extreme depth of 791 fathoms, and is separated by a shoal ridge of less than 300 fathoms from the middle and most extensive basin which reaches 832 fathoms in depth. The northern basin does not exceed 540 fathoms. On the W. of the lake the deep water goes in-shore but on the E. the coastal waters are shoal. The area of the lake is 13,200 sq. m.; its surface is 1,561 ft. above sea level.

New surveys of the Arctic coast by Tolmachev, Vilkitiski and others have resulted in considerable modifications in the chart. Shitkov explored the Yamal peninsula and cleared up some doubtful points in its hydrography. The small islands between the Gulf of Yenisei and Taimir peninsula have proved to be more numerous than was supposed and Taimir Gulf has been found to be relatively narrow. Cape Chelyuskin lies in lat. 77° 42' N. Nikolas Land and other islands have been discovered to the N.W. of this cape, and new discoveries have been made in the New Siberia and Wrangel Is. (see Arctic Regions). There is still some doubt about the configuration of the coast-line between Cape Chelyuskin and the Lena delta. Hydrographical surveys have resulted in the discovery of some harbours on the Arctic coast including several in Taimir Land; Tiski Bay, E. of the Lena delta; and Chaun Bay in long. 170° E. Surveys in the Sea of Okhotsk have shown that the best harbours are Yamskaya Bay; Ola Bay, off Taiui Bay; and Port Ayan. Okhotsk is falling into decay owing to its poor site. In Kamchatka Baron Korla Gulf has been found to contain several good harbours. In the Maritime province the best harbours, in addition to Peter the Great Bay, are de Castries Bay, Imperial Bay and Olga Bay. De Castries Bay, a little S. of the Amur mouth, affords a far better and more accessible harbour than the Amur estuary. The Tartar harbours are closed by ice from Nov. to April or May and the Okhotsk harbours for a month or two longer.

**Population.**—There has been no census since 1897 but in 1915 the pop. was estimated at 10,377,900 on the basis of the last census and the yearly rate of increase. It was distributed as follows:—

Governments and Provinces <sup>1</sup>	Area in sq. m.	Population <sup>2</sup>	Density per sq. m.
Tobolsk (Govt.) . . . . .	535,739	2,085,700	3·9
Tomsk (Govt.) . . . . .	327,173	4,053,700	12·0
Irkutsk (Govt.) . . . . .	280,429	821,500	2·5
Yeniseisk (Govt.) . . . . .	981,607	1,143,900	1·1
Yakutsk (prov.) . . . . .	1,530,253	332,600	0·2
Transbaikalia (prov.) . . . . .	238,308	971,700	4·0
Amur (prov.) . . . . .	154,795	261,500	1·6
Maritime or Primorsk (prov.) . . . . .	266,486	631,600	3·0
Kamchatka (prov.) . . . . .	502,424	41,600	0·1
Sakhalin (prov.) . . . . .	14,668	34,000	0·5
Total . . . . .	4,831,882	10,378,100	2·0

<sup>1</sup> These indicate the administrative divisions in force under the empire. The present (1921) divisions are uncertain and unstable.

<sup>2</sup> The pop. estimates are probably somewhat too high.

The two Steppe provinces, Akmolinsk and Semipalatinsk, which are geographically part of Siberia, though they were administratively distinct under the late imperial regime, have a combined area of 403,394 sq. m. and an estimated pop. (1915) of 2,421,400. The figures given above include native tribes (see below).

**Colonization.**—The Russians number over 85% of the total pop. of Siberia as a whole and about 93% of the total pop. of western Siberia (Tobolsk and Tomsk). The number of settlers entering Asiatic Russia (including the Steppe provinces) from Russia in Europe rose from 141,000 in 1906 to 619,000 in 1909. For some years after there was a decline, due, it is said, to a succession of good harvests in southern Russia: in 1912 and 1913 the annual immigration was little over 200,000. In 1914 it was 242,000. From 1906 to 1914 nearly 3,000,000 Russians entered Asiatic Russia, about 2,000,000 of whom went to Siberia. The Siberian railway zone continued to attract most settlers in western and central Siberia but many went to the Baraba steppe, the Altai region and the district round Minusinsk and the upper Yenisei. The Uryankhai region around the head streams of the Yenisei in the Sayansk mountains, which is nominally part of outer Mongolia under the suzerainty of China, contains many Russian settlers and for some years has been more or less under Russian control. In Transbaikalia much land is occupied by Cossacks and their descendants, and natives (largely Buryats), but in the upper Amur and the Ussuri valleys there are considerable areas of Russian settlement. The efforts, however, that were made by the State before 1917 to attract colonists to the Amur and Maritime provinces met with somewhat meagre response. Attempts to colonize Kamchatka have been practically abandoned and for many years Russian Sakhalin has failed to attract settlers.

North of lat. 58° N. in western Siberia, and lat. 54° N. in eastern Siberia, there are very few Russians permanently settled. Total exemption from military service and other privileges which the State offered colonists in the lower valleys of the Yenisei and Lena did not succeed in attracting many settlers. The migration of Chinese and Koreans to the Amur and Ussuri valleys and the Transbaikalian region was marked for many years. The Chinese came as temporary labourers but the Koreans were more inclined to become permanent settlers. Japanese artisans are found throughout eastern Siberia. In 1914 the Russian Government was making attempts to exclude Asiatics at the same time that it offered inducement to Russians to settle in the Far East.

**Native Races.**—While no strictly ethnological classification of Siberian natives is yet possible, it is recognized that the tribes of the extreme N. and E., even if they differ from one another, have certain characteristics in common which distinguish them from later arrivals in Siberia. For these earlier tribes, who may possibly have migrated to Siberia from America at a very early period, the name Palaeasiats is used by Schrenk and Palaeo-Siberian by Czaplicka. For later tribes the term Neo-Siberian has supplanted Ural-Altaians to which there are linguistic and ethnological objections. Czaplicka classifies the native tribes of Siberia as follows, taking numerical statistics from Patkanov, who based his estimates on the census of 1897 which gives the latest trustworthy data: i. Palaeo-Siberians. i. Chukchee, 7,335. ii. Kamchadal; southern part of Kamchatka, 2,805. iii. Ainu; in southern Sakhalin and Yezo, 1,457. iv. Gilyak; near Amur mouth and in northern Sakhalin, 4,649. v. Eskimo; shores of Bering Strait, 1,307 (in Asia). vi. Aleut; in Aleutian Is., 574. viii. Yukaghir; between the lower Yana and lower Kolima, 754. ix. Chuvany; S. of Chaun Bay, 453. x. Ostyak of Yenisei; on the lower Yenisei, 988. ii. Neo-Siberians. i. Finnic tribes (a) Ugrian Ostyak; lower and middle Ob, 17,221. (b) Vogul or Maniza; middle Ob, 7,476. ii. Samoyedic tribes; in far N. from Europe to Khatanga mouth, 12,502. iii. Turkic tribes (mainly outside Siberia) (a) Yakut; from the Lena to the Amur and Sakhalin, 226,739. (b) Turco-Tatars of Tobolsk and Tomsk, 176,124. iv. Mongolic tribes (a) Kalmuk or Eleut; practically all outside Siberia (b) Mongols proper or Kalkha, 402. (c) Buryat; around Lake Baikal, 288,599. v. Tungusic tribes (a) Tungus; far eastern Siberia, 62,068. (b) other Tungusic tribes, totalling 14,439, viz. Chapagir; on the lower Tunguska; Goldi; on the lower Amur; Lamut; on the shores of Sea of Okhotsk; Monagir; on the middle Amur; Oroche; E. of the lower Amur; Orochon; on the Olekma; Oroke; in Sakhalin; and Solon; S. of the middle Amur. Tribes who live in the more fertile parts seem to be increasing in numbers but those who occupy the more barren regions of the N. are dwindling. The natives probably do not exceed one million.

There is much disease, particularly among the native tribes, although the climate itself is not unhealthy. In addition to goitre, leprosy occurs in the Lena and Amur valleys and elsewhere. Smallpox is endemic in many parts and tuberculosis is prevalent. Cholera is never absent in the Far East and occasionally assumes the proportions of an epidemic. Plague sometimes enters from Manchuria. Venereal diseases are rampant throughout Siberia. A curious nervous affection known as Arctic hysteria is common among the natives of the far north. It is not infrequently associated with melancholia and suicide. The hysterical manifestation of Shamanism may not be impossibly be associated with this nervous affliction.

**Education.**—The last statistics date from 1912 when there were 6,245 schools in Siberia with a total of 341,271 pupils. The number of pupils per 1,000 of the pop. was thirty-six. Out of every 100 persons under nine years of age only 16 could read and write.

**Towns.**—Towns situated on or near the railway have grown rapidly but others have made little or no progress. In 1914 towns with a pop. of 10,000 or over numbered at least 21 compared with 17 in 1900; but estimates of the pop. of Siberian towns vary considerably and must be accepted with reserve. The largest towns are Tomsk (112,000) and Irkutsk (113,000), the capitals of western and eastern Siberia respectively. Omsk (128,000) is really a Siberian town but actually within the Steppes. Other large towns in western Siberia are: Novo-Nikolaevsk (63,000), a centre of rapid growth situated where the Siberian railway crosses the Ob; Barnaul (52,000) and Biisk (28,000), both centres in the rich Altai region. Kurgan (35,000) on the Tobol, a great agricultural market; Tyumen (30,000) now on the railway and a focus for trade between Russia and Siberia; Tobolsk (21,000), a declining fur and fish market on the Irtysh; Kolvian (13,000) on the Ob, with agricultural interests; Mariinsk (13,000), a mining centre on the railway and Achinsk (10,000) a little farther east. In eastern Siberia other important towns are: the great port of Vladivostok (95,000); the two Amur ports and agricultural centres, Blagoveshchensk (76,000) and Khabarovsk (53,500); Chita (73,000) with growing agricultural and commercial interests; Krasnoyarsk (73,000), the chief river and railway port of the Yenisei; Nikolsk-Ussurisk (34,700), a rising industrial and railway centre 70 m. from Vladivostok; Nikolaevsk (12,500), the port at the Amur mouth; the two mining centres on the Yenisei, Minusinsk (14,000) with agricultural interests, and Yeniseisk (10,000); Kansk (10,000) on the upper Yenisei and Siberian railway; Stryetensk (10,000), at the head of the Amur-Shilka navi-

gation; and Verkhne-Udinsk (9,500), a railway and industrial centre in Transbaikalia. The towns of the far N. are small and primitive. Yakutsk, a fur-trading centre on the Lena, has a pop. of 8,200 and Verkhoyansk, on the Yana, only 450. The pop. of Sredne-Kolimska, on the Kolima, which is the largest centre in the N.E. of Siberia, is 650. Petropavlovsk, the capital of Kamchatka, has fallen to some 500; Alexandrovsk, the capital of Russian Sakhalin, about 6,000, a figure, however, which includes more natives than Russians; and Okhotsk to less than three hundred.

**Agriculture.**—In western Siberia about 17,000 sq. m. are under crops (1913) but there are still great areas of natural grassland waiting for cultivation. In eastern Siberia agriculture has not made great progress except in the southern Ussuri plain: natural grasslands are scarce but there are many forest areas on the Amur which, if cleared, would afford good agricultural land. The area under crops in eastern Siberia is 2,800 sq. m. (1913). Agricultural methods in the W. have undergone some improvement, through the use of fertilizers and the importation of American agricultural machinery. Many flour-mills have been erected. Western Siberia sends its surplus wheat to Russia and eastern Siberia. The latter region also imports corn from Manchuria. In 1913 the total cereal production of Siberia was 68,200 cwt. and the average annual production (1908-13) was 50,200 cwt.

**Land Tenure.**—After the revolution of 1917 the State became the owner of all land in Siberia except some 5,000,000 ac. granted to Cossacks or other private persons. All other holders of land are tenants of the State, enjoying in some cases hereditary leases. The State ownership would seem to apply also to minerals, timber, fisheries and water power but some concessions have been recognized in favour of foreigners.

**Live Stock.**—The rearing of live stock has made more progress than agriculture. In 1913 the Steppe towns of Petropavlovsk and Omsk had become great centres for the export of meat to European Russia, drawing a large part of their supply from the Tomsk province. In the Transbaikalia, Amur, and Maritime provinces cattle-breeding promises to attain greater importance than agriculture, but the meat supply of eastern Siberia is partly dependent on imports from Manchuria. The successful acclimatization of the merino sheep in central Siberia holds promise of much wool production in the Yeniseisk and Irkutsk provinces. Pig-breeding is a growing industry in western and central Siberia and by 1914 bacon exports had become important. Reindeer-breeding is the chief occupation of most of the far northern tribes. Maral deer and other species of wapiti are bred in the Altai, the Maritime province and elsewhere for their horns, which to the Chinese have a reputed medicinal value. The official figures (in round numbers) for the number of live stock in Siberia in 1911 and 1914 are as follows:—

	Horses	Horned cattle	Sheep and goats	Pigs
1911	4,598,000	5,719,000	5,250,000	1,126,000
1914	4,840,000	6,541,000	5,745,000	1,428,000

The dairy industry has developed quickly, fostered by State encouragement and the export facilities afforded by the railway. In 1912 there were 1,060 coöperative dairies in the Tobolsk province, and 2,042 in the Tomsk province. The export of butter from western Siberia reached 35,000 tons in 1903 and 76,000 tons in 1913; in the latter year the home consumption accounted for an additional 75,000 tons. The industry is of less importance in eastern Siberia.

**Hunting.**—The fur industry retains great importance and was much stimulated during the early years of the World War by the high price of skins. But decrease of game is causing hunting in many parts of the N. to take a secondary place to fishing and reindeer-breeding. The sable became so scarce that from 1913 to 1916 its slaughter was forbidden. The white fox is becoming rare. The principal fur fairs are at Irbit (Feb.) and Yakutsk (July), but Ishim, Blagovyeschensk, Nikolaevsk and Anyui are also frequented by traders in search of furs. Yakutsk has also a trade in fossil ivory from the New Siberia Is.: in 1913 nearly 20 tons were sold. In order to prevent their extermination the few seals of the Commander Is. were protected for five years from 1912.

**Fishing.**—In western Siberia the most important fisheries are on the Ob. Tobolsk is the headquarters of the industry: Obdorsk, Beresov, Surgut and Narim are also important centres. At least 10,000 men take part in the fishery and the annual catch is about 15,000 tons. On the upper Irtysh Pavlodar and Lake Zaisan are centres of fishing. The fisheries of the lower Yenisei send S. about 3,000 tons every year. In Lake Baikal there are valuable fisheries both in summer and, through the ice, in winter. In the Lena and Kolima regions the natives live chiefly on fish but lack of transport facilities prevents exports. Fisheries in the Amur, Okhotsk and Kamchatka regions steadily increase in importance. The fish are mainly species of salmon but not the same as those in western Siberia. The fisheries are largely in Japanese hands but legislation in 1890 restricted to Russians all fisheries on the Okhotsk and Kamchatka coasts were closed to all fishing in order to conserve the fisheries. In 1913 the Okhotsk and Kamchatka fisheries resulted in a total catch of 46,000,000 salmon, most of which went to Japan.

Salmon caviar to the extent of 2,477 tons was exported from the same districts. Salmon-canning is a new industry; in 1913 the output from Kamchatka was over 500,000 tins, and from the lower Amur 100,000 tins. Attempts to send frozen fish from the Amur to Europe met with some success when begun in 1913. The fisheries of Russian Sakhalin are losing their importance. In the Sea of Japan the herring-fishing from Imperial and Peter the Great bays is growing in value.

**Timber.**—Siberian forests of commercial timber are estimated to cover about 470,000 sq. m. or about one-tenth of the total area of the country, but owing to absence of transport facilities only 150,000 sq. m. are considered to be exploitable. In western Siberia there is little trade in timber and the demands for home use and the hayoc of forest fires are decreasing the available supply. The principal saw-mills are at Tobolsk, Tyumen, Omsk, Novo-Nikolaevsk and Tomsk. In eastern Siberia the timber industry is confined to the Amur and Maritime provinces except in respect of the demand for fuel for railway, industrial and domestic purposes. The principal saw-mills are at Irkutsk, Blagovyeschensk, Nikolaevsk, Imperial Bay, Vladivostok and Alexandrovsk (Sakhalin). Export is from Vladivostok, Imperial, Olgi and Posiet bays to Australia, the British Isles and Japan. Before the war great efforts were being made to encourage this trade.

**Minerals.**—Gold is the most important mineral in Siberia. The Lena drainage area, especially the valleys of the Olekma and Vitim, is considered to be the richest gold-producing area in the world. All the gold worked is alluvial and the annual yield (1916) was some 400,000 oz. Bodaibo, connected by rail to the Vitim, is the centre of the industry. The gold-fields of the Amur valley when fully explored will probably prove to be even greater in extent. The new town of Zeya Pristan on the Zeya is the principal mining centre on the middle Amur. The Bureya valley is also rich in gold. On the lower Amur there are rich gold-fields near Lake Chylya. The Amur gold is alluvial and most of it is very fine. British interests control the principal gold-fields of both the Lena and Amur basins. Gold is reported from several places on the Sea of Okhotsk, in the Chukchee peninsula and in the Anadir region. The output in Transbaikalia is falling off. In the Yeniseisk region there are valuable deposits in the Abakan valley. In western Siberia the gold output is declining but, as placer mining gives way to quartz crushing, shows prospect of reviving. Quartz veins are rich in the neighbourhood of Ust-Kamenogorsk and Lake Zaisan. The gold-bearing rocks in Siberia as a whole, including the Urals, are estimated to cover over 800,000 sq. miles. The total output of gold in 1913 was estimated at 1,500,000 oz., of which over 90% was from eastern Siberia; but there is reason to doubt the accuracy of official figures. In the same year the number of men employed in the gold industry in Siberia was 56,400. Climate, labour and transport, apart from political difficulties, afford obstacles in the development of the industry. The output of silver has shown a decline for many years, but numerous rich deposits are known to exist in the Altai region and around Nerchinsk. The production of zinc has increased, largely due to the rich Tyutikha mines in the Priamur. Lead is obtained from these mines and also from the Altai mountains and Ust Orlinkaya on the Lena. Zinc and lead mines at Riderski in the Altai are linked to the Irtysh by a 70-m. narrow-gauge railway. Tin occurs in the Onon valley in Transbaikalia, but it is little worked. New deposits of graphite have been reported from Cape Dezhneva on Bering Strait. Copper occurs mainly in the Urals and in the Karkaralinsk district of the Kirghiz steppes, both of which regions are outside Siberia proper. There has been little if any progress in the production of iron except in the Urals, but valuable deposits of iron ore are reported in the Amgun valley near the Amur mouth, in the vicinity of Vladimir and Olgi Bays in the Priamur, in many parts of the Altai and near Karkaralinsk in the Steppes. Considerable coal deposits of varying quality have been located, but comparatively few are mined. Want of markets and transport facilities are drawbacks even where the coal is of good quality. The most promising deposits are the Kuznetsk beds in the Altai region which contain coking coal; beds around Cheremkhovskoe, 70 m. W. of Irkutsk, where some 5,000,000 tons of lignitic coal are mined annually, principally for use on the railway; the Suchan mines, 60 m. from America Bay, on the Sea of Japan, and the Mongugai beds near Amur Bay on the Tartary coast. The Mongugai beds and those at Due in Sakhalin both consist of good anthracitic coal but neither is seriously worked. Coal in the Amur and Lena valleys and Transbaikalia is chiefly lignitic. There are large deposits of lignite at Baron Korfa Gulf in Kamchatka. In the Kirghiz steppe coking coal is worked at Ekibastuse. The mines, which are controlled by a British company, are connected with the Irtysh at Yermak by a railway 70 m. in length. Petroleum-bearing strata exist on the eastern shores of Lake Baikal and near Nabilski Bay in Sakhalin, but the oil is not exploited.

**Manufactures.**—Manufactures on a large scale have made little progress except in engineering works and repair shops for the railways. The competition of the Ural iron foundries, which have better transport facilities, has adversely affected the Siberian foundries, but a few persist, notably at Petrovsk in Transbaikalia, Blagovyeschensk and Tyumen. At Ekibastuse in the Steppes the zinc and lead ores from the Riderski mine are smelted. Some river ports, as Khabarovsk, Blagovyeschensk, build and repair vessels.

Tanneries, tallow factories, brickworks and breweries are widely scattered. Only 7-6% of the pop. is estimated to be engaged in manufacturing industry (1914).

**Communications.**—Efforts to open up communication with Siberia by its northward flowing rivers and the Arctic Ocean have met with some success, but access by this route is possible only in the height of summer. Experience has shown that during Aug. and Sept. ice seldom presents any real difficulty in the Kara Sea and a steamer can rely on making the estuary of the Ob or Yenisei. One or two vessels take this route annually. Along the eastern part of the Arctic coast the only regular navigation is by occasional vessels between the mouth of the Kolima and Vladivostok.

The Ob affords 17,000 m. of navigable waterways, but the delta impedes communication with the Arctic Ocean. Seagoing vessels can reach Obdorsk, but large vessels have to lie at Nakhodka Bay in the Gulf of Ob. River steamers ascend the Ob to Biisk, 2,059 m. from the sea, and the Irtysh to Lake Zaisan, 3,100 m. from the sea. The Ob-Yenisei canal between the Ket and the Kas is accessible only to small barges. In 1915 there were 350 steamers and several hundred barges on the Ob and its tributaries. The Yenisei is navigated to Minusinsk, 2,045 m. from the mouth. Small seagoing vessels can reach Yeniseisk, but larger vessels discharge and load at Golchikha (Ghlgikha) in the delta. The Yenisei is the only Siberian river for which sailing directions and large-scale charts are published. Beacons and buoys assist navigation. In 1915 there were 60 steamers on the Yenisei. The tributaries are of little value for navigation. The Lena has a navigable length of 2,760 m. to Kachugorsk, 230 m. from Irkutsk, the nearest point on the railway. In 1914 there were some 30 steamers on the river, mainly between Yakutsk and Vitimsk. The Vilyui, Aldan and Vitim are tributaries on which a few steamers ply. The Amur with the Shilka is navigable for 2,400 m. to Stryetensk on the Siberian railway. There are many sandbanks, but vessels drawing 3 ft. can make the whole journey. The river is buoyed and marked and supplied with a few dredgers. Seagoing vessels stop at Nikolaevsk in the delta, but if the stream was dredged in a few places they could reach Khabarovsk. In 1916 there were about 400 steamers and several thousand barges on the Amur and its navigable tributaries. Practically all the vessels were Russian, although Chinese vessels have equal rights down to Khabarovsk. On the Sungari, the Manchurian tributary of the Amur, there is Chinese and Japanese shipping. The Ussuri is navigable throughout its length. Steamers ascend the Ussuri and Sungacha to Kamen-Ribolov, on Lake Khanka, 500 m. from Khabarovsk. Navigation on Lake Baikal has become less important since the construction of the railway round the southern end. In addition to two powerful ice-breakers there are about 12 steamers on the lake, some of which ascend the Selenga. The shores of Lake Baikal are well provided with lighthouses. The best harbors are Baranchuk on the west and Misovski on the east. Both are provided with breakwaters and wharves and are on the Siberian railway.

In 1916 the railway mileage in Siberia was approximately 6,800 m., not counting the Chinese Eastern (trans-Manchurian) railway. The Amur railway was built between 1908 and 1916. It marks a reversion to the course originally projected for a railway to the Pacific and provides a through route independent of Chinese territory. The Amur railway is a single track linking Kuenga via the Amur valley with Khabarovsk, 1,295 m.; the embankments and bridge piers are built for a double track. There are branches to the Shilka river at Chasovaya, and to the Amur at Reinoval, Chernyayeva, Blagoveshchensk, Innokentievskaya, and Pashkova. The bridge across the Amur at Khabarovsk is 7,038 ft. in length and has 22 spans. In western Siberia the line from Petropgrad to Tyumen has been extended via Ishim to Omsk on the original Siberian line. A line from Ekaterinberg destined to reach Tobolsk goes via Irbis and ends at Saitkovsk on the Tavda river. The Altai railway from Novonikolaevsk to Barnaul (with a branch to Biisk) and Semipalatinsk, 408 m., was opened in 1915. It serves mining and agricultural interests in one of the most promising parts of western Siberia. The new line from Achinsk to Minusinsk, 300 m., opens a rich agricultural district in the valley of the upper Yenisei and tributaries. From Tatarskaya, 105 m. E. of Omsk, a line goes S. to Slavgorod, 196 m., in a region which in 1913 was attracting settlers. From Yurga, 385 m. W. of Krasnoyarsk, a line to Kolchugino, 200 m., taps rich coal-fields. These two lines were built by private enterprise. The Siberian railway is now double-tracked from Omsk to Karinskaya where the Stryetensk and Amur line begins. Some of the bridges still require to be widened. There is a double track from Nikolsk-Ussurisk, the junction of the Ussuri and Chinese Eastern railways, to Vladivostok. A line 93 m. long connects the Suchan coal-mines with Vladivostok. During the years 1915-6 the Siberian rolling-stock was much increased from the United States, and new railway shops were erected at Pervaya Ryeka near Vladivostok.

The telegraph system has been extended into Arctic Siberia: lines follow the Ob to Beresovo, the Yenisei to Turukhansk and the Lena to Yakutsk and Vilyuisk. There are lines from Yakutsk to Okhotsk and from Khabarovsk to Nikolaevsk with connexion to Sakhalin. The Siberian telegraph system is linked via Semipalatinsk with that of Turkestan, and via Chuguchak with that of Mongolia. A second line to Mongolia between Kosh Agach, on the frontier, and Kobdo was incomplete in 1921. The Siberian and Chinese

systems join at Kyakhta. Wireless telegraph stations exist in many places in the far N., and in 1916 were working at Cape Mare Sale in the Yamal peninsula; Dickson I. at the Yenisei mouth; Novonikolaevsk and Markovsk on the Anadir; Gizhiga Bay; Okhotsk; Khabarovsk; Nikolaevsk; Petropavlovsk in Kamchatka; Iman on the Ussuri and Vladivostok.

**SICKERT, WALTER RICHARD** (1860- ), British painter, was born at Munich, May 31 1860, the son of the painter, Oswald Adalbert Sickert, a well-known contributor to *Fliegende Blätter*, and grandson of Johannes Sickert of Altona, painter and lithographer. Walter Sickert studied painting and etching under Whistler in Tite Street, Chelsea, but in 1885, following the advice of Degas, began to paint from drawings instead of from nature. His first work on these lines, "Mammoth Comique," was published in the *Yellow Book*. The dramatic quality of his work owes much to his study of the technique of wood engraving and to his interest in the work of John Leech and Charles Keene, while he was also much influenced by Wilhelm Busch (see 4.869) and Adolf Oberländer (see 19.046). His subject pictures include "Mamma mia po' areta" (1903), "Noctes Ambrosianae" (1906), "The Camden Town Murder" (1906), "Army and Navy" (1913), "Ennui" (1914), "Sinn Fein" (1915), "Pierrots on Brighton Beach at Night" (1915), "Baccarat at Dieppe" (1920) and "Supper at the Casino" (1920). He also produced some architectural paintings, including "Hotel Royal, Dieppe" (1900), "Miracoli" (1903), "Lansdowne Crescent" (1917) and "Pulteney Bridge" (1918), while his best known landscapes are "The Happy Valley" (1910) and "The Priory of Auberville" (1919). Examples of his work are in the British Museum, Tate Gallery, Bibliothèque Nationale, the Luxembourg and the art galleries of Manchester and Johannesburg. He became a member of the Société du Salon d'Automne, the Society of Twelve and the International Society, and was a fellow of the Royal Society of Painters, Etchers and Engravers. As a teacher he exercised a strong influence over the younger school of British painters.

**SICKLES, DANIEL EDGAR** (1825-1914), American soldier and diplomatist (see 25.36), died in New York City, May 3 1914. In 1912 after having served for more than a quarter of a century as chairman of the New York Monuments Commission he was removed following the discovery of a shortage of \$27,000. His last years were disturbed by financial difficulties.

**SIDGWICK, ARTHUR** (1840-1920), English scholar (see 25.39), was in his later years an ardent advocate of the abolition of compulsory Greek at Oxford, both in the interest of the classics and with the view of extending the field whence the university should draw its students. He was also a warm supporter of the admission of women to the university degrees, as he

had previously been both of woman suffrage and indeed of all aspects of the higher education of women. He died at Oxford, Sept. 25 1920.

His elder brother, WILLIAM CARR SIDGWICK (1834-1919), also a classical scholar and fellow of Merton College, Oxford, died at Rugby, Oct. 18 1919.

**SIDGWICK, ELEANOR MILDRED** (1845- ), British educationalist, was born in Scotland, March 11 1845, the daughter of James Balfour of Whittingehame and his wife Lady Blanche Cecil. She was thus the sister of Mr. Arthur James Balfour. She was educated at home, and in 1876 married the philosopher Henry Sidgwick (see 25.39). Mr. and Mrs. Sidgwick were both much interested in the advancement of the higher education of women, and were actively concerned in the founding (1880) of Newnham College, Cambridge, of which Miss Clough was the first principal. On the death of Miss Clough in 1892, Mrs. Sidgwick succeeded her as principal, and retained the position until 1910. In that year she retired, and until 1919 was bursar of the college. Mrs. Sidgwick shared her husband's interest in psychical phenomena, and in 1910 became secretary of the Society for Psychical Research.

**SIEGECRAFT AND SIEGE WARFARE.**—The earlier article on **FORTIFICATION** (10.679) reviews the prevailing ideas of defence against siege-warfare just before the World War. Opinion was then still unsettled on fundamental points, as well as on those differences in arrangement of the available elements of defence which have always divided the military engineering world into two or more schools. In the earlier days, Vauban and his competitors might disagree as to design, but they were in agreement as to purpose; and even at a later date, when the "bastion" school carried on its controversies with the "polygonal" or *caponnière* school, there was complete unity as to the necessity of permanent fortifications and substantial unity as to their functions. But the economic history of the 19th century, and the military history of its latter half, had brought the principles as well as the practice of fortification into the melting-pot.

Amongst many reasons for this, the following were the more important:—

(a) The increased size of armies, made possible by the credit system of finance, the universal service system of recruiting, the industrial system which could arm them, and the road and rail system which enabled them to disperse without risk in order to feed on the countryside, or to remain massed without starving through a breakdown of convoys, or both.

This increased size soon reached a point at which the old-fashioned fortress ceased to be an adequate base for the army's depots, or an adequate shelter in which to refit after defeat. There were signs of this even in 1870, although by that date the fortress had expanded into an entrenched camp of large perimeter, and between 1870 and 1914 the scale of field artillery, field transport and field ammunition for a given force, was practically doubled.

(b) The character of war, as between "armed nations," in which, in principle, a speedy decision by battle was sought at all costs, whereas warfare between the old professional armies had been prolonged from campaign to campaign. The objects sought by each side were now rather spiritual than material, or at any rate more general than local; and the fortress, which used to be judged according to the degree of protection it gave to the material objects of enemy desire—a city, a province, a port—came to be judged according to the degree in which it aided or impeded the manoeuvres of a field army seeking to win the war in battle. The task of fortification thus became much less positive and definite, and a programme of works took on a somewhat speculative character.

(c) Development of communications, which, besides the effects referred to under (a), had that of making civilized countries everywhere or nearly everywhere penetrable. The fortress as conceived of in the 18th and early 19th century, therefore, no longer exercised any power of control beyond the range of its guns or the striking radius of its semi-mobile garrison. And it could easily be "turned," and then either enveloped or—by

means of a masking force—eliminated as a factor in the campaign. Cases indeed remained, and still remain, of "obligatory points of passage," where local control of the route by means of fortification implies strategic control of the adjacent regions which are limited for their intercommunication to that route. Especially is this true still of rail communication. But in the main, armies and their transport can, in present-day west and central Europe, move where they will, except through areas directly under the tactical control of fortifications.

Further, the rapidity of communication as well as the wealth of routes enables a modern state to concentrate its defensive forces in the threatened region far more rapidly than of old, and the necessity for fixed defences, to gain time for the assembly of mobile forces, steadily declined.

(d) The development of the technique and manufacture of weapons of war, from about 1860, became so rapid that permanent fortifications of any given design were liable, like modern warships, to fall into obsolescence after a brief life of usefulness which contrasted sadly with the long career of a place like the old citadel of Antwerp, built in 1567 and besieged with all the forms and means of siegecraft in 1832.

Three out of four of these operating causes, it will be noted, are extrinsic, and one only intrinsic. In the case of the latter, operating alone, it is easy to conceive of a sort of duel between the gun constructor and the military engineer, analogous to the continued contest of gun *versus* armour plate. Few fortresses have ever had the good fortune to be fully up to date in design and equipment at the moment of siege. The reply of the French engineer who was asked what he would do if the Germans made the length of their scaling ladders greater than the depth of his ditches, expresses an inevitable condition of permanent fortification design. "It will always be easier," he said, "for the Germans to make scaling ladders than for me to dig ditches." Similarly, it will always be easier to make a new gun that will cut through a given thickness of concrete or armour than to increase the latter. For—questions of expense apart—the fort is a permanent sentry guarding against surprise, and the reconstruction of its works is a heavy piece of engineering which not only takes time but frequently renders them useless for the period of the repairs. Thus, in 1914, war surprised the fortress of Belfort when four of its principal works were under reconstruction. And if, as is generally the case, the programme of reconstruction is so drawn up as to minimize these risks, some part of the fortification system is sure to be obsolescent at any given moment. At any such moment, then, the question is not whether the means of attack have the upper hand—practically this is almost always the case—but whether the superiority is of such an order that the fortress or fort is useless. The new long-ranging powers of siege artillery in 1870, subjecting the area *intra muros* to concentric bombardment by an indefinitely numerous attacking artillery, and the demolishing powers of the superheavy siege howitzers evolved in Germany and Austria between 1900 and 1914—at least as against average concrete—were superiorities of that order.<sup>1</sup> But such cases are not frequent in military history, and it is more usual—in modern times, especially—to find a sort of thrust and parry, in which the artillery of the attack maintains a lead, but not a decisive lead.

The extrinsic causes in operation, meantime, were tending to bring about radical changes in the very meaning of fortification.

Outwardly, the controversies of the period 1885-1914 turned on technical questions, and chiefly on whether improvised fortifications could be shown to possess a resisting value practically equivalent to that of permanent fortifications. But in reality it was the feeling that the purposes and principles of fortification,

<sup>1</sup> Even in this instance, it must be admitted, the event was due in part to faulty designs which were not up to date even when laid down. Thus the new Antwerp forts (see ANTWERP) were only built to resist the 21-cm. mortar, although the Japanese had already, under very unfavourable conditions as to communications, managed to employ 28-cm. pieces at Port Arthur. On the other hand Fort Douaumont at Verdun, where the concrete was excellent (1892) and of adequate thickness, resisted a far heavier bombardment even by 42-cm. howitzers.

as they had been understood in the past, no longer responded to the needs of warfare, that produced the multiplicity of designs and proposals for artillery works and infantry works, armoured and unarmoured works, self-contained and mutually interdependent works, and so on, characteristic of the period of unsettlement. If most of this ingenuity remained, as it did, unconvincing, this was due to the fact that there were great general causes at work, of which, in default of war experience, only the existence and not the effects could be seen.

The size of armies steadily increased, all the European continental Powers being drawn into a competition based on the numbers of citizen soldiers who could be conscripted and financially maintained. The power of armament increased also, and with it the possibility of holding a wider front per unit of armed force. The special results of this, from the point of view of fortification and siegecraft, were the extension of perimeters and the thinness with which a circle or arc of investment could now be maintained. But the more general results were the more important. An army developed along a front of some hundreds of miles could no longer be worked by radial lines of communication centring upon one or two ring fortresses. In Napoleonic practice, a stronghold of some sort was always the centre of operations on which the army's movements pivoted; and only that portion of the theoretical base-line, which was in relation with the stronghold in use at the moment, formed what has been called the "effective" base. With the modern extended fronts, on the contrary, the effective base has widened more and more, until it practically coincides with the theoretical base. In other words, each part of a great army has its own lines of communication and its own sources, the connexion between the army line and the base line, or front edge of the home supply area, being a sheaf of more or less parallel routes. Whatever local variations may appear when portions of the system are isolated and examined by themselves, in the *ensemble* the strategic structure of warfare in civilized countries, had become linear.

But the more the front extended, the more difficult it became to collect any considerable force at one part of it for offensive effort. The "parallel battle in all its horror"—unit facing unit all along the line—was admitted to be the negation of generalship. But whether the dispositions were made *à priori* or by manoeuvre within the battle, whether envelopment or breakthrough were the method chosen, the parallel battle could only be avoided by reducing the living forces on certain passive or semi-passive parts of the line to a minimum. The small economies that could be effected on these parts by judicious tactical arrangements in the open—though certainly not to be despised—would no longer suffice to give the really considerable superiority of force necessary for decisive victory on the active front. The expedient of economizing force by sacrificing territory had become, under modern conditions of social and economic life, more dangerous than it had ever been before. Recourse was had, therefore, to fortification. It became one of the rôles, if not indeed the principal rôle, of permanent fortification to economize active living forces on the passive fronts—a principle already applied to field fortification within the tactical sphere. As soon as the competition in numbers had set in all over military Europe, we find permanent fortification developing a new tendency to be *linear* instead of *circular* in type. The ring fortress becomes a sort of end-redoubt to a long line of forts, usually drawn along some natural barrier. This tendency is shown in the creation of the Meuse line (Verdun-Toul), and the Moselle line (Épinal-Belfort) in France, the line Namur-Huy-Liège in Belgium, the Sereth line in Rumania, the Bobr-Narew-Bug line in northern Poland, and lastly the Diedenhofen-Metz and Molsheim-Strassburg-Istein lines in Germany. In the same way, most of the new ring fortresses that were not so connected by permanent works were so placed as to be keystones of a linear battle-system; conspicuous instances are the systems Lille-La Fère-Laon-Reims-Verdun and Dijon-Langres-Épinal. Of the rest—setting aside the fortresses of eastern Europe where poverty of communications enabled permanent works, as of old, to dominate great areas by dominating a few nerve-centres—we

find Antwerp, Copenhagen, Bucharest, Paris, designed as self-sufficing ring-fortresses, but not so much for playing a part in a battle-system as for serving as refuge for an army and a government that for the time being could not maintain its line of battle in the open field. Three of these four were called upon in the World War to play the assigned rôle and it is significant that not one of them did so successfully. Bucharest was evacuated as the result of an unsuccessful linear battle in the foreground; Antwerp was given up by the Belgian field army and Government as soon as the choice had to be made between standing a siege and continuing the war in the open; while in the crisis before the Marne the evacuation even of Paris was seriously considered.<sup>1</sup> Two ring-fortresses, Maubeuge and Besançon, were constructed in France in advance of the battle-system, in order apparently to draw upon themselves a part of the invader's effort condensed on the wings, and to control certain nuclei of communications which might otherwise be useful to him as he pressed forward. But the latter task is really that of a barrier-fort, and indeed Maubeuge was in process of being converted into a pure barrier position when war broke out, the old intention of an isolated defence *à outrance* having been abandoned. The linear systems with end-redoubts, on the other hand, performed in the war all the services for which they had been designed, with the exception of Liège-Namur; and even in this case failure—so far as there was failure—was due not to any vice of principle but to other factors.

The tendency to force a speedy decision in battle at all costs, specially characteristic of citizen armies, could not but reinforce the effects that the size of armies in itself produced upon fortification. With such a tendency on both sides, the initial deployment on each side would inevitably be carried out, wholly or largely, in accordance with an *a priori* plan of battle. Strategic considerations for the side which had chosen the pure offensive and moral and political considerations for the side which had chosen the defensive-offensive, imposed concentration close up to the frontier, in the first case so as to seize the initiative, and in the second so as to surrender as little of the national territory and resources as possible. Frontier fortification therefore had as its first duty protection of a line or zone of railheads close behind it; and since railway communication is in principle highly sensitive, a system of ring-fortresses at intervals could not give the same protection against sudden raids as linear defences of equal trench-length. But there was a further consideration. An *a priori* scheme of battle, with frontage and not depth as its main characteristic, is liable to require considerable modification when contact has been made and the first serious combats have produced their varied results, and thus a regrouping process begins in the course of the operation itself. In this regrouping, fortification is called on not only to protect the lateral shifting of masses by rail (as for instance the moves of the French IX. and XVIII. Corps from eastern Lorraine to the Ardennes in the middle of Aug. 1914), but also to send away its own local reserves to the area of decision (as in the case of the three French divisions transferred from the Meuse-line front to the Somme at the end of Aug. 1914).

The more penetrable the country, the more pronounced the linear character of the fortifications that must cover it. Not knowing the direction of attack, the defender must either prepare for it at all points of his allotted frontage of influence, or else resign himself to giving up country that *ex hypothesi* is economically valuable, and manoeuvre in retreat to gain time. The old policy of devastating a deep zone to cover manoeuvre, occasionally practicable when the organization of the state was simple and predominantly agricultural, is almost or wholly inapplicable in an industrial country. In Oct.-Nov. 1914 Hindenburg devastated part of W. Poland as cover for a lateral regrouping. But when it came to including Upper Silesia in the devastation programme, industrial influences promptly intervened to mitigate it. The

<sup>1</sup> In the event Paris played the part, originally assigned to Laon-La Fère, of end-redoubt in the battle-system. Antwerp, after capture, was organized by the Germans for the same purpose, viz. to serve as end-redoubt to the Antwerp-Meuse line.

expedient of making even a narrow zone truly impenetrable by means of radical destructions, adopted by the Germans in France in the spring of 1917, requires both time and an elaborate labour programme, neither of which is available in a battle crisis. In some cases, inundations serve the purpose, but even inundations take time to spread. On the Yser front in Oct. 1914, five days elapsed between the order to open the sluices and the creation of an effective barrier thereby. Moreover, in a generally penetrable country the area of decision might turn out to lie in an unexpected direction, and, if so, a system of fortifications designed to protect regrouping by likely lateral routes might prove to be useless for covering those which actually were required to be used. Thus, a speculative element began to come into schemes of fortification. It was no longer possible to justify heavy capital expenditure on works by reference to plain and definite needs. Already it was admitted that if the unexpected happened, it would be necessary to make shift with improvised works; already a considerable body of opinion held that permanent works, if admitted at all, should be similar in general design to field works; and the tendency in these circumstances was inevitably to trust to the latter, which were cheaper, could be built just where they were wanted, and according to many experts were just as good in principle as permanent works, and indeed better than most of the expensive fortifications already in existence.

This underground growth of the linear principle was fostered by another cause. The time-honoured relation of the town and its defences was altered. Under the influence of tradition theory continued to conceive of the fortress as a circular defence round a town. But the town had ceased to interest the military engineer, who now called it the "nucleus." He disposed his ring of defences at such a distance as to protect the nucleus from bombardment, a convention which was imposing a larger and larger perimeter with every improvement in the range of guns, but his works were now meant primarily to take a share in the operations in the field. That being so, except in such cases as that of Port Arthur, where the nucleus contained establishments regarded as essential to the conduct of the war, it was almost a matter of indifference whether a particular town should be protected or not. The old relation of the town and its walls had been based on the fact that the walls preserved the town from pillage and murder. In the course of time this had changed to a great extent, and in the era of "cabinet wars" it had almost vanished. But the old mediaeval spirit of the towns came to life again in such instances as Zaragoza, Colberg, Venice, and even if the towns-people were indifferent or sullen, the governor could usually resist pressure from them, because he was strong in the conception of his plain duty as a soldier to defend the post entrusted to him. But when the defence perimeter had advanced out of sight of the town, and the *enceinte* had either been turned into a public garden or retained, demilitarized, as a historical monument only; when, further, in peace-time no military barrier whatever differentiated the defended area from the open country; when, lastly, two generations of railway traffic had destroyed the self-centred economic life of the town and blurred its particularism—then from the point of view of the town it was in much the same position as any undefended town or village in the theatre of war. It might come within the ambit of military operations or it might not; if it did, it might either resist the invader heroically in the manner of Belfort in 1870-1, or agitate for demilitarization as Lille did in 1914, but the fact that a ring of forts lay out in the country around it had very little influence either way on its conduct as a town. Open towns in modern times have behaved like fortresses of old, and fortresses like open towns of old.

Correspondingly, the position and outlook of the governor had changed. Formerly the town was his charge, and almost his viceroyalty. His troops were his own; organized for sedentary warfare and not for campaigning, they were not at the disposal of a field army which happened to be operating in the neighbourhood, and the town was in practice defended—sometimes with spirit, sometimes feebly—whatever course operations took outside. Up to the very eve of the World War a French fortress governor was responsible to the Government only, and took no

orders from the commander-in-chief of the field armies. The era of "cabinet wars" made little difference to this state of things; the population might be indifferent to the war in the towns as in the country, but to the governor and his troops the fortress was still a charge to be defended. Moreover, it was a real base for the armies in the field, in that the stores and supplies for those armies were accumulated in the fortress, and a real strategic aid in that it commanded routes that were obligatory for both sides. But when, in our own times, the governor had become simply the commander of a certain group of forces destined like other forces to take their part in a general scheme of battle; when the area within his defences had to a great extent ceased to be the source of stores and supplies for the field army, and when railways, needing protection at all points and not merely at a focus, became the principal lines of communication, the choice between evacuation and defence came to be governed by larger considerations of strategy. The governor's decisions therefore were assimilated in principle to those of any tactical executant of the strategist's instructions. He might defend or evacuate as a field commander might hold his ground or retire. But the peculiar character of his responsibility was gone. Even in France, the country which has been most tenacious of the fortress tradition, the old regulation, already quoted, was modified in the 1913 "Regulations for the conduct of Higher Formations," which empowered the commander-in-chief to assume control of any fortress and its forces if he thought fit.<sup>1</sup>

On the German side, units made up from fortress garrisons formed quite one-third of the Eastern armies during the first campaigns of 1914 operating sometimes a hundred miles away from their fortress of origin and in the sequel, never returning to it.

In sum, therefore, causes of a general character operating before 1914 produced these tendencies: (a) to divorce fortifications from their nucleus or central town, (b) to make them rather linear than circular in trace, (c) to bring them into conformity with the battle-scheme of the field armies (with *déclassement* as the alternative), and (d) to construct them as far as possible according to the principles of field fortification.

The theory of fortification, on the other hand, was still bound by the notion of a nucleus, and unable, therefore, for the moment to employ its stock of ideas and methods to the best advantage. The practical technique of fortification and siegcraft was, meantime, progressing in details; reinforced concrete had come into normal use, armour was improving in quality, the defence had it in its power no less than the attack to profit by developments in the design of quick-firing guns and howitzers of medium calibres. Observation balloons and kites were available, superior to the old spherical types; wireless telegraphy removed some of the dangers of investment and made it possible to co-ordinate the activity of a besieged garrison with that of a relieving army. The technique of bored mines developed, and trench-mortars and grenades reappeared. The lessons of Port Arthur in matters of detail-tactics and design were assimilated in the various armies. The enormous defensive power of the machine-gun was realized and to some extent exploited. It remained to synthesize the application of these elements, old and new, in an art of fortification that responded to the new demands and conditions of warfare.

This art began to take shape with the introduction of the "group" principle. Advocated by several theoretical writers in the period of controversy, it was applied practically, and on a large scale, by the Germans in the celebrated *Feste* constructed on the Moselle and the Rhine in the last ten years before the

<sup>1</sup> It was in virtue of this new regulation that Galliéni's Paris forces were brought under Joffre's command in the battle of the Marne; and in accordance with the spirit of it that Sarrai acted in the same crisis, when, although only an army commander, he sent imperative orders to the governor of Verdun to despatch his mobile reserves to the battle-field of Revigny. The fact that the governor, General Coutanceau, though himself under attack, complied with this requisition instead of standing on his undoubted legal rights, is itself evidence of the changed outlook of the fortress governor in modern warfare. In a somewhat different way, the confused story of the *déclassement* of Lille in Aug. 1914 points the same moral.

World War. They may be considered from two points of view: locally, as examples of a type of fortification, and collectively as a defensive ensemble.

The *Feste*, as its name indicates, is rather a self-contained fortress on a smaller scale than a fort in the old sense. Although it forms with other such works, and with forts or batteries, part of a defensive system which as a whole may be either linear or circular, it contains within its own wire entanglements each of the elements of defence—artillery for counter-battery, artillery for flanking the intervals, and infantry works for the protection of this artillery against a close attack. But it combines them in a way which differentiates it in principle from the types of fortification characteristic of the 1873-1903 epoch.

In that period there were, broadly, two opposed schools of thought, and a school of compromise. One school, fairly perhaps designated as the French, favoured an arrangement in which the "forts" form the close-defence element and intermediate battery-positions the distant-defence element. The opposite, or Brialmont school, exemplified in the Liège and Namur works (see to 60.8-9 for plans), relied on a simple ring of powerful self-contained forts, each including both these elements. Variations within the respective schools turned chiefly on the use or non-use of armour, some relying upon it for the protection of all defensive weapons, others confining it to the close-defence weapons and yet others excluding it altogether. The compromise school, favoured by Austrian opinion, sought to modify the characters of each type so as to combine them. In all cases, it should be added, the intervals were intended to be garnished in war with an improvised trench system, with its wire, its dugouts, and its machine-gun emplacements.

The *Feste*, on the contrary, attempts to combine the two elements of defence without modifying either. Full security for the long-range elements is given in principle by dispersing them, equally full security for the close-defence armament by concentration within an obstacle. To add positive or negative protection, armour is introduced wherever necessary, and loose and "provisional" as the forms may seem to the student of earlier fortification, it must not be forgotten that, structurally, every detail of the *Feste* is a piece of permanent work.

This very warning, however, suggests that it is necessary—more necessary than ever—for the student of fortification, whether practical or theoretical, to find a satisfactory answer to the question: What is it exactly that we require of "permanent" fortification in the tactical sphere?

The rôle of permanent fortification, it is suggested, is to give to the garrison or defence force a greater degree of security, and to its armament better conditions of employment, than "provisional," *i.e.* heavy field, fortification can give.

To prevent the enemy's guns from obliterating the defences of the front attacked, and thus enabling his infantry to make its way into the defended area, these guns must be counter-battered and (if possible) destroyed, but in any case neutralized as far as practicable. This implies a counter-battery armament on the side of the defence. According as the guns of this armament are exposed to enemy observation or not, they require, or they can dispense with, fighting protection. But in both cases, and especially in the second, they require to be screened against hostile raids or brusque infantry assaults that may develop during this counter-battery phase, emerging perhaps from dead ground close in front.

This protection can be given in the form of an obstacle to the enemy's passage, so serious that a great and organized effort is necessary to reduce it. Such an obstacle may be a deep ditch, or a system of wire entanglements or grilles, or both. Normally, the former is the better obstacle, but except in country already intersected with canals, wet ditches, river-channels, the use of a ditch requires that the armament to be protected shall be grouped very closely. Unless, therefore, the engineer and his Government are prepared to face the expense and provide cover of the solidest kind<sup>1</sup> the ditch as obstacle is usually excluded, so far as concerns

the protection of what may be called the main armament. The wire or grille, as compared with the ditch, is greatly inferior as an obstacle, but much more readily created, more easily destroyed, but more easily repaired also. Obstacles can be traversed, either after being broken down by bombardment in advance of the assault or by means of scaling ladders and bridges accompanying it. As against destruction by bombardment in advance, the only remedy of the defence is the counter-battery which entirely or partially stops the bombarding guns. But even without such destruction, the obstacle may be overcome by ladders and bridges, wire cutters, petards and other appropriate means, in the course of the assault itself, unless the work of placing these devices is made impossible by the defenders' fire. Hence the obstacle, whether it be ditch or wire, must be protected by a close-defence armament, and nowadays it is generally admitted that this armament must be a specialized organ. But how is this in its turn to be protected against destruction or neutralization at the critical moment? Practically by its own defensive arrangements alone. And thus, in the element designed to guard the obstacle, we reach the alternate unit of fortification upon which the whole system depends, that which in the last analysis ensures for the main armament the power of undisturbed counter-battery (in the case of a *fort d'arrêt* of keeping the forbidden area under steady fire).

The close-defence organ, then, has two functions—to protect other elements and to protect itself. The former presents no particular difficulty, and is merely a question of providing the necessary fire-power. But the latter is the critical problem of modern fortification.

If the counter-battery guns are concentrated, as in a fort, and the obstacle is a ditch, then—quite apart from the material cover required for these guns to enable them to fight—material cover is also needed for the close-defence organ, since its position is practically obligatory. But the cover is obtained relatively easily since the weapons covered are sunk to the level of the ditch-floor, and any necessary thickness of protection can be provided over it both on first construction and later.

But such a concentration of counter-battery methods creates large intervals between work and work, and access to the defended area (which with a dispersed main armament is automatically barred by the obstacles defending this and the fire of the organ which protects them) must be prevented by organs in the works so placed as to control the open zone. In some systems reliance has been placed on the counter-battery guns themselves to do this, but modern engineer opinion generally may be said to be opposed to this, since guns which have been engaged in the artillery duel may have been put out of action by the time that they are wanted for close-defence, and even if intact should be wholly absorbed in their proper task. The organ providing ditch defence, by reason of its situation is not as a rule able to undertake control of the open intervals; and in short the only alternatives are small cupolas or *traditore* batteries. The former are open to many objections. If built into the same work as the main armament they are almost as much exposed to premature destruction as the latter is<sup>2</sup> and must be provided with fighting protection on the same scale. If mobile, they are exceedingly costly in proportion to the fire-power they develop. For these reasons modern practice generally favours the *traditore* battery, which is a casemated emplacement (sometimes a cupola) at or near ground level, giving fire only to the flanks and rear of the work, situated in the rear portion of it and protected against bombardment to a great extent by the mass of the work itself.

But, from the nature of its duty, the site of the *traditore* battery is frequently obligatory, and when it is combined inside the same obstacle with a concentrated counter-battery armament, the needs of the latter as to site may conflict with those of the *traditore*. In the avoidance of this, perhaps more than in any other

<sup>1</sup> As Col. J. C. Matheson has pointed out, the closer the grouping the denser the material required to protect it.

<sup>2</sup> The cupolas of this class in the Antwerp forts suffered nearly as severely as those of the main armament, although they were hardly called upon to exercise their special functions, since the infantry attack of the Germans was not pressed into the intervals before the fire of the forts had been beaten down.

single factor, lies the central idea of group-fortification of the *Feste* type. Two dissimilar elements have to be both protected by the same obstacle and yet spaced some distance apart. But the obstacle (in such conditions mainly wire or grille) itself requires local close-defence. This "ultimate unit" has thus not yet been arrived at. Nevertheless, this ultimate unit, in group-fortification, has only to give short-range protection to the obstacle, and in practice it is an infantry-manned stronghold, designed to give fighting protection to its garrison,<sup>1</sup> sometimes provided for, its own local safety with a deep ditch and sunken flanking defences, sometimes organized with a fighting parapet frontally commanding an artificial foreground which is wired, but always having as its real function the protection of an obstacle external to itself.

In the case of concentrated main armament, therefore, it would seem that fighting protection for the counter-battery guns, for the *tradiore* batteries, and for sunk ditch defences is required to be designed on such a scale as will enable these elements to defy, actively or passively, the attack guns of the day and the morrow. The same applies to the shelters in which—in the case of group fortification—the garrison of the infantry work is placed in readiness to man the parapets, but not necessarily to these parapets themselves. Further, in proportion as wire replaces the deep ditch, as an obstacle, heavy and expensive work in peace-time is dispensed with.

In the system of deployed main armament, on the other hand, the proportion of permanent work, it would seem, can safely be much less. With modern artillery means, the sites for counter-battery armament are rarely obligatory; observation must be provided for; but the actual position of the guns, and therefore the line of liaison between observation post and guns, are—to a great extent at least—free from limitations of ground. This being so, the close-defence element of the fortifications may be disposed to the best advantage for carrying out its task—that of protecting a system of obstacles suitably placed between the battery zone and the enemy.

In point of permanent work, then, although parts of the battery positions themselves may occasionally require concrete or even armour, concealment of virgin earth, and alternative positions in the great majority of cases afford all necessary protection. For the close-defence guns, on the other hand—the element which must be able to endure at all costs—the chosen positions are often (if not in most cases) obligatory, and full-scale fighting protection must be given. Even so, there being by hypothesis, no necessity to develop frontal fire, and the volume of the required lateral protective fire being relatively little, a permanent work which is essentially a *tradiore* battery and nothing else can be both small and well-covered against frontal fire at an expense much less than that of a great self-contained fort. Its own local protection may be either a ditch with sunk defences or an infantry system surrounded by wire, but these auxiliaries, too, would be withdrawn from the crest facing the enemy to positions on the reverse slope. The only case in which it would be necessary for any part of the system to go forward to the crest and front slope would be that in which the artillery observation and command post is combined with the *tradiore* in one work or one enclosed group. In such a case the post in question would undoubtedly require special treatment as regards its own close-defence. But all that in principle is necessary is that the post and its liaisons should be immune.

On the other hand, the security of the main armament against a rush of hostile infantry was far greater when an obstacle defended by fire completely surrounded it, and military engineers were very loth to impair this security. No doubt, when the obstacle covering the front of the batteries in the deployed order was fully organized, the latter might be considered safe enough for practical purposes so long as the interval-defence remained effectively in action to protect it. But a danger period was foreseen in which the obstacle was not yet fit to perform its function with certainty. The "brusque" or (more accurately) the "abbreviated

attack," proposed by the Bavarian General von Sauer, had many supporters; and as the tendency already mentioned, of modern warfare between "armed nations" is to push the line of resistance as nearly up to the frontier as possible, the fortifications of that line were in fact exposed to instant attack.<sup>2</sup> Those of Verdun and Toul were little more than 20 m., the easternmost fort of Liège only 13 m., from the German frontier, while the western Metz forts could be bombarded from French soil. In former days, this would have mattered less, but the growing mobility of heavy artillery—from about 1890—for the first time made it possible to employ true siege artillery within a few hours of the opening of hostilities. The attacker, on the other hand, naturally had to forego some of the power of his attacking means in attempting a *coup*. His truly mobile siege artillery was limited, or supposed to be limited, to the calibre of 21 cm. Heavier pieces though they no longer took weeks or months to arrive in their emplacements, at any rate took days to do so, and by a sort of general agreement (to which however there were exceptions) the situation was met by placing a part of the main armament of the defence—called the safety armament—inside a closed obstacle. Usually it was an existing fort that was adapted to house the safety armament, but sometimes it was included in the design of a new work. The fort thus in practice reverted partially to its old duty of serving as a battery position, while in theory its function had become entirely that of locally protecting a *tradiore* or other interval defence. The distinction between property and accident was no doubt clear to specialists, but the result was that the generality of armies and peoples continued to look upon a fort as their fathers had looked upon it, till the astonishing events of Aug., Sept. and Oct. 1914 so thoroughly undeceived them—too thoroughly, indeed, for in the revulsion, not merely safety-armament guns but even interval-flanking guns were removed from closed works.

In the system of group-fortification, it was naturally much easier to house a safety armament. No element within the ring of wire need cramp any other, or be drawn into the fighting activity of another, or suffer from the shells intended for another.<sup>3</sup> Full fighting protection will be necessary, as is always the case with safety armaments, but, as has been noted above, with more room the same safety can be given with less expense.

In sum, therefore, the necessity of compromise on this question of safety armament has caused the dispersed-elements and the concentrated-elements schools to agree upon: (a) the group or *Feste* principle for interval-flanking elements, obstacles and defence of the same, and safety portion of main armament; (b) the order principle of deployed artillery, with an obstacle covered by flanking fire, for the remainder of the main armament. This, it will be noted, leaves a real liberty for the treatment of particular cases. The proportion of total armament installed as "safety" is whatever the designer chooses to make it in each instance, the *Feste* being adaptable to any proportioning within reasonable limits fixed by the contour of the ground. A practical check on enclosing an unnecessarily high proportion will always be the expense of giving full fighting protection.

*Examples of Group-Fortification.*—Types of forts, both main armament forts and others, being described and illustrated in 10.696,

<sup>2</sup> To wire a perimeter or frontage of 30 km. to a depth of eight yd. only requires three eight-hour shifts of (in round numbers) 6,000 workers each, as well as mechanical, animal or human transport for about 4,000,000 yd. of barbed wire, weighing 300 tons or so, and 100,000-130,000 stout posts. Other work to be done includes the clearance of the field of fire, the digging of trenches, the construction of shelters (if not in existence already), opening of communications and liaisons, etc. Land which is occupied by a fortress garrison in war rarely belongs to the Government in peace.

<sup>3</sup> This can be demonstrated by the "theory of probabilities." Assume a main-armament cupola 16 ft. in diameter, under accurate attack by a gun having a probable error of 60 ft. in range and 3 ft. in line. Calculation shows that it will probably be hit by 7% of the shots fired. Now assume a *tradiore* element having a vulnerable surface on top of 20 ft. from front to rear and 25 ft. laterally. Placed with its front edge 120 ft. behind the centre of the cupola, this will receive 3.62% of the shots aimed at the latter. Placed with the front edge 240 ft. behind, it will be hit by 0.2% of the shots. In other words, at twice the distance it is eighteen times as safe.

<sup>1</sup> The term "storm-proof," frequently applied to such infantry works, hardly seems to connote their real function.

it is only necessary here to consider examples of the newer group-fortification. Three forms may be taken, one of which, the Metz form, has been applied on a large scale, while the others, though academic examples, are fully representative of principle.

Common to all, it will be seen, are: (a) a wire obstacle round the whole group, and behind it an infantry trench-position; (b) very large area, equalling that of town and fortifications together in some of the old Vauban fortresses, and six to eight times that of the typical 1873-1903 fort; (c) batteries, closed and under armour, for the guns of the main armament (or safety armament) irregularly disposed within the wired area.

So far, all are in agreement. But beyond, there are some important differences. Thus, the Metz group, and those proposed by de Mondesir, both possess powerful infantry works with ditches, whereas the Austrian type lacks this element. Again, de Mondesir and the Austrian text-books agree in attaching the greatest importance to the *tradirore* element, remarkably neglected in the Metz works—at least as originally built. Lastly, the Austrian and German engineers tend to place the centre of gravity of the artillery, and even that of the infantry, defence well forward, while the French author puts them as far back as possible, with only observatories and frontal trenches in the forepart of the area.

The Austrian design (fig. 1) as the simplest, is taken first. On the height 130 is an armoured battery P B, containing four 6-in. howitzers in cupolas, with an observation post in a small cupola in the centre.<sup>1</sup> Between the cupolas are magazines for the storage of 800 rounds per gun. A passage runs along the backs of the cupolas and ammunition rooms, and two barrack rooms are provided at the ends, with other small rooms as offices, etc., in the centre. In the actual design the thickness of the concrete is, in places, less than 2 metres, which is considerably below present-day standards.

On the forward slopes at S, S, S, are small works, combining in each 2 cupolas for quick-firing guns (intended for frontal close-defence, not main-armament work), with an armoured observation post between them and a shelter for infantry and machine-guns in waiting, to man the trench-line against assault. These are built with a roof of about the same thickness as that of the main-armament battery. On the rear slopes are two powerful *tradirore* batter-

FIG. 1.—Austrian Type

ies, T T with quick-firing guns (4 to 6 in each, in order to have sufficient for a distributed fire over the interval, in case fog or darkness makes accurate aim impossible). The inner parts of the concrete masses are organized as barracks (U) and magazines. The *tradirore* is in two tiers, the upper commanding the country outside and the lower sweeping the (wired) bottom of the ditch. Armour is used for the faces of the gun casemates and nearly 3 metres of concrete form the roof. Those parts of the wired ditch not swept by the *tradirores* are flanked by counterscarp casemates (F F) containing machine-guns or pom-poms and protected by 2.8 metres of concrete. Tunnels connect the various elements of the group. In this design, which is simple and, owing to the absence of refinements that would not stand bombardment, strong, there are nevertheless some points of weakness, which may be discussed here, not by way of criticism but because they afford convenient illustrations of certain practical points which the engineer cannot ignore.

The whole of the front work depends for its intimate flanking upon the counterscarp casemates, F F. In such cases it is necessary to protect the backs of the casemates and their communicating galleries from mine attack, by providing the roots of a counter-mine system at the outset. This was a form of attack which played a considerable rôle at Port Arthur. It is perhaps the only way of

dealing with counterscarp casemates, but it is an effective one. At Fort Vaux (Verdun) the Germans made their way through a counterscarp casemate into the tunnel system of the fort, and the terrible gallery fighting of Port Arthur repeated itself. But, unlike the Japanese, the Germans had no difficulty in gaining access to the galleries in the first instance, as the French had themselves blown away the backs of the casemates in order to get convenient access to some external trenches. It is noteworthy that in the final stages of re-fortifying Metz on the group principle, the Germans were careful to provide the foundations of counter-mine systems. In the Austrian design here considered, nothing prevents the development of mine attack on these casemates except the fire of the central battery P B and the batteries, S, S, S, all of which are exposed and liable to neutralization or destruction by counter-battery. The depth of the ditch containing the main wire varies, and no walls exist to make it an important obstacle in itself. The integrity of the obstacle therefore depends purely on the fire of the counterscarp casemates, and—quite apart from the question of mining attack on these—later war experience has shown that there is great risk of the flanking fire being impeded or intercepted by the debris produced by intensive bombardment. This weakness is common to all ditches, and the problem of keeping the field of fire open had not yet been solved in 1921. But it is evident that the longer the ditch, the more chance there is of a heap of debris collecting at some point in it. In any case, it would seem that to attempt ditch protection for the whole perimeter of a group work involves the expenditure of money that might more profitably be devoted to other elements of defence. Another defect seems to be the small number of the infantry shelters, having regard to the time required for the defending infantry to come out and man the parapet. This is the more important, as this design altogether lacks the strong self-contained infantry work which is the kernel of those now to be described. The evolution of Metz as a ring-fortress is dealt with at 10-696. Allusion is there made to new works in progress outside the existing perimeter. These were the famous *Feste*. They were built in succession from 1899 to the outbreak of the World War, and were continued and practically completed in 1915. Their characteristics were only approximately known at that time, but when Metz was retroceded to France by the Treaty of Versailles, not only their present condition, but their history and cost accounts became available. (See the French official *Revue du Génie* of Jan.-Feb. 1921.)

The *Feste* in fig. 2 (from the *Revue du Génie*) shows an actual example. It should be understood that the Germans designed the earlier works of this class with a minimum of defensive precautions, notably in respect of external flanking, but that, in the later works constructed in the two or three years prior to the World War, there was a marked tendency to develop the hitherto inadequate external flanking, even at the expense of the main armament, which on this line of evolution would, in due course, have become a "safety" armament only. The group-work illustrated is rather of the earlier than of the later kind, as it is lacking in the *tradirore* element. But it is one of the greatest advantages of the group-work over the cramped fort that additions and alterations can be made as required, and in fact many such works at Metz were provided later with 57-mm. and 77-mm. *tradirore* batteries.

The *Feste* forms an irregular quadrilateral, measuring, from outer edge to outer edge of wire, 1,200 yd. from front to rear and the same from flank to flank, with an area within the outermost wire of about 120 acres. At the front and rear angles there are strong and minutely organized infantry works, which form the basic units of the system: their rôle is to flank the wired perimeter and to look after their own close-defence as well. At the right and left angles, the perimeter trench takes the form of redoubts, which contain, in their forward sides, infantry observation posts, and, in their rear sides, both observation posts and organs for flanking the rearward wire. In the interior of the *Feste*, four armoured batteries for main armament are disposed irregularly and each has a war barracks attached, communicating with it by underground passages. The perimeter trench is provided at intervals with armoured sentry posts. The artillery observatories are aligned on the front slope, and have tunnel connexions with their batteries. The fifth battery is a dummy—a device freely used in these Metz works, in which there is plenty of room. The perimeter wire is sunk to a depth of 2 metres, and the ground in which it is bedded is sloped up to the infantry line, which has the lowest command compatible with its functions. This perimeter wire is carried round the main works (01, 02) also (though partly unflanked), but the strength of these lies in their inner system. Behind the perimeter wire and the advanced parapet or covered way lies a deep ditch (20 ft.), wired at the bottom and provided with a concrete counterscarp. The floor of this ditch is flanked (in the case of the forward work 01) by a double counterscarp casemate at the apex and a small *caponnière* in the gorge.

About the same time as these Metz works were being evolved in Germany, Lt.-Col. (afterwards General) Piarron de Mondesir, in France, advocated another type of group-fortification, which, though generally of the same class as the *Feste*, shows some characteristic differences.

De Mondesir's group is in general outline oval, or rather lens-shaped, with the curved front towards the enemy and the flattened front towards the defended region. Like the *Feste* it bestrides the

<sup>1</sup> This is a miniature of the gun cupola, with a telescope placed in this port. The development of the periscope now makes the provision of protected command ports much easier than it was at the time of this design.

natural crest. Immediately beside the main wire is a continuous infantry parapet, which has at frequent intervals concrete shelters for machine-guns as well as infantry. On the natural crest, a central structure of concrete and armour contains the commanding officer's observation post and two machine-guns in cupolas for the direct

batteries," was destined to survive and multiply in the World War. The rear defence of the inner system is provided by the rear portion of the perimeter trench, with its concrete machine-gun shelters and its wire.

The most marked characteristic of this design is the fact that the interior space of the "group" is organized principally for step-by-step close-defence, whereas it is utilized in a *Feste* for battery sites. The middle foreground is under the fire of two quick-firing guns in cupolas, but the author of the system evidently does not trust to these organs overmuch, for he arranges that they shall be fired into and destroyed by the main-ammunition guns if captured. The essential element of the first stage of close-defence is the machine-gun detachments in the front trench, which are housed under concrete till the moment of action. The second stage, which begins when the assault has broken into the front trench, is a combination of counter-attack from the great shelters behind the crest with machine-gun fire from the central crest cupolas; to facilitate this counter-attack, the back of the front trench is smoothed to glacis-form. When all this is lost, the inner system with its "infantry batteries" sited well down the reverse slope, has still to be carried before the main-ammunition or *traditore* batteries can be reached, and the machine-gun cupolas of the keep not only cooperate in this third stage, but (with the blockhouses attended to earlier) make it difficult for the enemy to make a lodgment even in the fourth and last stage. In all stages after the first, the curved fire of the trench-mortar battery plays a part. In this respect, and in the free use of machine-guns and local counter-attack, de Mondesir's fortification anticipated by ten years or more the trench-warfare methods that developed in the World War.

The above outline account of applications, practical and theoretical, of the new "group" principle requires the addition of a few details as to the principal constituent elements of such works,—the counterscarp casemate or *caponnière* for low-flanking of a ditch, the main-ammunition or safety-ammunition battery made up of cupolas (as distinct from the cupolas themselves), and the *traditore* battery.

The Austrian counterscarp casemate, illustrated in fig. 4, is constructionally a simple example. Under the counterscarp wall, on the further side of the ditch, facing the salient angle of the work, a chamber is formed with embrasures for rifle, machine-gun or light-artillery fire along the two adjacent ditch lengths. In this case armour is used for the embrasures, each gun-room (K K) having two very light guns or pom-poms. B is a living room for the squads assigned to the defence, A a latrine, St a stairway leading to P, a concrete tunnel under the ditch which communicates with the body of the work.

Fig. 5 shows a counterscarp casemate of more advanced type. It is amongst the most modern examples of such structures, forming part of a 1914 work at Metz. It fires in one direction only. The inner portion of its mass is in ordinary, the outer in reinforced concrete, and the total thickness is 3 metres. Fire is arranged in two tiers, for rifles, and for machine-guns, and one embrasure (the safest) is allotted to a searchlight. The details are worthy of close attention. The top of the wall is formed as an overhang, under which the fronts of the fighting chambers are recessed. This gives enhanced protection from fire, and also from the risk of grenades

FIG. 2.—Plan of a Metz *Feste*. sweeping of the foreground, and towards the flanks two somewhat similar structures house each a 75-mm. Q.F. gun, its observation post, and the observation post of one of the main armament batteries mentioned below. Just behind the crest are two large battle-

FIG. 3.—Section of infantry work o1 of fig. 2, on line a-b.

shelters in concrete for counter-attack infantry. Then, well back, comes an inner system forming a still flatter "lens." This contains the main armament batteries, the *traditore* element, and the infantry keep. Its front wire traverses the whole interior of the group, leaving the crest elements and counter-attack shelters outside it, and resting its flanks on the infantry parapet, the junction being sealed by blockhouses. Within this wire, which is protected frontally by several "infantry batteries," i.e. loopheaded steel screens or pent-houses for riflemen, lie, towards the flanks, two batteries of main armament artillery in cupolas and one or two "Bourges casemates"—genuine *traditore* batteries which can only fire to the flank and rear and are heavily protected and masked towards the front. Centrally placed between the artillery positions is the infantry keep, in this case as in the German the basis unit. It is four-sided and has a deep wired ditch which is flanked not by counterscarp casemates, but by two low *caponnières* springing from the base of the escarp at the diagonal angles. In the concrete of this keep are the war barracks of the whole garrison, observation cupolas, and at least two machine-gun cupolas which are in fact the essential defence of the keep. Embryonic counter-mine systems are provided at the salients of the keep. Behind the keep is a battery for small short-range mortars—a novelty which, unlike the present writer's "infantry

being thrown in by an assailant overhead. At the foot of the wall is a pit which lowers the floor of the ditch so far that the assailant in the ditch cannot reach the embrasure. This pit also serves to take debris that might otherwise mask the fire of the lower tier. A gallery formed in the mass of the counterscarp connects the casemates of the different angles.

An example of the modern counterscarp is shown in fig. 6 from another Metz work. Here it will be noticed that, for defence and also for ventilation, the gallery possesses a loophole. Over this is a grille to prevent the placing of scaling-ladders and the upper part of the counterscarp wall is formed to a peculiar section which gives a minimum foothold to an assailant scrambling down, and presents an unfavourable striking angle to all projectiles.

The Mass—for it is a mass rather than a wall—is 7 metres thick for 7 metres of height. The communication tunnel between such a gallery and the body of the work (fig. 7) gives 2 metres of (ordinary and reinforced) concrete protection besides that afforded by the earth of the ditch floor.

Some designers, owing to the risk of the backs of counterscarp chambers and galleries being breached by mining, or the communicating tunnel destroyed from above or below, prefer to keep the ditch between the enemy and the flanking organ. In this case a

low *caponnière* is built out into the ditch from the escarp or from the mass of the work; in the work of fig. 2 the ends of the two-story concrete barrack are arranged to act as *caponnières*.

FIG. 4

An unusual flanking organ designed for Metz is shown in fig. 8. Here the difficulty of giving sufficiently thick protection for an organ flanking wire at or near ground level (e.g. the outer wire of a *Feste*) is met by providing a sort of detached *caponnière* in the form of a low, fixed, armour-structure bedded in concrete, the guard-room, etc., being formed in the mass of the latter. It is intended for rifle and pistol fire through loopholes, and like all modern German flanking organs it has a small searchlight.

A battery for main armament is substantially an assemblage of two to four individual gun or howitzer cupolas in line within one mass of concrete, with the space available between and behind cupolas formed into expense-magazines, shell-rooms, duty men's rooms, offices, etc. Being as

FIG. 5.—Counterscarp Casemates.

a rule dispersed over the open ground comprised in the "group" they require subterranean communications with each other and with their observation posts. The latter are sometimes included in the same concrete mass with the gun cupolas, but it is more usual to withdraw the battery mass behind the crest and to push the observatory forward. Batteries are often wired in, and sometimes given means of local protection against surprise attack. They contain not only a large stock of ammunition, but also, nowadays, laboratories and workshops.

FIG. 6.—Counterscarp from Metz.

*Traditore* batteries, by hypothesis, fire only to the flank and rear. They are thus always placed, so to say, behind a corner; that is, protection is accumulated in front of the gun casemates, and this protection is continued laterally for such a distance that a projectile from any likely direction will either meet the covering mass or pass clear of the gun muzzles. The original form is that designed in France and known as the "Bourges casemate" (fig. 9) from de Mondesir's *Fortification Cuirassée*.

FIG. 7.—Communication Tunnel to Counterscarp.

A larger *traditore* of Austrian design is shown in fig. 10. This is formed in the end of a concrete mass of which the remainder contains the war barracks, storehouses, etc. The lower embrasures flank the floor of the fort ditch, the upper—the real *traditore* battery—sweep the flanks and rear of the external intervals. (T T are the gun casemates; B St is the post of the officer controlling the fire; M M the ammunition room; G S a small flanking element to control the ditch just under the *traditore*.) Armour is used to reduce the thickness of concrete, both vertically and horizontally.

The gun usually employed in *traditore* batteries is a field gun of about 75-mm., or a gun of the small naval or tank class, 57-mm., being the commonest calibre. Pompoms (1-pdr. Maxims) and even machine-guns are also found, but as a rule it is the field artillery type of effect that is required and provided for. Cupolas are sometimes, but rarely, employed, as their characteristic virtue of all-round fire is not wanted.

*Administrative Arrangements.*—Any work that has to act in isolation, or semi-isolation, is provided with all the necessary "services." Store-rooms, hospitals, barrack-rooms, etc., with all

furniture and equipment, must be formed in the interior of the available concrete masses; water must be laid on, lighting and heating provided for. Though hitherto it has not been thought desirable to provide power for working cupolas, etc., it has already become necessary to include a power-room (dynamos and Diesel engines) in the equipment of the *Feste*.

FIG. 8.—Flanking Organ (Metz).

Amongst these auxiliary arrangements, there is one, however, which during the World War proved to be of predominant importance—ventilation. The fall of the forts of Liège and Antwerp was largely due to the ventilation arrangements proving inadequate. Poisonous fumes from the burst shell penetrated the concrete fissured by its explosion, and filled the underground galleries of the fort, asphyxiating or disabling a large proportion of the already overstrained garrison. In the latter part of the war, the development of gas warfare added a further complication, as it became unsafe to draw in air from outside. The solution adopted by the French for the Verdun forts (which, it should be noted, no longer contained either main-armament or *traditore* artillery, but had become pure close-defence infantry works) was to deliver filtered air from a considerable distance, under slight pressure, to certain rooms in the fort, which were sealed against local air by air-tight doors or otherwise. All men working elsewhere than in these rooms wore gas-masks. Although the group principle of fortification, by dispersing the elements of defence, *ipso facto* dispenses with the subterranean labyrinths of the Belgian forts, and so reduces the effects of explosion fumes, the fact remains that the men in the armoured batteries and the *traditore* and flanking organs, must be protected from gas entering

either by embrasures, cupolas, seatings or fissures, while pure air must be supplied and foul air evacuated somehow. It may be, indeed, that the question of aëration, hitherto subsidiary, will become one directly affecting the fighting design.

*Materials.*—Earth was always the common property of permanent and of field fortification. Before 1914 concrete and armour were reserved for permanent work, but during the World War both came into use for heavy field works as well. Further, as both in permanent and field work care is taken nowadays to disturb the natural earth as little as possible, and tunnelling freely employed, relief being kept down to a minimum, there remain only, as specially characteristic of permanent work, (a) the heavily armoured, deeply-sunk, mechanically highly finished gun-mounting, and (b) the great concrete mass. It is not unreasonable to consider the necessity, or otherwise, of these elements in a fortification scheme as a criterion of the necessity of "permanent fortification," using the words here in the technical sense for fortification of a kind that can only be carried out at leisure in peace conditions.

FIG. 9.—*Traditore* Battery—the Bourges Casemate.

The justification of the elaborate gun-mounting under armour (the cupola, according to present practice) lies in its power to resist, for an indefinite time, counter-battery by the most powerful guns available. That power was tested, during the World War, above all in the case of the Belgian fortresses and at Verdun. The gross results of these two trials were diametrically opposite—the Belgian cupolas failed, usually through the failure of their surroundings but sometimes by their own defect, while the Verdun cupolas held out magnificently. Influenced by the general distrust of permanent work which the Belgian failures had produced, the French had ceased to rely upon their forts for the flanking of the intervals, and the *traditores* had been actually disarmed before the attack of Feb. 21 1916. As this was the principal rôle allotted to the forts, the action of the few distant-defence guns in cupolas (safety-armament) could, *ex hypothesi*, be only a small part of the total artillery defence. But their powers of passive resistance were presumably tested as thoroughly as if they had been the protagonists of the main-armament, and practically none, save some minor cupolas for observation and machine-guns, were disabled at the close of the great siege. Yet they had endured an unexampled bombardment. Fort Vacherauville, for instance, was hit by no less than 2,250 shells, of 28-cm. and above—two such shell for every three square metres of sur-

[illegible]

Even more marked is the discrepancy between the behaviour of concrete at Liège and Antwerp and its behaviour at Verdun; as in the case of armoured gun mountings, the Belgian sieges brought concrete into discredit. Here, however, it is a question of quality of material and of conscientious painstaking work. The best concrete has a resistance such that a test bar will break across the stones rather than the cement; the worst is feebler than virgin earth, especially rooty earth. The Verdun concrete had not only been well made, but had also been given an adequate safety margin of thickness; and it was found that, in spite of the volcanic bombardment, 3 metres of special concrete or 2 metres of reinforced concrete, or 2½ metres of special concrete (or 1.75 metres reinforced) disposed as an apron overlying an old masonry vault, with a sand cushion interposed, would steadily resist calibres up to 42-cm. inclusive. Although the effects of these monster mine-shell were felt in the ground to a depth of 14 metres (nearly 47 feet), the fissuring which had ruined the Belgian forts does not seem to have occurred at Verdun.

In sum, armour and concrete in masses calculated according to the lower standards of a previous epoch, but given a safety

A fixed resistance, *in situ*, of several months, then, is practicable with the materials and means of permanent fortification. That it is not so with those of field fortification is shown by the various trench-warfare offensives of 1916-7. At Verdun the German attack progressed rapidly till it confronted a close-defence system which had permanent works as its backbone. At the Somme, though the Allies' progress was slow, it was sure, and the defense finally evolved a system of "elastic" or "coilspring" resistance, which by its very nature implied the giving-up of ground until an organized counter-attack could be mounted for its recapture. The success of this type of defence, so long as the *moral* of the defending troops, and their skill in group, platoon and company tactics, remain high, is a matter of history. But it is equally a matter of history that there are positions which, strategically or morally, must be defended to the end without yielding ground, on which the defender must say, with Pétain at Verdun, "*On ne passera pas*." And it is for these cases, so far as they can be foreseen in peace, that permanent fortification exists.

Correspondingly, a change follows in ideas as to interval organization. It is evident that, in a ring-fortress of the 1873-1903 type, the individual "forts" occupy only a small proportion

of the perimeter as compared with group-works. The latter, therefore, allow of an extended perimeter for the same admissible intervals. Presently, as we have seen in the case of Metz, the perimeter attains an enormous length, and the ring opens out on the home side, becoming a gigantic redan or salient which comprises a whole region. The standard interval between work and work continues to be honoured at and near the exposed apex, but the gap increases towards the rear till near the root of the salient permanent work may give place to field work and simple utilization of natural obstacles, as in the "Nied position."

In the early 19th century, the ring-fortress was practically an enlarged enceinte-fortress with the curtains omitted. Later, though perimeters increased (in order to prevent bombardment of the "nucleus"), the forts still contain the whole of the main armament and retain responsibility for the defence of the interval against methodical attack. The interval is organized according to the needs of minor tactics, so as to prevent the enemy penetrating to the nucleus by any method but regular, large-scale attack. At the next stage (which is the most important in the evolution of ideas) the main artillery (except the safety-armament) is taken out of the forts and deployed in the intervals, the forts becoming "strong points" on a line of battle which has to protect this artillery. It is this stage which is represented in fig. 11, taken indirectly from a semi-official Russian work of 1913, by Colonels Golyenkin and Yakovliev (which, incidentally, marks the acceptance in Russia, after long opposition, of the principle of armour protection).

FIG. 11.—Russian Fort, close-defence.

The "fort" is a large and elaborate close-defence work designed specially for the sweeping of the intervals by *traditore* batteries, immunity of these being secured by a full equipment of flanked ditches, quick-firing guns under armour and fighting shelters. The arc of fire of the *traditores* is sometimes carried unusually far forward, as it is laid down in principle that special flanking guns, in or out of the fort, must cover the ground from 1,200 yards in front to 700 yards behind the next fort. No part of the main-armament is included in the fort.

From fort to fort, the interval, it is laid down, should not exceed about 4,500 yards. Otherwise, the responsibility placed on the *traditores* is too heavy (the average interval of Verdun, it may be remarked, is only about half this), and closed infantry work (Zw. in the plan) may sometimes be required to command some part of the interval that is not well covered by the forts. Frontally, the interval is held by a number of separate trench-positions formed with glacis foregrounds (V. G.I.) and provided with concrete fighting shelters (U.) and sometimes barracks (J.). Some of these positions have their own light quick-firing guns (Gst.) for flank protection. Four to five hundred yards in rear of this guarded obstacle are armoured batteries (H.P.B., K.P.B.), wired in, which contain the "safety" part of the main-armament with its ammunition. For the rest of the main-armament, battery positions (D.W.) with (M.R.) shelters for detachments on duty (A.U.) and protected barracks for those in waiting (A.K.) are prepared 600-800 yd. behind the front line and connected up as required by trenches. For other batteries, told

off as a mobile reserve, positions are marked out (O.B.). The main magazines of the sector are shown at M.M. and barracks for the third relief of artillery at A.K. in rear.

Apart from the batteries of the safety-armament and occasional foreground-flanking guns not comprised in the forts, peace-time work on the intervals is limited in this example to the construction of fighting shelters, barracks, magazines and the walls of battery positions. But, as soon as permanent work of any sort appears in the intervals, these begin to lose their blankness, and it is a short step to the modern conception of position-warfare—the attack and defence of a long, shallow zone which contains in its forefront the close-defence and in its rear portion the distant-defence elements. In this zone, permanent work will, we may predict, be called upon to perform the services which field and heavy field work cannot perform. It will provide, generally, those of the essentials which cannot be improvised (such as the concreted or armoured infantry, machine-gun and flanking-gun positions, required in the more exposed sites), and in key sections, those which will make the local defence as nearly as possible inexpugnable. And since, as explained earlier, these key sections can be in many or most cases predetermined, whereas the exact position of the rest may vary according to the opponent's plan of campaign, the greater part, if not the whole, of the material protection obtainable with a given expense will tend to be concentrated in them. Thus they may continue to be labelled with the names of towns or other localities as of old. But, essentially, they will be planned in relation to things outside and not to things inside, themselves. They will secure, or deny to the enemy, the use of certain ground or certain communications, definitely and completely. Locally, in order that the close-defence component may fully secure the operation of the distant-defence component, the permanently fortified key section may form a ring, or possess turned-back flanks of considerable length. But in the ensemble, and in many cases even locally, the tendency will be to reduce the depth and increase the frontage of permanent fortifications, so that the works of standard strength which can be built with the available funds may offer the widest direct and positive barrier to an enemy.

**New Weapons in Siegcrafft.**—The evolution, during the World War, of weapons essentially unlike those for which the permanent fortification above-outlined was designed to use and to meet, raises the question—what modifications, if any, do these new weapons impose?

If the conclusion reached above be correct—that permanent fortification has now become, from general causes, the backbone of position-warfare, instead of being a thing apart—it follows that the new weapons will affect it in any case through their influence on position-warfare generally. Were it the case, for instance, that aerial warfare totally superseded land warfare, the ring-fortress might return in a new form as the means of protection of flying bases. But such speculations would serve no useful purpose here, and it is preferable to confine ourselves to the modifications of detail to be expected in permanent fortification as such.

**Chemical Warfare** is a term covering several very different weapons. Smoke which "blankets" the defence organization, gas which disables the defenders, vapour-producers which infect areas, are all tactically dissimilar. The strength of chemical warfare as against fixed defences lies in their fixity, its weakness in the fact that anti-gas protection is not limited, as it is in field warfare, to apparatus and devices that can stand rough usage and be carried without inconvenience by the already burdened soldier. One form of anti-gas defence has been mentioned above—the supply of pure air under slight pressure to rooms sealed from contact with local air. Improvements on this line of progress would include more and more of the interior chambers of a work in the protected space, while other devices made the gun embrasures as gas-tight as possible. The most important defence against gas is the impermeability of the structure of the work itself, which practically means its solidity under bombardment. The direct influence of aircraft on permanent fortification is not easy to estimate. There is no limit to the power and flexibility of anti-aircraft guns sited in fixed defences. All fighting elements in the works are fully protected against the attack of super-heavy artillery, and *a fortiori* against that of air-bombs. The attack of *traditore* or *caponnière* embrasures by machine-gun fire from low-flying planes, if practicable, could be

easily countered. Direct attack from the air, therefore, is not likely to affect design seriously. But observation from the air is another matter. Local superiority in the air may pass, in the course of the operations, back and forth several times, and design has to provide against the unfavourable case. It may be assumed with certainty that, in prolonged operations (such as by hypothesis the reduction of a permanently fortified front would entail) every battery position of the defence would be photographed, whether inside a group or fort or placed in the "interval." The defence is thereby compelled either to change position very frequently, or to build in. In the latter case, either the guns must have full fighting protection, or must be so buried and camouflaged as to be practically invisible to eye and to camera at a height of, say 15,000 ft., even when in action, while at the same time provision must be made for confusing the enemy's sound-ranging records. Here, then, the engineer is in the hands of the artillery researcher. Should the latter not succeed in producing gun-mountings, ammunition, and sound-camouflage (so to call it), which can defy the air-observer and the sound-ranging instrument, the engineer will be compelled to put his main armament again under concrete and armour, and perhaps to concentrate it somewhat. The alternative of frequent changes of position has many disadvantages, chief of which perhaps is the probability of having to traverse areas systematically infected by mustard gas.

**Armoured Vehicles in the World War** were of two classes, the slow-moving cross-country tank and the armoured car. It seems probable that these will fuse into one class, the fast tank. The tank was originally designed for traversing and crushing wire entanglements, and it is in this capacity that permanent fortification is chiefly concerned with it, for the defenders of solid permanent works are practically immune from its actual attack. The question for the engineer is—will the present types of obstacle-flanking organ succeed in dealing with the tank, and if not, how must they be modified? One type of obstacle, the deep ditch with vertical counter-scarp, is impossible for the unprepared tank, but such ditches are liable to be bridged at ground level by suitable girders carried by a "bridging" tank; and the best safeguard of permanent works against invasion by tanks is the fact that the latter must traverse a belt of ground which is swept at close range by an organ specialized for that duty alone, and invulnerable to the tank's guns. Although the dimensions of tanks will doubtless be taken into account in planning ditches, the first care of the designer will be to provide flanking pieces sufficiently powerful to destroy the tank as it crosses the line of fire, and to provide flanking fire in such a form that a disabled tank will not mask it. More generally, permanent works which form a section of a long battle zone will be organized to participate in the anti-tank defence of the system, and for this duty the *traditore* batteries are naturally the most appropriate organ.

The armoured car, or fast light tank, owing to its ability to make an inroad from a great distance at the shortest notice, may prove very dangerous to a fortified area which is in the crisis of mobilization and war armament. Special measures to deal with this risk could never be omitted; so far as fortification is concerned it would seem necessary to maintain at all times a clear field of fire for, and a state of readiness in, the *traditore* batteries, as well as in such gun positions of the safety armament as command obligatory or probable points of passage in the foreground.

**Field and Heavy Field Fortification.**—The methods of field fortification in vogue at the outbreak of the World War (see 10.719) were concerned essentially with light fortification, that is, incidental fortification on the battlefield. Starting from the conception of an advance brought to a standstill or a retreating army turning to fight, the engineer gave the infantry man types of works which were defensible after an hour's labour and which could be improved gradually during a more prolonged stay in the position. Lateral and overhead cover were provided, but only against rifle, machine-gun and the lightest artillery fire. Great stress was laid upon concealment, obtained by moulding the work as closely as possible to the ground, turning exposed soil, keeping relief as low as conditions of effect allowed, and also upon communications; a system of short trench lengths was preferred to long continuous lines, which entailed unnecessary labour and assisted the enemy to locate the defences. A good field of fire up to 400 yd. from the lines was considered essential. Pivotal positions, whether localities, woods or hills, were organized for all-round defence. These principles, so long as the general course of the operations retained the foreseen open-warfare character, substantially justified themselves; perhaps, indeed, they justified themselves only too well, since it was the great strength of even lightly fortified fronts which compelled each side, in France, to extend ever further and further to a flank in the hope of turning the opponent's frontal defence, and so in the end produced a trench-line that was continuous from the Swiss frontier to the English Channel. The deadlock which ensued marked the beginning of a position-warfare which was locally indistinguishable from siege warfare as that term was understood in 1914. Nor was it only from the point of view of local, minor tactics that the analogy of siege operations held good. The succeeding campaigns were indeed a siege of the east front of Germany, whose western offensives of 1916-8 have sometimes been described by the Germans themselves as sorties from the *Festung Frankreich*. For the Allies, as against these

offensives, the nature of the defence, especially after the middle of 1916, resembled that of an investing cordon attacked by a desperate sortie, and fighting to gain time for the arrival of forces from other parts to drive in the prisoners and bolt the door again,—though it is true that the siege was mutual and the "sortie" was at the same time a penetrating assault.

Regarded from this point of view, the principal factors which, directly or indirectly, governed revolution were: (a) a theatre of war richly provided with communications; (b) highly developed industrial resources at the back of both sides; (c) enormous numbers of men and therefore labour power; (d) an initial situation of tactical deadlock in positions not deliberately selected but representing only the line on which offensive effort in open warfare had expired; (e) the haunting idea of a break-through, followed by exploitation in open warfare in the old style.

Taking the technical effects of (d) and (e) together, it was inevitable that positions naturally unsound should be maintained by an equilibrium of forces acting in opposite directions. The attacker of the moment was necessarily attracted by these weak sectors, while the side which intended to attack in the future had a strong motive for holding as forward a position as possible. Fortification was called upon to make these intrinsically unsound positions safe, and all its resources in design and labour were taxed to the utmost to meet the call.

Taking (a), (b) and (c) together, we find these factors enabling each side to produce, to bring up and to apply *in situ*, technical stores on a scale hitherto undreamed of in siege warfare.

Taking the factors singly (a), by enabling artillery to be collected in enormous strength for an attack, compelled field fortification to develop unimagined powers of passive resistance, and by facilitating the concentration of great attack masses, induced commanders to strip non-offensive sectors of every human defender who could be spared, thereby forcing fortification to adopt forms which required a minimum garrison. By (b) there were brought into current field use not only materials hitherto reserved for permanent work, e.g. concrete, but also novel scientific devices and weapons of war, such as the air camera, gas, tanks, and, above all, improved methods of production, which increased the quantities of guns, ammunition and machine-guns available per unit of living force. By (c) trenches and obstacle-lines were multiplied to such an extent that there were eventually 20 to 25 miles of trench-work for every linear mile of frontage. Through (d), in the first year of trench-warfare, numerous bitter fights were engaged in on all parts of the battle-front for minor rectifications of position; in these fights there were developed new forms of detail tactics, with corresponding demands upon rear resources for a varied armament for the front-line combatant, whose equipment finally comprised, besides rifle and bayonet, grenades (hand and rifle), the light and medium trench mortars, flame throwers, periscopic sniper-rifles, knives, clubs, helmets and body-armour, not to mention gas masks. It led, further, to the retention of waterlogged trenches, and so to the introduction of pumping apparatus, trench-flooring, and other bulky non-combatant stores, into the front line. Through (e) it was demanded of fortification that it should protect both the masses of men assembled for attack and exposed to enemy "counter-preparation," and also the minimized garrisons of other parts of the front. These factors, operating, singly or together, with different relative intensity at different times, caused position-warfare to evolve, between 1914 and 1918, through three distinct phases, which may be distinguished by the titles field-fortification, position-fortification, and zone-fortification. The first of these characterized the western front from the end of the battle of the Marne to about the end of 1915, and the eastern front from the beginning of stabilization (which occurred at different periods on different parts of the front) to July 1915, and then again from Oct. 15 1915 to the end of the war on that front. On the eastern, Salonika, and extra-European fronts, evolution did not pass beyond this stage, because in these theatres the more important of the factors above enumerated were more or less inoperative. The second stage, position-fortification, is that of the Battles of Verdun, the Somme and the Aisne and the Artois battles of 1917; also of Asiago and the last six of the Isonzo battles on the Italian front. The third stage, zone-fortification, is characteristic of the Flanders battles of the latter half of 1917 and of all the 1918 battles. These indications of date do not of course imply that the changes specified came into force, formally and simultaneously, at any specific time. They are landmarks in the evolutionary process, which in this, as in other things, does not tolerate leaps.

In the first period fortification devotes itself, substantially, to the improvement and multiplication of the trenches bequeathed by the expiring offensives of 1914. The trenches are deepened, kept narrow, provided with more numerous traverses and shelters, though the protection afforded by the last-named only with difficulty manages to keep up with the increasing volume of fire from the enemy's medium howitzers. The close ranges at which the 1914 offensives died have left the opposed front lines separated by a very narrow "no man's land," which is heavily wired by both parties. Concealment, as understood before the war, has thus lost its significance, more especially as all trench systems are regularly photographed from the air. Detail fighting produces the need of circulation and supervision trenches and other parallels behind

"the trench," and calls for more numerous communication trenches, to which there is no further objection on the score either of concealment or economy of labour. In plan, the general result is an irregular skein of trenches, from 50 to 150 yards across, following the contour of the front line, which itself undulates considerably and at certain points forms sharp cusps or salients of local importance. The closing-in of key positions for all-round defence, which figures in pre-war fortification, has become more thorough, and internal subdivision has converted these wired-in areas into the "Labyrinth" of Neuville-St. Vaast, the "Hohenzollern Redoubt" of Hülluch and the "Trappe" of the Champagne battlefield. At the same time the interpretation of what constitutes a "key" position is different; it is chosen in relation to the trench system rather than in relation to the ground. Mining plays no small part in the fight for the possession of particular hillocks, or trench lengths, with a view to improved observation or better defence. But from the standpoint of evolution, the most important difference between 1915 and 1914 work is the deliberate withdrawal of the infantry fringe-line behind the military crest of the position. This was far from being universal in practice, but it had become the recognized ideal. As in permanent fortification, so also in field, the preservation of the close-defence element from bombardment was the motive of abandoning the command of the foreground. Stress begins to be laid, especially, on the local flanking of wire by machine-guns in covered emplacements. But—again as in permanent fortification—the needs of the artillery observer frequently conflict with those of the close-defence; and each local problem, solved according to the value attached to these conflicting requirements at one time, has to be re-solved by fighting when the conditions change.

In this phase there are no marked innovations in the materials employed. The works are cut deeply in the earth and revetted by the conventional sandbags, hurdling, etc. of the text-books; details typical of trench-warfare fighting, such as trench blocks, sap-heads, island traverses, have been added. The "shelter" has become the "dugout," roofed in by layers of logs, house material, or in exceptional cases railway iron, and as a rule, though not always, withdrawn from the front line into one of the parallels behind. Guns are casemated, and dugouts provided for their ammunition and personnel as well as for a variety of command posts, aid posts, signal offices and the like.

In the second phase, which grew by degrees out of the first, the technique of fortification is modified owing to new conceptions of general tactics and to the bringing in of different materials. This is the phase that will remain forever typical of the western front campaigns. Its chief tactical characteristic is intense preparation and concentration of means of all sorts on the attack front, with a corresponding absence of the surprise element. The first consequences for fortification were: (a) the deepening of forward dugouts, and their construction by mining methods which leave the natural earth undisturbed; (b) the quasi-certainty of losing the first trench system, at least temporarily, with the certainty of its being reduced to a tormented ruin in any case; (c) reliance for close-defence upon the concealed machine-gun almost to the exclusion of other weapons; (d) multiplication of systems instead of multiplication of trenches in a system; (e) more elaborate provision for the maintenance of supply for forward troops, represented in practice by the accumulation of stores in forward dumps of all sorts. It was in positions organized on these lines that the Germans fought out the battle of the Somme. But their Higher Command did not at first accept the implications of (b), and paid a heavy penalty for attempting the impossible task of holding the devastated front line in strength. Especially heavy was their loss in prisoners, due to the "deep" dugout, which was so deep that the men could not get out of it in time to man the trenches. Yet without adequate protection it was impossible to hold the front line, or any other line, under bombardment, even after converting it into a line of machine-gun posts; and the first modification due to the Somme experience was the introduction of the only alternative to the deep dugout, viz. concrete. This was a step of great importance, both tactically and technically. Concrete had already been used, here and there, to reinforce parts of an earth-system, and was constantly employed in various back-area installations. But it was not till the latter part of 1916 that it became the principal material of "field" fortification. Instructions for mixing quick-setting concrete, and even for making ferro-concrete, on the spot began to figure in training manuals, and in the chief belligerent countries a new industry sprang up for the manufacture of standard concrete elements, which are transported to the scene of operations and built up as required. The timber, mine-gallery framing hitherto used in dugouts gives place largely to standard semi-cylinders of corrugated iron, also made at home and transported to the front in great numbers. Thus the ideal dugout for troops becomes a concrete structure lined with corrugated iron, proof against all field and medium calibres without being buried to any great depth; and the machine-gun emplacement and its dugout are used in one concrete or ferro-concrete structure of the casemate type, famous in 1917 under the name of "pillbox" or "Mebu" (in full *Maschinengewehr-Eisenbeton-Unterstand*). With this, the trench itself becomes of secondary importance. Though tradition and its undoubted usefulness in all circumstances except those of great-battle days made

the command in all countries exceedingly unwilling to give up the trench altogether, it is the chain of dugouts and machine-gun casemates, which, with the wire, defines the "position" of position-warfare at its highest development in the spring of 1917.

In the broadest sense, a "position" consists of several distinct, and more or less parallel, systems, each of which is at such a distance from the one in front that the enemy's artillery must change position—with all the attendant difficulties and delays of repairing communications through the battle-devastated area—and mount a new attack. At intervals, a switch-line, designed on the same general principles as the parallel lines, is drawn so as to bolt off the area which may be lost in one battle phase. Between the first and second systems lies a zone in which a very active infantry resistance is carried on by means of "strong points," which are no longer labyrinths of the 1915 type but well protected and wired-in machine-gun strongholds, resembling in principle the *traditore* batteries of permanent fortification. With these as a basis, light trench-work will be run out in the directions required by the battle-situation from time to time, e.g. so as to fence off a lost sector; and for this purpose conveniently situated shell-holes are made defensible so as to constitute the framework of such lines. Tunnelling is largely used for short communications, especially where forward slopes have to be held so as to include artillery observation positions. The trench system bequeathed by the older methods is now broad (12 ft.) as well as deep, and is utilized as a covered-way, defensible in emergencies, rather than as a battle element. From 3-ft. to 5-ft. thickness of concrete (or ferro-concrete) over corrugated iron covers the casemated guns and machine-guns. With dugouts of similar design (the old deep dugouts are now sealed up or filled up by order of the command) these constitute the new defence system, whether disposed in lines or belts along the frontal systems or switch-lines, or scattered in the intermediate areas. Wire is now disposed in very wide belts, and does not conform to the direction of the trenches but lies in irregular salients and reentrants, each part under the eye of some machine-gun or trench-gun casemate. In short, the site of the "position" is governed by the needs of artillery observation, and by those of supply, while the organization of the site is based on the time, labour and material available for the construction of *casemates and dugouts of concrete*.

But "trench" warfare has thereby divorced itself from the element which has been its characteristic for ages, the trench, and from June 1917 to the close of the World War is the period of zone-fortification. The elements of defence are now dispersed in innumerable "nests," containing machine-guns, anti-tank guns, or counter-attack groups. The "position" attains hitherto unheard-of depth, and its forefront is held only by outposts, whose function is to police the ground in quiet times and give warning of assault in battle. Behind the "outpost zone" lies the "battle zone," in which machine-gun and anti-tank-gun defence break up the attack, which a counter-stroke then sweeps back to its starting points. As a precaution, a "rear zone" is organized behind the battle-zone. But field-fortification has at this stage been completely merged in field tactics, which it assists, no longer by ingenious tracing of lines of defence, clearances of foreground, economical disposition of working parties and materials, but simply by placing, at points indicated by the tactician, standard casemates and personal shelters, borrowed from the practice and made with the materials of permanent fortification.

Thus, while permanent fortification is concentrating its stock of ideas and devices upon the task of holding a long front of diminished depth, without any yielding of ground whatever, against the heaviest bombardments, field tactics have become fluid and mobile, ground being lost and won almost as readily as in the days of "manœuvre" warfare, though by different methods. It is at the points of junction between permanent fronts and field fronts, where particular features of ground are neither quite indispensable nor yet of negligible importance, that a field-fortification of the future will probably find its proper scope. Like the zone-fortification of 1917-8, but to a further extent, it will have at its disposal many of the forms and methods of permanent fortification. **SIENKIEWICZ, HENRYK** (1846-1916), Polish novelist (see 25.54), died at Vevey, Switzerland, Nov. 14 1916.

**SIERRA LEONE** (see 25.54).—There was a modification of the S.E. frontier in 1911, when Sierra Leone acquired the Kanre-Lahun district from Liberia in exchange for a district on the Morro river. The new boundary was delimited in 1913-4, Col. Cowie being the chief British commissioner. The total area of the colony and protectorate is estimated at 31,000 sq. miles. The census of 1911, partly based on estimates, gave a population of 1,402,878, Freetown, capital and chief port, having 34,090 inhabitants. The European population numbered about 1,000, that of the colony (as distinct from the protectorate) being 702, including 62 women; the Sierra Leonians some 70,000. There were also some hundred Syrians, almost all traders.

The commerce of Sierra Leone is bound up with the products of the oil palm, which constitute some 75% of the exports. Next in importance is the kola nut, in universal demand among the natives of West Africa; scarcely any of the nuts reach Europe. Minor exports are ginger, piassava fibre, gum copal, rice and hides. Rubber and ivory have virtually ceased to be exported; cotton-growing experiments were abandoned. Native cocoa plantations have been made since 1910 in the Northern Sheburo district, but up to 1920 cocoa did not figure in the exports. From 1909 to 1913 (inclusive) there was a steady expansion of trade, the total value rising from £1,960,000 to £3,481,000, imports and exports being almost equally balanced. Revenue showed a corresponding expansion, from £361,000 in 1909 to £618,000 in 1913. Expenditure in the years named was £336,000 and £622,010 respectively. During this period, in 1912, an extension of the railway going north from Boia junction on the Freetown-Liberian border was begun. In 1916 this northern line reached Kamabai, 118 m. from Boia and 182 from Freetown. A loan of £1,000,000 raised in 1913-4 was expended as to £308,000 on railway extension and as to £110,000 on improvements to Freetown harbour. As to shipping, British tonnage in 1913 was 2,050,000 out of a total of 2,931,000 tons, and during and after the World War the proportion of British tonnage increased.

At the beginning of 1914 a fall in the prices paid in Europe for palm kernels, rubber and other products of the country led to a decline of trade, and the outbreak of war in August aggravated conditions, as the German market was closed. Some 87% of the palm kernels had been exported to Hamburg, and the British kernel-crushing machines could not cope with the great quantity of kernels diverted to the Liverpool market. The erection of new oil mills in England—the oil enters largely into the composition of margarine—met this difficulty, but in 1915 a decrease in the market value of the kernels led to a smaller return from a larger output than in 1914. By 1917 however the quantity of kernels shipped exceeded that ever previously exported and also realized a higher price. Of 58,000 tons exported France took 1,380; the rest went to the United Kingdom. Thus the readjustment of trade was safely accomplished. As to palm oil, next to kernels the most important export, the greater part was always taken by Britain. (Of 828,750 gal. exported in 1919—the largest quantity exported for 10 years—Great Britain took 819,375 gallons.)

By 1918 the total value of trade was £3,197,000, the United Kingdom taking over 50% of the exports and furnishing over 80% of the imports, the United States providing the bulk of the other imports. Trade in 1918 surpassed in value that of any year since 1913, and there was a further marked rise in 1919, when exports were valued at £2,101,000 and imports at £2,034,000. Excluding Government imports, exports showed an excess over imports of £12,000, as compared with an excess of imports in 1918 to the value of £163,000. The high figures both for 1918 and 1919 were, however, due largely to inflated prices, though there was also an increase in the quantity of exports. Revenue in 1919 was the highest recorded—£748,000, expenditure being £740,000. The estimate for 1921 put both revenue and expenditure at over £1,000,000.

The colony and protectorate made progress in spite of the World War. There was an increased demand for education among the natives, chiefly met by the missionary societies, but the Government maintained schools for Moslems, and an agricultural training college for vernacular teachers was established at Njala, in the protectorate. In 1919 there were 163 elementary and intermediate schools in the colony and protectorate, with an average attendance of 6,285. Including secondary and technical schools there were in all 192 centres of education with over 12,000 pupils on the rolls. Sir L. Probyn, appointed Governor in 1910, was succeeded (1914) by Sir E. M. Merewether, and (1916) by Mr. R. J. Wilkinson. The natives showed much loyalty to Great Britain during the World War, and the Sierra Leone forces played a prominent part in the Cameroonian campaign.

Notwithstanding the increase in trade, 1919 witnessed much distress in the colony and protectorate. Owing to adverse weather conditions in 1918 and an epidemic of influenza at harvest time, there was a great shortage of rice and other food crops, and famine resulted. This led in July 1919 to serious rioting, the Syrian traders, who were accused of hoarding food-stuffs, being attacked and driven from their houses and stores. As the bulk of the kola nut trade was in the hands of the Syrians that industry suffered severely. The high price of imported goods also caused much distress. The year was further notable for the prohibition of the import of "trade spirits," but it was not until 1920 that total prohibition was enforced.

**SIFTON, SIR CLIFFORD** (1861– ), Canadian politician, of Irish descent, was born in Middlesex, Ont., May 10 1861. His father, John W. Sifton, was Speaker of the Manitoba Assembly, and the son, after graduating at Victoria University, Cobourg, was called to the Manitoba bar in 1882, and six years later entered the Manitoba Legislature as member for North Brandon. He was Attorney-General and Minister of Education from 1891 to 1896, became Q.C. in 1895, and from 1896 to 1905 was Minister of Interior in Laurier's Dominion Cabinet. In 1911 he opposed Laurier on reciprocity. He was agent of the British Government in the Alaska Boundary Tribunal (1903); represented Canada at the International Conference on Conservation (Washington, 1909) and was chairman of the Canadian Commission for Conserving National Resources (1909-18).

His brother, ARTHUR LEWIS SIFTON (1858-1921) was elected to the N.W. Assembly in 1898 and was Chief Justice of the N.W. Territories (1903-05) and of Alberta (1905-10). Premier of Alberta from 1910 to 1917, he then became a member of the Dominion Cabinet. As Secretary of State for Canada he signed the Treaty of Versailles.

**SIGHTS** (see 25.60).—Although in the years before and during the World War, the instruments employed in artillery work were considerably improved and developed, research was in the main directed rather to auxiliary instruments such as rangefinders than to gun and rifle and machine-gun sights as such. It may be said, therefore, that the modern artillery sight, as designed before 1914, stood the test of war; and the task of the present article is only to review developments. In one respect, however, those developments were wholly new. The anti-aircraft sight which was virtually non-existent in 1910, has already become an elaborate instrument and its evolution is still in progress. Considerable importance—practical rather than technical—attaches also to the new machine-gun panorama sight and to the application of aperture sights to the military rifle and light machine-gun.

**Gun Sights.**—The purpose of a sight is to ensure the accurate laying of the gun both in direction and elevation. The sight must provide for movement in a vertical plane to register the "angle of sight," the "tangent angle," and hence the "quadrant angle," and thus the range for which the gun is laid; also for movement in a horizontal plane, to allow the direction of the gun to be corrected for deviation due to "drift," wind, want of level and any movement of the target. In order that the operation of laying shall be unaffected by firing, the sights are in modern equipments fixed to a non-recoiling part of the carriage; this may be the cradle, the trunnions, or the intermediate carriage, and, in the last-named case, it must be so connected to the trunnion that the same angular movement is given to it as is given to the gun.

Laying for elevation may be accomplished in the following ways:—  
(a) By setting the required tangent angle in the sight and directing the sight-line upon the target. (b) With fixed mountings on level platforms, the quadrant angle may be registered on an elevation or range indicator incorporated in the elevating system; or, with both field carriage and fixed mountings, the gun may be laid at the required quadrant angle by means of a clinometer. (c) With fixed mountings at a definite height above sea-level, by connecting the sight through a cam with the intermediate carriage in such a manner that for a given quadrant angle the sight is automatically depressed to the correct angle of sight.

Laying for direction may be either direct or indirect; direct when the sight-line is aligned on the target, indirect when a convenient object or auxiliary aiming-mark is used. It may be accomplished as follows:—  
(a) By aligning the sight-line upon the target, the inevitable deviation of the shell from the vertical plane containing the gun being allowed for automatically, or set on the sight as deflection. (b) By using a panoramic sight and any convenient aiming-point; the horizontal angle between aiming-point and target is determined and set on the sight and the latter aligned on the aiming-point. (c) With fixed mountings, by obtaining the direction from an independent source and setting it on the oriented training-arc on the pedestal.

For laying both in elevation and direction it is essential that the sight should be truly vertical. This is attainable easily with a fixed mounting; but with field carriages the wheels or the platform may be out of level; in such a case, the elevation registered on the sight will not be correct, and the gun will shoot towards the lower side. If, however, the verticality of the pivot be maintained, it is immaterial whether the carriage basic structure be level or not. Adjustment for verticality is permitted by the reciprocating principle, in which the sight can always be made to move in a vertical plane parallel to that containing the axis of the gun. Thus the sight-line

and gun, when laid, lie in parallel vertical planes, so that neglecting drift, etc., correct direction is obtained.

Means to compensate automatically for drift of the projectile by giving appropriate deflection to the gun are usually introduced into the sight. As drift increases with the range, so also does the necessary deflection; but in some instances, a fixed deflection (representing an average correction) is put on to the sight system. The correction is effected by arranging the sight, when setting for elevation, to move in a plane inclined slightly to the vertical and intersecting the vertical plane in a line parallel to the axis of the gun; thus the greater the elevation on the sight, the greater the automatic deflection imparted. This method of compensation allows of a convenient combination with the reciprocating sight, by mounting a transverse bubble in such a manner as to ensure that, when central, the body of the sight is tilted to the left at the required angle; but the open, telescopic or panoramic sights are mounted on the rocking portion so as to have true verticality when the bubble is cross-levelled. Thus the cross-levelling gear neutralizes any want of level, and permits drift to be corrected for by movement of the sight in a tilted plane when setting for elevation; but the range-scale must be graduated to register elevation in a vertical plane.

In the system of independent line of sight in use with certain light field carriages the two parts of which the quadrant angle is composed—the angle of sight and the tangent angle—are applied to the gun independently and by different men. This system necessitates an intermediate component carrying the sight, and two elevating systems, the lower of which elevates the intermediate component, sight, cradle and gun for angle of sight, and the upper elevates the cradle and gun for tangent angle. Thus, conjointly, the two elevating gears give the quadrant angle. A sight clinometer is fitted to the sight to register the angle of sight for indirect laying, whilst a range-indicator, operated by the upper elevating gear, registers the tangent angle. Once the sight has been aligned on the target, the tangent angle may be altered to correct the range without disturbing the layer for direction. Such a system is useful when firing at moving targets, the direction and elevation having to be altered simultaneously, but it has a disadvantage in that it is difficult to apply the reciprocating principle when the gun has to be moved independently of the sight. Drift is usually corrected for by inclining the trunnion axis. The latest method of securing this principle, though not truly "independent," combines the reciprocating sight with an automatic drift correction.

FIG. 1

The rocking-bar sight is mounted on a pivot which is always parallel to the gun axis, and thus can be rocked laterally under the control of cross-levelling gear to maintain verticality, which is indicated by a transverse bubble. An acorn-pillar, or front sight, and notched leaf, or rear sight, are fixed at the extremities of a sight-bar, which is mounted on a vertical pivot on top of a rocking-bar; the rocking-bar is pivoted transversely at the front of a sight-carrier attached to a support on the cradle. The sight is set for elevation by means of a worm and arc-pinion drive in mesh with an arc on the rocking-bar, the range or tangent-angle being registered on a drum fixed to the pinion-spindle. The pivot of the rocking-bar is inclined so as to give an approximate drift correction at all ranges. To give deflection, the rear of the sight-bar is fixed to a nut mounted on an endless screw carried at the extremity of the rocking-bar; the nut traverses across a degree scale fixed to the rocking-bar. Bearings for a telescope are fixed to the sight-bar.

A sight clinometer is usually fitted to the rocking-bar so that, if necessary, the sight can be set first for angle of sight and subsequently for tangent angle. In effect, the clinometer is an adjustable spirit-level. A bubble is mounted in a sliding segment having worm-teeth cut on a curved base; the segment is moved relatively to a carrier by a screw mounted in the latter and in mesh with the teeth. Degrees of elevation or depression are registered on the face, while the screw is fitted with micrometer head to read minutes.

The employment of muzzle-velocity correctors for use in conjunction with the range drum is becoming general. The corrector (not to be confused with the "corrector" employed for varying the height of burst of time fuzes) also provides means for determining the muzzle velocity from firing at a known range, allowances being made for standard conditions; sights so fitted are known as calibrating sights. The corrector, which may be attached to the oscillating bracket or to some part of the range-gear in independent-line sights, fits over the face of the range-drum and is graduated in ranging muzzle velocities; a knife-edge reader, hinged at one end, has the other end attached to a nut mounted on a screw in the corrector and engraved with an arrow for reading the muzzle-velocity scale. The knife-edge reads the yard-scale graduations while fine adjustment along the muzzle-velocity scale is ensured by the nut-and-screw arrangement. The yard-scale is engraved upon a spiral designed in conjunction with the muzzle-velocity scale to give the correct tangent angle for the muzzle velocity used.

FIG. 2

With certain carriages it is inconvenient to mount the sight on either the trunnion or the cradle. In such cases the sight is mounted upon a pivot on the intermediate carriage, the sight-carrier being constrained, by means of parallel link-motion gear, to make the same angular movement as the gun. For the sight to be effective, the parallelogram must be correct, and adjustments may be required for the lengths of the link and the arm. In certain designs the independent line of sight is obtained without the use of an intermediate component, and combined independent-line and reciprocating sights are also in use.

The automatic sight is discussed and an example illustrated at 25.64; here, therefore, it is sufficient to recall its basic principle, which is, that for a gun mounted on a level platform at a fixed height above mean sea-level, there is only one angle of depression of sight and one quadrant angle for any given range. Thus, if the sight be pivoted transversely to the cradle and made with an arm projecting downwards from its front end, there is, for a given quadrant angle, one position only for the lower extremity of this arm; if the arm be caused to engage with a suitably cut cam fixed to the intermediate carriage, any quadrant angle on the gun will impart the correct sight-depression to the sight.

A distinctive feature in connexion with all anti-aircraft sights is the necessity for an automatic reduction in the tangent angle for a given range as the angle of sight and quadrant angle increase. Consequent on the varying range, height and speed of aerial targets, large corrections have to be applied to compensate for the vertical and lateral angular movements of the target; these corrections inter-

act to complicate further the design of an efficient sighting system. No description of such a sight, therefore, is possible within the limits of this article. For reasonable accuracy of fire, the mounting must be level. Anti-aircraft mountings are generally fitted with training arcs; in some cases a second set of indicators is fitted to enable horizontal ranges and quadrant angles to be used. A sighting system which also embodies the principle of the independent line of sight has been tried in the British service.

The panoramic sight is used with field ordinance for indirect laying for direction, from a position out of view of the target. The layer is enabled to take advantage of any auxiliary aiming-mark and to lay without exposing himself. The sight may be used also for direct laying.

A typical panoramic sight is shown in fig. 1. It is a prismatic telescope mounted in a vertical tube having a rotating hood at the upper, and a horizontal tube at the lower end; the hood is mounted on a horizontal graduated dial-plate with which it may be revolved through a complete circle, by worm-gearing; the worm-spindle is mounted in an eccentric to enable the worm to be thrown out of gear for quick setting; on the periphery of the dial-plate are graduations read by a pointer fixed to the vertical tube; while the ends of the worm-spindle are fitted with micrometer-heads to read smaller divisions. A prism mounted within the hood can be rotated about a horizontal axis by means of a worm-spindle in mesh with a toothed arc on the prism holder; this permits of a wide selection of aiming-points in the vertical plane. The optical arrangements are shown in fig. 2.

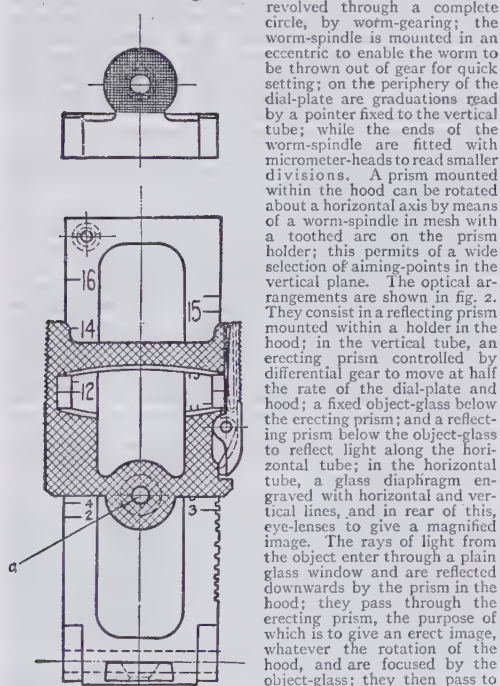

FIG. 3

which is seen on the cross-lines of the diaphragm, the latter being illuminated by a plain window let into the horizontal tube.

Other forms of dial sight are, the simple graduated and flexible dial fitted with an open sighting-bar; and the *collimator*, which exists in several forms. In principle an eye-lens and ground-glass window are mounted at the ends of a tube, an arrow or cross on the window being at the principal focus of the lens. With one eye applied near the lens, the cross will be seen, but there is no vision beyond the cross due to the ground-glass; the other eye sees the aiming-point. The gun is traversed until the cross appears superimposed on the aiming-point. Both eyes are used, and are viewing approximately parallel rays. Unlike ordinary open sights, there are not three points at varying distances to be brought simultaneously into alignment, but the eyes view two points under practically the same conditions.

**Sights for Rifles and Machine-Guns.**—The improved ballistics of rifles generally, on the one hand, and the shortening of the sight radius due to shortening of the barrel, on the other, have made the question of better sights a very urgent one. Attempts to retain the old sight radius by bringing the rear sight closer to the eye resulted in the discovery that it was impossible effectively to use an open sight nearer than twelve to fourteen inches from the eye (owing to the inability to focus on rear sight, front sight, and target at the same time) and led to the reintroduction of the aperture or peep sight, in itself an old invention. In this the rear sight is placed close to the eye, and no attempt is made to focus on the aperture. The

eye looks through the aperture and instinctively centres the front sight. Any blur around the aperture will not impair the accuracy as it is equal on all sides of the opening. If the eye is now focused on the target, the front sight is at sufficient distance to afford very good definition. Another advantage is that the accuracy of the sight is not affected by slight changes of light.

Aperture sights are of two general types: the disc aperture consisting of a large disc, which shuts off all view of the target except that seen through a peep hole of from .03 to .06 in. in diameter; and the Lyman type which has a thin rim with peep hole about .010 in. in diameter. Disc sights, which are used principally for target shooting, are unsuitable on account of their limited field for moving-targets, or where quick aiming is required.

In the Lyman type the entire target and its surroundings may be seen while aiming; it may be used in poor lights where open sights cannot be used, and moving objects may be quickly aimed at. The sights on the British 1914 rifle (U.S. Rifle Model of 1917), and the Browning automatic rifle are of this type (fig. 3). The aperture (a) is 0.1 in. in diameter, and is made through a disc of about twice the diameter of the aperture. The battle-sight<sup>1</sup> is vertical and is used when the leaf sight is flat and vice versa; the sizes of aperture and ring are the same in both. This sight was found very satisfactory during the World War. It has no lateral adjustment, service experience having shown that the sights were satisfactory without this refinement. An aperture 0.1 in. in diameter is thought by many to be too large, .070 in. to .080 in. being the size most favoured. The U.S. 1903 Rifle (Springfield), and the now abandoned Ross rifle are the only other military rifles with an aperture sight. In the case of the Springfield, which has also sight notches of the usual type on the slide, it is found that, although the aperture is very small (0.05 in.), and too far from the eye, it is always preferred to the V. for fine shooting. The superiority of the aperture sight over the open sight is in fact now generally admitted. It is almost universally used by rifle experts, and the delay in its general adoption for military use is due to the impracticability of effectively and cheaply applying it to rifles now in existence.

Optical rifle fore sights designed for use with aperture rear sights have recently been placed on the market. These sights consist of a dioptric convex lens of magnification of about 2½ diameters, with a spot or ring in the centre for use as a bead. The lens when viewed 3 or 4 ft. from the eye gives an upright magnified image of distant objects. An aperture rear sight, preferably of the disc type, with an aperture of 0.03 to 0.04 in. diameter, or a lens rear sight should be used. Better definition as well as magnifying power is claimed for these sights.

Luminous sights for night use have been experimented with and used to a limited extent on machine-guns and rifles for military purposes. These sights, as a rule, consist simply of metal sheaths which slip over the front sight and rear sight and have suitable containers for the luminous material used. For periscope sights see RIFLES AND LIGHT MACHINE-GUNS.

Telescope sights are often applied to sporting rifles and military rifles used for special purposes. These sights consist of a telescope with a reticule for aiming which takes the place of a front sight. The magnification is usually from 2.5 to 6 diameters; those from 2.5 to 3 power are considered the best for general purposes as they give a larger field and can be used in poor light. Adjustments for range are made either by moving the crosshairs only, as in most German rifle telescopes, or by means of holding brackets with adjusting screws which give both vertical and lateral adjustment; the latter type being more accurate. The advantages claimed for telescopic rifle sights are that they permit more accurate aim by magnifying the errors of holding the rifle, also that they allow objects to be seen more distinctly, particularly in a poor light. The latter is probably their greatest advantage; their superiority to a good aperture sight not being as great as is popularly supposed.

The Vickers and Browning machine-gun sight embodies the principal small-arms-sight developments of recent years. The slide, which is made to travel obliquely in the leaf to compensate for drift, has a revolving disc with apertures of various sizes which may be used for different ranges and light conditions. A fine adjustment for elevation and a windage adjustment are provided, also an open battle-sight. The fore sight is a blade, open or hooded.

The Lewis gun has a simple tangent aperture sight without drift or windage adjustments, but with a vertical adjusting screw for fine adjustments in elevation. The sights used for direct fire on Continental European machine-guns are all of the open type and are usually without correction for either drift or windage.

Tubular sights, which consist simply of a straight piece of tubing, are used to some extent on tank machine-guns, as these sights only require a very small opening in the armour plates for their effective use. The latest tendency, however, is to provide tank machine-guns with a telescopic sight of special construction.

Anti-aircraft machine-gun sights, which compensate for the drift and trajectory of the bullet and offset the speed and direction in

<sup>1</sup> A battle-sight is one which requires no adjustment for distance, or rather is permanently set to a certain range, inside which the bullet in its flight never rises more than a man's height above the line of sight.

which an aeroplane is travelling, were brought into use during the World War. One of these is illustrated in fig. 4, showing a design used by the British and U.S. armies. This consists of a slide having an aperture 0.25 to 0.5 in. in diameter and fitting on the regular back sight leaf. The aperture (b) is set at a given height for a standard range. The front sight has two concentric elliptical ovals which are mounted as a leaf sight to the barrel or casing of the gun. The shapes of the ellipses are proportional to the actual horizontal sections of a cone of fire from the gun at a given height and elevation. The design of the outer oval (a) is based on an assumed angle of gun elevation of 50°, height of target about 1,000 ft., and a speed of plane of 100 m. per hour; that of the inner oval (b) on an assumed angle of gun elevation of 15°, a height of 250 ft., and a speed of 120 m. per hour. The middle figure shows the correct firing position with the hostile plane central as viewed through the rear and front sights; that on the right shows a plane at close range flying at an angle with the gun position and perpendicular to the axis of the bore; and that on the left shows the target at a greater range and at an angle with the gun.

FIG 4

**The Panoramic Machine-Gun Sight.**—The use of machine-guns for indirect fire during the World War was followed by the demand for instruments for obtaining data and laying the guns. This demand led to the production of many devices, some of which were well fitted for their purpose, and some of which were make-shifts. But, as the war progressed, it became apparent that indirect fire was becoming increasingly important, and an attempt was made to produce one high-grade device that would replace as many instruments as possible. This effort, in the case of the United States, resulted in the production by the Ordnance Department of the panoramic machine-gun sight, described below. At the same time, all Browning machine-guns were fitted with a bracket on the left side which was designed to carry the panoramic sight and also to furnish on its upper surface a flat space for applying the clinometer.

The illustration (fig. 5) shows the panoramic sight in place in its bracket on the Browning machine-gun. The sight consists of a X6 prism telescope capable of movement in elevation and azimuth (360°). The movements of the sight are controlled by means of graduated knobs. The lower knob is for movement in azimuth (deflection), and a quick release is furnished to enable large changes to be made quickly. The upper knob controls the vertical movement of the sight. This knob has two sets of graduations. One of these is for ranges, and the second, which is on a ring-sliding friction tight on the knob, is for vertical angles, above or below the horizontal (angle of site). The telescope is provided with a spirit-level which is parallel with the axis of collimation. This instrument is used on the same principles as the panoramic sight of artillery, to measure angle of site and to lay the gun on a visible or invisible target. The telescope has, besides the usual cross-lines, graduations showing both vertical and horizontal angles, and also a vertical scale resembling an inverted sight leaf, which is employed for the correction of fire when the strike of the shots can be observed. The sight can also be used separately from the gun (in combination with a compass and a tripod of non-magnetic metal) for the same operations as those performed by our artillery director.

(J. S. HA.)

**SIGNAL SERVICE, ARMY** (see 25.71).—In the ten years that elapsed between the Russo-Japanese War of 1904-5 and the outbreak of the World War in 1914, evolution in military signalling was rapid, both as regards organization and as regards instruments employed. The old principle of deliberate crudity of means, based on the idea that no refined instruments could be relied upon to survive the rough conditions of war employment, was giving way to a sense of the great possibilities opened up by modern science as applied to army signalling, while, in tactics, the ever-increasing tendency towards articulation of forces and distribution in depth was forcing the problems of liaison more and more into the foreground. But such evolution as there was in the period 1904-14 was naturally slight indeed compared with that which took place during the World War, in which stabilized conditions of warfare and the concentration of the scientific talents of all belligerent countries upon war needs produced results, both upon the army signal system and its instruments, that amounted to a revolution in the practice of war and, moreover, must affect profoundly the methods of intercourse between civilized nations in peace.

In the following article an account is given of the organization, working principles, and instruments of the signal service of the British army in the World War, and of some of the more notable features of signal practice in other armies.

(1) **Definition and Duties.**—The signal (intercommunication) service of a modern army is responsible for the maintenance of efficient intercommunication between all branches, departments, formations, and units of the army. Intercommunication within units, other than signal units, is usually provided by means of regimental signallers, but the officers of the signal service exercise supervisory control here also. The signal service bears the same relation to the army of which it forms a part as does the nervous system to the human body. Its principal duties are:—

- (a) The transmission of information from the front to unit commanders and to the headquarters of formations.
- (b) The transmission of orders from commanders to their subordinates.
- (c) The maintenance of efficient liaison between infantry and other arms (such as artillery, air force, tanks, etc.) and between neighbouring formations.

For the efficient working of an army, means of intercommunication must be swift, certain, and, under the circumstances of modern war, varied. The system must be essentially simple and standardized to the greatest possible extent, yet capable of considerable expansion at short notice, and of modification to meet the most diverse conditions of warfare. Organization and working schemes must be elastic, and types of signal instruments must be devised to cope with all special sets of conditions that have been experienced or can be foreseen.

(2) **British Army System.**—Until the application of electricity to the long-distance transmission of messages, the intercommunication of armies was carried out mainly by means of visual appliances or by the use of message carriers. Liaison officers and orderlies have been used from the very earliest times; the arrow was frequently employed in mediaeval times for the transmission of information into and out of besieged towns; the pigeon was used with success, notably in the wars of the Netherlands against Spain; permanent lines of semaphore communication (masts with movable arms) were employed both by the French and the British during the Napoleonic Wars. Later, the invention of the Morse code and the adaptation of the semaphore principle to field signals led to the general employment of flags, lamps and, later, of the heliograph. The field telegraph made its appearance in the middle of the 19th century, and in the last years of the century the field telephone came into use. Lastly, in the Russo-Japanese War of 1904-5 wireless telegraphy came on the scene.

In 1911 the British "Signal Service" was constituted as a distinct branch of the Royal Engineers. At about the same time, the adoption of the buzzer telephone as a standard army instrument and the employment of the motor cyclist as a message carrier placed two new methods of intercommunication at the disposal of the signal officer. The outbreak of the World War in

Aug. 1914 found the Expeditionary Force equipped with a signal service controlled by a director of signals on the general staff at G.H.Q. This service included a signal unit at G.H.Q., a lines-of-communication signal company, and a signal company with each corps and each division. Artillery intercommunication was, however, entirely a separate matter for which that arm itself was solely responsible. So also, was intercommunication inside the infantry unit; and the absence of a chain of command within the signal service itself (each unit commander being responsible only to his own general staff) caused a looseness of organization which soon showed itself to be a grave defect. The means of intercommunication employed were those already mentioned, viz., telegraph, telephone, flag, lamp and heliograph, with the addition of wireless telegraphy, which was, however, at this time adopted only for the special requirements of the far-ranging cavalry division, and consisted only of one lorry and a few wagon and pack stations, all of rotary spark type. (The power of the stations was 3, 1.5, and 0.5 K.W. respectively; the range, when working to stations of similar type, 100, 80 and 30 miles.)

The signal organization summarized above proved adequate to deal with the mobile conditions of the first few months of the war. These early days were specially notable for the triumph of the motor cyclist. Telegraph and telephone, visual and orderlies, and mounted liaison officers also played useful parts, and it was not until position warfare set in in the winter of 1914-5 that further changes were found to be required. Then, however, the desire for, and the possibility of collecting, a greater quantity of more exact information (especially for artillery observation) led to a considerable increase in the complexity of the army signal organization. To the exigencies of position warfare may be attributed almost all the evolution in signal implements and signal organization which marked the course of the war. The chief alteration in signal policy, on the other hand, was brought about not so much by position warfare as by the resumption of semi-mobile and mobile warfare which took place to a slight degree in 1916, to a slightly greater extent in 1917, and completely in 1918.

The principal result of "stabilization" was naturally an immense increase in the number and weight of the guns employed. Both for offensive and defensive purposes massed artillery became the weapon of paramount importance, and this had two principal effects on the forward signal service. The fire of the large number of guns employed could not be effectively directed without a greater measure of intercommunication; while at the same time, intercommunication in the region subject to heavy gunfire became more and more precarious.

The extra intercommunication required was supplied by a rapid increase in the number of telephones in use at observation posts and at artillery headquarters. The need for intimate liaison between infantry and guns led to a similar increase at infantry headquarters.

The magneto telephone came into use for the first time forward of corps headquarters, and, once the superior convenience and efficiency of the instrument were recognized, the demands for its installation increased so rapidly as to tax the signal service to its uttermost capacity. A new danger at once arose and threatened to wreck the whole intercommunication service. The tendency was to concentrate all available energies on the installation of telephones and the laying and maintenance of telephone lines. All other means of signalling lost their proper proportion, and an inefficient telephone service was soon in a fair way to become the only means of intercommunication throughout the whole army. Such an undesirable result was only prevented by the incidental troubles arising from the indiscriminate laying of lines. In effect, it was the "overhearing" menace, which will be referred to later, that, together with the prevalence of induction trouble and the difficulty of making "safe" the forward lines, proved to the signal service and to the commanders it served that it was unwise to stake everything upon one method of intercommunication.

The difficulty of maintenance of forward intercommunication was overcome partly by the adoption first of shallow and subsequently of deep buried cable; partly by the evolution of various new alternative methods of signalling; partly by the perfection

and adaptation of methods which had temporarily fallen into disrepute under the new conditions.

In 1915, cables were buried 2 or 3 ft. deep and by this means temporary immunity from shellfire was gained; in 1916, the general adoption of the 6-ft. bury (while it saddled the signal service with endless labour problems) successfully solved the difficulty of the maintenance of an efficient forward telephone and telegraph system. One inevitable consequence of the adoption of the "bury" was the concentration of the forward lines into a few main routes, thus paving the way for the great reform in policy which was later brought about under the pressure of rather different circumstances.

The induction which resulted from the collection of 20 to 100 circuits in these main corps and divisional routes was reduced to a slight extent by the general substitution of the sounder for the vibrator in forward units<sup>1</sup> and by the elimination of the buzzer as a general means of intercommunication. It was later almost entirely overcome by the adoption of metallic circuits of twisted cable<sup>2</sup> for all forward lines.

Mention should be made of the alternative methods of signalling which underwent their first main period of evolution in 1915. In 1914, the weight and accuracy of modern artillery fire had caused visual signalling to fall into disrepute as being too dangerous. It was soon found, however, that the lines which were at that time the only general alternative to forward visual signalling, were also untrustworthy, and that salvation lay in employing as many alternative means as possible and therefore in improving all available methods as well as evolving new ones. Visual was rehabilitated by the invention of the inconspicuous signalling disc and shutter, by the general adoption of "D.D. D.D." working (signalling from front to rear without reply) and by the adoption of the efficient electric signalling lamp in place of the more conspicuous and noisy Begbie oil lamp which was the standard equipment at the outbreak of war. At the same time the use of pigeons as message-carrying agencies was revived, and wireless telegraphy began to be adapted to forward work. The former were first used by the Intelligence Corps towards the end of 1914, when the British were operating in a district noted for its pigeon fanciers. From this small beginning grew a service which at the Armistice numbered over 20,000 pigeons, while no less than 90,000 men of all arms had been trained to handle the birds. Lofts were kept usually on a line passing about through divisional headquarters and pigeons were forwarded by motor cyclist and taken into the trenches by selected pigeoners. Here they remained until required for use or until 48 hours had elapsed, when they were released with or without messages.

Wireless telegraphy for the forward area was first attempted in the summer of 1915, when experiments were carried out which resulted in the standardization of two types of set, the 120-watt (Wilson) and the 50-watt (British field) set. The former was intended for work at divisional and corps headquarters and consisted of separate transmitting and receiving apparatus. The spark transmitter received its energy from a 26-volt accumulator through a small motor-driven interrupter fitted in the set itself; its original complement was a crystal receiver specially designed for the short waves (350, 450, and 550 metres) on which the forward sets were obliged to work. The 50-watt set, on the other hand, was a combined transmitter and receiver, the transmitting

<sup>1</sup> The two telegraph instruments, the sounder and the vibrator, are worked on entirely different principles. In the former case the currents used rise to their full value very rapidly and then remain steady a comparatively long time. On the vibrator system, on the other hand, the currents used are constantly altering in value and even changing in direction, the vibrations being at an audible rate of frequency (several hundred per second). It is these latter rapidly alternating currents which set up rapidly alternating EMF in the earth surrounding the conductor and provide the ideal conditions for overhearing at a considerable distance. A buzzer is a particular type of instrument using "vibrating" or "alternating" current.

<sup>2</sup> In a telegraph circuit consisting of two wires laid side by side, the electromotive force set up around one conductor will be neutralized by that set up around the other in which the current is travelling in the opposite direction. The most efficient disposition of such neutralizing cables is naturally that where the two halves are most intimately intertuned, as in twisted cable.

portion of which was energized by the current from a 10-volt accumulator. It was intended for work in posts close to the front line and at brigade and battalion headquarters and the complete station with its two 15-foot masts could be carried by a party of three men. Both types of set fulfilled their original purpose admirably. They remained the standard wireless sets for forward infantry command intercommunication purposes throughout the war, and have only gradually been superseded by the continuous-wave wireless sets which are now the standard sets for practically all purposes.

Other wireless sets which were evolved during the war, which owed their invention to the same necessity for indestructible and invisible alternative means of forward intercommunication, were the loop wireless sets. These were sets of short fixed wave-length (66 and 80 metres respectively) which were arranged in two complementary installations—a "forward" and a "rear" station to each set. The forward station was distinguished by the possession of a rectangular aerial of folding tubing which could be erected wholly below the surface of the ground in a deep trench or in a dugout, thus rendering the station invisible and often invulnerable. The rear station had a short wire aerial, much of the type used with the standard "British field" (50-watt) set. It was intended, as its name suggests, for work at places not in the direct observation of the enemy. These sets with slight modifications, remain in use at the present day for intercommunication within the infantry battalion.

At least as important as this evolution of alternative methods was the consolidation and reorganization of the signal service which took place during the years of position warfare.

For the understanding of the present organization of an army signal service some account of the effect of the interaction between the requirements of the general staff and the unfamiliar war conditions experienced in the years 1914-7 is essential. Whereas in the pre-war organization of the signal service the ruling consideration was mobility, a military situation arose within six months of the declaration of war, and continued for three years, in which extended movement was the exception and not the rule. The effect on the signal service was a multiplication of the calls for intercommunication made upon it and at the same time an increase in the unreliability of all means of forward signalling. Work in the danger zone had usually to be done not once but many times; duplication of routes forward, first of brigade, and then of divisional headquarters, became essential. At the same time, the demands of the staffs, of the unit commanders, and especially of the artillery, increased manifold.

An establishment adequate to the demands of mobile warfare could not possibly cope with those of position warfare. The small degree of supervision and absence of coördination, due to the practical autonomy of the signal service within each formation, which had been recognized as drawbacks in the manoeuvre warfare of 1914, became impossible obstacles to efficiency in 1915.

The first reforms which enabled order to be wrought out of the chaos into which forward signals were in danger of falling were—(1) the vesting of the control of all forward signals in the hands of the divisional signal company commander and (2) the assumption by the signal service of responsibility for, and a measure of control over, artillery signals. By this means it proved possible towards the end of 1915 to eliminate unnecessary lines and to insist on the reeling-up of derelict cables. At the same time steps were taken to supplement the obviously inadequate personnel.

The original signal service units of the British Expeditionary Force of 1914 had consisted essentially of (a) the personnel to man one or at most two headquarters offices; (b) sufficient cable or airline detachments to lay one main route to all subordinate formations or units then considered to be entitled to telephone or telegraph; and (c) a few despatch riders, orderlies, and visual signallers. This establishment only just sufficed for the skeleton intercommunication system required in a mobile army, and neither office staff, line-building detachments, nor orderlies, were sufficient to man the greatly swollen system of position warfare. Reinforcements were essential, and not only reinforcements but radical reorganization as well. Much of the personnel required

was for the maintenance of heavily shelled, long divisional and corps lines through the danger area. If these routes were to be efficiently maintained and circuits allotted with due regard to the relative urgency of individual requirements, the men manning them must remain at their posts irrespective of divisional moves. This meant the formation of pools of area-maintenance personnel and units at corps or army headquarters and the creation of these pools was one of the main features of signal reorganization during the position-warfare period. Individual increases to the mobile portions of units also took place, corresponding to changes in signal methods (all in the direction of increased complexity) or alterations in procedure (e.g. the assumption of responsibility for artillery and machine-gun signals) which applied equally in position and in mobile warfare.

The increases in the strength of signal units during the war are indicated by the figures in the annexed table, which gives the strength of the signal personnel in an army of two corps, each of three divisions, in 1914 (when the only equivalent of an army signal company was the G.H.Q. signal company) and in 1918, respectively.

*Strength, 1914, at Mobilization.*

Unit	Each		Total	
	Off	Other Ranks	Off	Other Ranks
G.H.Q. signal company . . . . .	5	75	5	75
Two army corps H.Q. companies . . . . .	4	63	8	126
5 airline sections . . . . .	1	57	5	285
8 cable sections . . . . .	1	35	8	280
6 divisional signal companies . . . . .	5	157	30	942
Total personnel . . . . .			56	1708

*Strength at Armistice, 1918.*

Two corps signal companies . . . . .	6	105	12	210
4 airline sections . . . . .	1	43	4	172
4 cable sections . . . . .	1	34	4	136
Six divisional signal companies . . . . .	15	400	90	2400
Total personnel . . . . .			168	4380

While the above description applies principally to the evolution of organization in the general signal service, some special mention of the alterations which took place in wireless units is necessary, particularly since wireless telegraphy will in all probability play a more dominant part in the intercommunication service of the army of the future. The few wireless sets which were in use in the British Expeditionary Force at the outbreak of war were manned by personnel who were all incorporated in a single "wireless section" which shortly became a "wireless company." The first great increase in the value of army wireless came with its application to intelligence purposes, originally for the simple interception of enemy wireless messages, and then also for the location of enemy wireless sets whether in the field, at sea, or in the air. For this latter use of wireless alone—"position finding"—many special sets were devised and a numerous personnel collected in special intelligence wireless units.

Next, the invention and perfection of the portable "trench" wireless sets in 1915 and 1916 created a further demand for wireless personnel and increased the already swollen establishment of the central "wireless company." The result was a measure of devolution and the formation of an army wireless company in each army. The commanding officer of this unit acted as staff officer for wireless to the chief signal officer of the army, and was

responsible for the organization and practice of wireless within the limits of the army.

Yet another direction in which wireless personnel found employment was in the detection and prevention of the indiscretions which, in 1916 particularly, enabled the enemy to glean important information by listening to the traffic over the British telephone system. It was in 1915 that this menace first became important and in the following year "overhearing" became so serious that the forward telephone service was stifled. Many important results followed, directly, or incidentally. Of these may be mentioned:—

(1) The general adoption of closed metallic circuits everywhere within 3,000 yd. of the front line.

(2) Alterations in the system of identification calls.

(3) The replacement of the buzzer telephone by the fullerphone in the forward area.

(4) The invention of the screening buzzer, a powerful vibrator used for drowning all sounds carried forward by induction from the front line.

(5) The invention and perfection of the 3-valve listening sets and the formation of detachments of the army wireless companies to work them.<sup>1</sup>

(6) The growth of an organization for the interception of speech on enemy lines and the policing of our own telephone system.

(7) The application of earth induction telegraphy to signalling which resulted in the invention and evolution of the power buzzer.

(8) The increased employment of alternative methods of signalling (visual, wireless, etc.) so obviously liable to overhearing or overseeing that they were used with caution.

It is difficult to decide which of the many results was the most important, but perhaps the most interesting from the present point of view was the evolution of the power buzzer. This was a powerful vibrator worked by the current from a 10-volt accumulator, and connected to inconspicuous earths of insulated wire which could, if necessary, be buried 6 ft. deep with little labour. It occupied a place in position-warfare signals for which no other instrument, except perhaps the loop sets which lately more or less superseded it, was suitable. Detachments of troops isolated by the enemy could send out code signals which could be picked up by listening sets, themselves inconspicuous, at ranges up to

a current from the 10-volt battery flows through the key to the upper contact, across to the lower contact, along the armature, thence along the primary coil, and back to the battery. The current magnetizes the coil which attracts the armature, thus breaking the contact, and allowing the armature to fly back and remake contact, etc. Each time the primary current is thus completed and broken, currents in the opposite direction are induced in the secondary coil and are passed to earth through shut lengths of cable and earthpins. Condensers, as shown, are connected across the break to reduce the sparking to a minimum.

To obtain the best results in two-way working a three-valve amplifier (b) is employed. The currents, received on similar earths, pass through the primary circuit, are induced into the secondary of the earth-to-valve transformer which is connected to the grid and, through a single dry cell, to the filament of the first valve. The amplified signal from the first valve passes through the second and third valves and, finally, the three-amplified signal passes through a valve to telephone transformer with ordinary wireless receivers in series with the primary winding.

With all these developments, and especially with the rapid increase in the number of listening sets, the wireless service, as a separate entity, was becoming unwieldy, and its absorption into the general signal service organization was essential to its most efficient administration. In 1917 and 1918, therefore, the army wireless companies were broken up, the section which had composed them being allotted to the divisional, corps, and army signal companies, according as they were equipped with portable trench sets, Wilson and listening sets, or the larger and more powerful Crossley motor sets used for supervisory and tactical work at army headquarters. In this form wireless organization survived the war.

The only change of moment in army wireless after this time was the application of the continuous wave system to army use. The early experimental sets made their appearance in 1917, but for some months they proved to be too delicate and untrustworthy for the work under the hard conditions of active service. Gradually, however, technical difficulties were overcome and more robust types of instrument devised. Before the end of position warfare, portable 30-watt continuous wave sets of about the size and portability of the 50-watt spark sets, but with forward aerials only 4 ft. high and a normal range of 12 m. were doing good work with heavy artillery observation stations. The Armistice in Nov. 1918 found continuous wave wireless still chiefly confined to the artillery, but new and more powerful sets had already been devised and tested. Since that date, spark wireless has been entirely ousted from its former position except for the short-range loop sets—the successors of the power buzzer—which are retained for work within the battalion and similar small units working in the immediate vicinity of the front line. There seems little doubt that in the future development of army signalling, continuous wave wireless is likely to play an all-important part.

While the chief characteristic of the earlier position-warfare period was the evolution of signal implements and the adaptation of signal organization to stationary tactics, it was in the great battles of 1916 and 1917 that signal policy began to crystallize in very definite shape. The first result of the stabilization of the situation was the running forward of lines in all directions to serve the multifarious units which now for the first time made good their claims to telephone communication. Magneto and buzzer telephones and magneto, buzzer, and combined exchanges made their appearance in all formations from brigade rearwards, and buzzer telephones and exchanges were issued to battalions and batteries. The lines to serve these telephones and exchanges had in many cases to be duplicated and even triplicated, and a festoon of lines, converging from front to rear, or stretched transversely and at all angles across the front, hampered movement and defied the utmost efforts of the signal personnel whose business it was to maintain them. The necessity for economizing signal personnel and for the protection of lines alike tended to bring about two reforms. On the one hand, control was vested in the signal officers of superior formations; on the other hand, by their orders, all circuits were concentrated into a certain limited number of well-defined main routes.

The first of these reforms in point both of importance and of time was the rearward movement of the centre of gravity of the

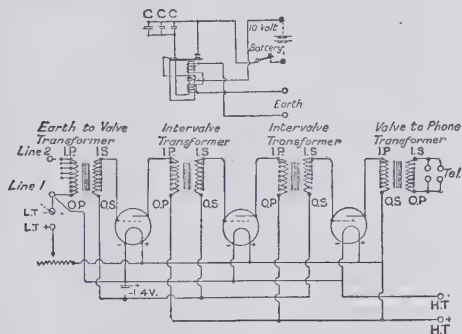

FIG. 1.

3,000 yd. On several occasions of importance these sets remained the only means of communication with and from units that had advanced rapidly in attack, or become isolated in defence.

The diagrams in fig. 1 show the principles of the power buzzer amplifier system. The transmitter (a) is a powerful buzzer taking its current from a 10-volt accumulator. When the Morse key is pressed,

<sup>1</sup> The early overhearing experiments were made with ordinary telephone receivers and results, while they pointed out the danger, were not very satisfactory. In the German, French and British armies, it was the discovery of the possibility of using the new 3-electrode valves for magnifying extremely small changes in electric potential which at the same time raised the "overhearing" menace to its greatest pitch and caused the development of large branches of "Intelligence" and Signals to deal with this new branch of scientific warfare. The valves were used in receiving circuits both as detectors and amplifiers and revolutionized both telephony and wireless telegraphy.

command of forward signals from the uncontrolled battalion, through brigade, division, and corps, to army. Concurrently with this, the commanders of signal units became staff officers—*i.e.*, representatives of the command itself—instead of simple executants.<sup>1</sup>

In the meantime, the idea of the central signal route in each formation having been launched, it was natural that other means of signalling should at once tend to concentrate along these routes, with their protected test-points and signal offices. Economy and greater trustworthiness at once followed, and in the battle of the Somme, 1916, when the British army first carried out a great offensive from prepared positions, the central signal route, running from front to rear of each divisional sector and reinforced with all possible means of intercommunication, was attempted as a definite policy. The line system was carried forward in 6-ft. buries to a cablehead in, or even in advance of, the front line. Cable detachments were organized and held in readiness to extend the lines. Runners and despatch riders were organized in relay posts along the cable route. Wireless and power buzzer sets were also erected in convenient dugouts close to cablehead and the forward communication centres. By this concentration of means along one line, and by an all-round training which made the personnel to some extent interchangeable, economy of personnel, elasticity of procedure, and a minimum of casualties were ensured.

In the more extended offensives of 1917, this principle was carried still further and reinforced by instructions issued by G.H.Q., which required the headquarters of formations to give the signal officers concerned early and detailed information as to projected operations, forbade movements of headquarters without good cause, and laid down other important points of principle.

The culmination of position warfare thus arrived in the spring of 1918 to find the signal service quite equal to the calls made upon it. At G.H.Q. and on the lines of communication were adequate office staffs and a sufficient number of permanent line and airline construction companies and sections. The bases, camps, depots, and stores concerned with the administration and supply of a great army were served by army telegraph and telephone routes. Maintenance parties at all offices dealt with ordinary day-to-day repairs; breakdown gangs at central positions were in readiness to cope with the catastrophic breaks due to bombing and long range shelling. At G.H.Q. itself powerful wireless stations formed the initial link of a chain line which reached right forward to the front line; other stations were engaged in intercepting the German wireless; and a headquarters wireless staff coordinated the activities of the Intelligence stations scattered throughout the rear army zone. Here, also, was the nerve centre of the whole signal service in France—the directorate of signals—the staff which formulated the policy of the service, supervised its organization and working, and allocated the incoming reinforcements of men and material.

The basis of the signal system of the army was again a telegraph and telephone network which was built up on a "chessboard" or "grid" system, that is with front-to-rear routes and routes transverse to the front, spaced at regular intervals and with the main signal offices and test-points at the junction of the two. Until late in 1917 the approved theory was to make the line system approximate as nearly as possible to the perfect "grid" with as few and as heavy routes as possible. With the increase in the amount of long-range shelling and bombing which was a marked feature of early 1918, this principle required considerable modification. Two or three parallel routes usually took the place of the single heavy route of each corps or army area, and all routes were diverted to a much greater extent in order to avoid centres likely to be bombed or shelled.

The constitution and working of the army signal company perhaps more nearly reflected the conditions of position warfare than did that of any other. A telegraph construction company, a light railway signal company, and airline sections were the chief elements of the construction personnel, though there were also cable sections for connecting up isolated units at any time, and dealing with emergency connexions in battle. Here, also, were wireless light motor sections, mainly employed on supervisory duties, but like the G.H.Q.

wireless, available to take their place in the chain of intercommunication in the event of the failure of the lines. Most of the traffic was dealt with by wheatstone, duplex, and simplex telegraphy, and the magneto telephone, wireless telegraphy being chiefly utilized to assist and police the more forward stations. The chief signal officer of the army had also to coordinate the signal schemes of the formations in his army, and under his command were the area detachments whose permanent duty was the maintenance of the buried cable in the army area.

In the area of a corps—the forward position of which was liable to frequent shelling—the main routes were still permanent line and airline and the construction personnel consisted in the main of airline detachments. In addition, corps cable sections were available for emergency cable-laying, for loan to overworked divisions (a frequent case), for artillery signal work, or for running spurs to isolated offices off the main airline routes. The personnel of the corps cable sections was also often employed to supervise labour parties in the construction of the buried cable system, though, as above mentioned, maintenance personnel was provided through the army area detachments. The corps wireless section, while principally concerned with store distribution and supervisory and police duties, was more intimately connected with the tactical employment of wireless than was that of the army. Particularly in battle periods, the corps-directing station was frequently obliged to step in and assist its less powerful subordinates to attract the attention of other stations or to rebuke stations using undue power or contravening priority regulations, besides policing procedure and listening for occasional windfalls from forward German stations.

Lastly, the chief signal officer of the corps had to supervise and control the signal communications of the heavy artillery. For this purpose a special section had been added to his company, but this was altogether inadequate and in practice the whole energy of one corps cable section was usually devoted to the construction and maintenance of artillery lines. These corps units were differentiated in principle from the area detachments by the fact that they possessed sufficient transport to enable them to move forward while continuing their work. In all adaptations of the signal units of formations below army the essential characteristic of mobility was respected. Those elements of the service which required to be specialized to areas were embodied almost entirely in the army company, others being organized so as to be able to move as integers.

This principle of mobility naturally applied with still more force to divisional signal companies. Even when position warfare seemed to be most definitely established the retention of its horse transport by the divisional company was insisted upon, in spite of the extra work entailed by the care of horses upon a personnel fully occupied with its technical work. This insistence had its reward in the long run, for mobility regained all its old importance on March 21 1918 and retained it to the end of the war.

The original divisional signal company in 1914 consisted of the following elements—three "brigade sections" (in principle serving the infantry brigades), each of a telephone detachment and a squad of signallers, a "headquarters section" consisting of a small office staff and a few signallers and despatch riders, and a "No. 1 section" of three cable detachments, each of which was capable of laying 10 m. of cable and carrying three offices. By the spring of 1918 the "headquarters section" had been enlarged in every branch, and "No. 1 section" had been increased to four detachments to cater for the field artillery headquarters; but the "brigade sections," though much overworked, had remained practically unchanged. To these three original elements, however, others had been added. A small section, similar to a "brigade section," was serving with every field artillery brigade in the division. The reorganization of the machine-gun service in Feb. 1918 added another small section to serve the divisional machine-gun unit. The extension of wireless telegraphy to the division had involved the addition of sufficient personnel to man a "Wilson" and three "50-watt" sets and a charging set for accumulators. In addition, men were attached from brigades to man six power buzzers and their corresponding receivers, and to eke out the still undermanned visual detachments.

Forward of battalion headquarters, the direct responsibility of the divisional personnel ceased, and in battalions and batteries, signal communications were built and maintained by regimental signallers. Occasions occurred when the requirements of these units could be accommodated on the central system, but these were exceptional. Usually their signallers were fully occupied with the lines and with visual communication between the front line and their headquarters. The means at their disposal were light cable lines and enamelled wire with D3 buzzer telephones; heliograph, lamp, flag, disc, or shutter; pigeon, messenger dog, message-carrying rocket and runner. In the case of power buzzer, pigeon, and messenger dog, communication was usually roundabout, via brigade, division and even corps headquarters; in the case of other appliances, direct touch from front line to company headquarters and from company to battalion headquarters was the rule.

The most interesting portion of the evolutionary history of signal communication in the war finishes with this period, and the story

<sup>1</sup> Strictly, this applies only to corps and army headquarters, though before the war ended, it was the unofficial practice in most divisions also.

<sup>2</sup> The artillery still used both Morse and semaphore; infantry signallers at this stage of the war were trained in Morse only.

of the remaining months of mobile warfare is that of the reversion to simple skeleton systems, based on the principle of the central route studded at suitable intervals with forward communication centres. No further radical reorganization took effect, the principal change being the gradual switching over from spark to continuous wave wireless for command intercommunication purposes.

(3) *Signals in Theatres of War other than France.*—While the greatest measure of evolution and adaptation naturally took place in the most important field and that nearest to the home sources of supply, almost every one of the outlying British theatres of war presented its special problems and emphasized the need of forethought and careful preparations, in respect of methods, personnel and stores alike, to suit local conditions, for instance in arranging for intimate coöperation with the intercommunication service of the navy in such operations as those of the Dardanelles, and the coastal operations of Sinai and Syria,<sup>1</sup> and in assigning an unusually large part to visual and wireless communications when a considerable water gap has to be spanned, as in the Dardanelles campaign. But perhaps the most significant lesson of experience in these campaigns was the greatly enhanced importance of wireless telegraphy relatively to other means of communication. Wireless plays a predominant part in such operations as those in E., W. and S.W. Africa, or those of the desert mounted corps in Palestine, which are conducted in vast, ill-developed theatres of war by comparatively small forces; for these frequently involve far-flung troop movements in the offensive, and tactical isolation of detachments in the defensive.

The sets in use in the British Expeditionary Forces engaged in outlying theatres were the 3-K.W. lorry set, the 1½-K.W. set mounted on a limbered wagon and drawn by teams of horses, bullocks, mules, or even men; the Marconi pack set, a 0.5-K.W. set either carried in a limbered wagon, on pack horses or mules, or by bearers. The latter proved particularly valuable for work with flying columns of swiftly moving troops. All three types of set were spark sets deriving their energy from internal-combustion engines. In the future, these will doubtless be replaced by the more efficient continuous wave system of wireless, but they played their part well in the 1914-8 campaigns over ranges respectively of 120-100, 80, and 30-50 miles. The extreme case of isolation in the defensive is of course that of a garrison under prolonged siege, and as an example both of the utility of wireless telegraphy in this case and of the actual working output of even a small set, the case of Kut may be quoted. The only means of signalling possessed by the defenders of Kut for some weeks was a small wireless set. By means of this, touch was kept with the relieving forces until the surrender, 6,313 messages consisting of 434,861 words in 144 days being the final record of the set.

One other lesson learnt in the outlying campaigns may be mentioned—the special necessity, in the theatres far from home supply services, for standardization of implements and stores. This had only been partially carried out when the war ended, but since then a considerable reduction has been effected in the number of types of instruments in use.

(4) *Relation to other Arms.*—A subject of considerable importance is the relation between signals and other arms. Before the World War, the signal service was regarded by the general staff as an executive servant and by other elements of the army its existence and potentialities were too often slighted or ignored altogether. As the war went on, the importance of rapid, trustworthy, and copious intercommunication was emphasized more and more. The effect of this, in the gradual change in the status of the formation signal officer from the executive to the staff officer, has already been emphasized as one of the main features of the evolution of the service during the war period. Similarly, the relation of "signals" to intelligence, artillery, and even to infantry, has undergone a distinct change.

The intelligence service of all armies owes no small measure of its present effectiveness to the means provided by signals for tapping sources of enemy information. The listening sets; the position-finding wireless set; the interception wireless set; the

acroplane wireless compass, are all efficient means of making out enemy plans and dispositions. So-called "wireless camouflage"<sup>2</sup> and the dissemination of false information by all means of signalling are well-recognized strategems.

The relation between artillery and the signal service is still more obvious. Efficient artillery fire was never more dependent on good observation than it was in the position-warfare battles of 1915-7, and observation is useless without intercommunication. As has been noted earlier in this article, artillery signal communication has become one of the definite functions of the signal service.

With the infantry, the signal service, through the regimental signal personnel which it supervises, has an equally close connexion, though the personal comradeship which is the basis of true liaison was made difficult, in the war, by the inevitable demands made on infantry labour for the burying of cables.

Signal personnel have frequently proved their ability to give a good account of themselves in infantry fighting, but it cannot be too strongly emphasized that the employment of signallers as infantrymen whether in the battalion, brigade, division, corps, or army, is a mistake except as a very last resource. The signaller is a valuable technical tradesman and he cannot be trained in a few days or even a few months. More casualties have probably been caused by lack of signallers, and therefore of the efficient signal communications essential to the guidance of the battle, than can ever have been saved by their employment in the fighting line.

No small amount of the attention of signal units, especially in position warfare, is now devoted to serving the needs of other technical branches of the army. Tank corps, royal air force, and survey battalions all made special demands upon the intercommunication service.

(5) *Means of Intercommunication.*—Details of the means of intercommunication employed by the British army signal service will be found in the official Manual of the Corps of Signals, Parts I., III., IV., and V. Some of the details of more general interest are given in the following few paragraphs.

*Telephone and Telegraph.*—The standard instruments in use are the telephone No. 110 (magneto ringing), the fullerphone (buzzer call) and the telephone D Mk. III. (buzzer call). (In addition, a lineman's telephone is provided for the use of the intercommunication maintenance personnel which has both magneto ring and buzzer call.) Of the telephones, no special description is needed, their only peculiarity characteristic being a robustness of structure and parts calculated to stand the rough usage of army life.

FIG. 2.

The fullerphone is an instrument of peculiar interest. The chief cause of the leakage from telegraph and telephone circuits was the electrical stresses set up within the earth by the rapidly alternating current used. The fullerphone is a telegraph instrument, the essential point of which is the changing at the receiving end of a steady current into an intermittent current of audible frequency, while at the same time the current in the line remains steady. A typical fullerphone receiving circuit is shown in fig. 2. The interrupter (X) may be driven by any means, either electrical or mechanical. In army patterns it is driven electrically, being operated by means of a local cell.

If a steady E.M.F. is applied between line and earth and the circuit is closed at the interrupter, a steady current will pass through the choke coils (C1, C2), contact 2 and receiver. If the circuit is broken at X the current cannot pass through the receiver but will flow into the condensers (K1, K2, K3). When the circuit is again closed at X the condensers partially discharge through the receiver.

When the interrupter is working we therefore get an intermittent current in the receiver which can be made audible by adjusting the interrupter to run at a suitable speed, while the line current alternately runs into the condensers or through the receivers and remains practically constant and continuous in the line. The dots and dashes sent by the single current Morse key at the end of the line

<sup>1</sup> It was doubtless owing largely to the experience of these campaigns that steps were taken towards the end of the war to harmonize the signal procedure of the navy, the army and the post-office, that is, the form and manner of sending messages, the checks in accuracy, the ensuring of priority, and suchlike matters of technical detail that, in fact, are as important to efficiency as the design of instruments and the principles observed in their employment.

<sup>2</sup> Manipulating the technicalities and the volume of traffic of one's own wireless so as to mislead the enemy's interception service.

are therefore reproduced in the receiver as short or long notes. Readable signals can be obtained with about half a microampere, a main battery of one dry cell being sufficient. The employment of such an extremely small continuous line current eliminates danger of overheating, induction being reduced to a minimum.

In the rear areas, simplex, duplex, and wheatstone telegraphy are all used in the offices of the higher formations, which in the case of the armies may contain several hundred telegraph instruments and telephone subscribers. Magneto exchanges are the rule as far forward as brigade headquarters. At brigade headquarters buzzer exchanges are also installed and at battery and battalion headquarters buzzer exchanges are the rule. Circuits are of galvanized iron or copper wire beyond the limits of frequent shelling. Forward of this, main routes are of buried armoured cable (2-, 4-, or 7-pair brass-sheathed or iron-armoured usually) or light field cables which are standardized in several sizes in both single and twisted twin circuits. Enamelled wire, that is, wire roughly insulated by a coating of enamel, was used by forward troops during the war, but is now obsolete.

**Wireless Telegraphy and Telephony.**—In all formations down to infantry battalions continuous wave wireless is now practically the only means used. There are three standard sets. For use at, or in rear of, army headquarters, or for long distances in mobile campaigns, a set is provided with a maximum range of 400 miles. The set has two 70-foot masts and is fitted to be carried either in a box car or a limbered wagon. (This is the equivalent of the former "heavy motor set.")

For distances up to 200 m. a smaller set is provided which has two 40-ft. masts and can be carried as above or on pack animals. For divisional work, the old "Wilson" and "British Field spark" sets have been replaced by a portable set with a range of 12 miles. This has two 15-ft. masts, is worked from accumulators or by a hand generator, and carried on pack animals or by bearers.

Finally, the loop sets already mentioned earlier are retained for work within the battalion and battery if required, though they are likely to be replaced soon by short range and short wave C.W. sets of much greater efficiency. The power buzzer and 3-valve amplifier sets are also available for issue in case of position warfare.

Small portable wireless telephone sets for forward work have been devised, and similar sets were indeed used in the Air Force during the last months of the war. The sets are not yet standardized, but those in use have a range of some 2,000 to 3,000 yards.

**Visual Telegraphy.**—The visual instruments include the heliograph as used in pre-war days (see 13.223); the Lucas lamp; the shutter, and the flag. Of these, the heliograph has a range up to 100 m. or more, but only of really extended use in a country with a large proportion of sunlight.

The very efficient and portable Lucas lamp is a powerful electric lamp with an 8-candle-power bulb set in the back of a cylindrical lampholder with a powerful reflector at its back. An 8-cell battery of ever-ready cells provides a current at an E.M.F. of 12 volts. The lamp has a range in daylight of 2 m. with the naked eye and 3 to 4 m. with the telescope, and at night of 6 m. with the naked eye and twice that distance with the telescope.

The signalling shutter is also a development of the position-warfare phase of the war. It consists of three flaps of American cloth which are black on one side and white on the other. At the back of the shutter are metal clips by which the device can be attached to an ordinary bayonet. The flaps are normally closed with the black side outmost, but by pulling on the operating cord they are pulled down and the white exposed. On releasing the cord the flaps spring back to their original position. When not in use the instrument can be rolled up and stowed in a canvas case.

**Message-carrying Agencies.**—Of these the most important are (a) despatch riders, mounted orderlies, or runners; (b) carrier pigeons; (c) message-carrying rockets; (d) dogs; (e) air craft.

(a) For use in rear of brigade headquarters the motor cyclist despatch rider is invaluable. A feature of the modern signal service is the organized D.R.L.S. which deals with all official correspondence too urgent for post and not sufficiently urgent for the telegraph. Within brigades, divisions, and in cavalry units and formations, mounted orderlies are often used for conveying messages and this is true of all formations in country impassable to motor cyclists. In the forward battle zone the runner is the last resource of the forward commander. His use should, however, be restricted to occasions when all other means of signalling have failed or are unreliable, for casualties amongst runners are many and men suitable for this duty are not too common.

(b) The pigeon has proved its value for position-warfare conditions during the war. The pigeon service is controlled from corps headquarters and messages from the trenches will usually reach the battalion via brigade or divisional headquarters. The employment of pigeons with tanks and artillery is an important branch of the pigeon service. New developments are their delivery to isolated or front-line posts by aeroplane and parachute, and the teaching of pigeons to fly by night. In the latter case the birds are kept in red light and are flown to a loft where the trap is illuminated by a powerful arc or acetylene light.

(c) Message-carrying rockets with a range of 2,300 yd. have been adopted as a standard means of signalling. Their course through

the air is outlined by a trail of smoke and their position at the end of their flight by a coloured flare automatically lighted at the moment of impact with the ground.

(d) The use of the messenger dog is likely to be confined to position warfare. These dogs have done good service on occasion, but are likely to find their vocation only in stationary warfare or during a very methodical deployment for battle.

(e) In certain phases of a battle the aeroplane is the only trustworthy or even possible intermediary between troops and command. Apart from wireless telegraphy, messages can be communicated to the aeroplane by visual signalling, or if of a simple conventional character, by means of the ground panels used for the notification of positions, while, from the aeroplane to the ground, the most secure method yet discovered is to drop a written message, provided with long streamers, on to selected "dropping grounds" contiguous to the headquarters concerned.

**Notification Signals.**—Light and smoke signals are made use of as occasion directs and a plentiful supply will be held in store. These are used, under prearranged schemes, for such purposes as calling for barrage or protective fire; notifying positions of forward troops; answering one-way messages, etc. The manufacture of distinctive flares, and light signals generally, has been carried to a very high degree of perfection.

Acoustic signals have not been generally successful with the exception of the Klaxon horn in aircraft. Special sirens and horns for calling attention to gas attacks and other general alarms have been much used, but an attempt made by the French to signal by means of tuned acoustic horns was not very successful. The noises of a modern battle are such as to handicap this method of conveying information very greatly.

(6) **The French Signal Service.**—The French intercommunication service at the outbreak of war differed from the British in being in two separate compartments—a telephone system controlled by the engineers, and a runner and despatch rider service under entirely separate direction. In addition there existed a motor service with the maintenance of liaison between units as its chief duty. The absence of the telegraph in forward formations threw much extra work on the remaining personnel, and caused a consequent increase in the proportion of despatch riders, runners, and orderlies. Construction personnel was in the main kept in the rear and sent forward only when actually required, according to exigencies.

The greatest reliance was placed upon the ringing telephone even in the forward area, and this statement is true even for 1918, although time and again the forward telephone system had been swept away in hopeless ruin by the bombardments which preceded the great position battles. In the rear, the very complete telephone network with an excellent system of locality exchanges served all purposes very well, whether in the normal stationary warfare, in the pressure of traffic before or during an attack from a trench system, or in the hurry of an advance or retreat on a considerable scale. In the last-named case as the attacking armies very soon outran the major portion of their heavy artillery, these well-built lines stood well, and the French system of locality exchanges served the retreating divisions as well as it had served the corps and armies for which it had been originally built.

In the forward area the French signal service was faced with a somewhat different problem from that which confronted the British. Serving a professional staff and a conscript army, far more accustomed to mass manoeuvres than the British armies, a relatively far greater proportion of attention could be paid to getting back information from the front than orders forward to the front. The absence of the telegraph had also taught the forward staffs to rely more upon the spoken word and to dispense to a great extent with those written explanations and confirmations of orders which were considered essential to the British staff procedure.

The British subordinate commander was often able to act upon his own initiative; his French equivalent was not only able but expected to do so to a much greater degree. The result was a far greater use of one-way working, and to this was perhaps due the fact that the power buzzer—essentially a one-way instrument—was first developed in the French army.

A further feature as regards signal policy and practice was a tendency to confine forward routes to front-to-rear routes only. All lateral liaison was by liaison officers, despatch riders, or runners. When a British division was working next the French, the position always involved responsibility for two lateral routes

instead of one.<sup>1</sup> Not only did the French not employ lateral lines, but it was only under suasion that they would make use of them when provided.

The front-to-rear forward routes were mainly of buried cable, though shallow splinter-proof and traffic-proof trenches and narrow open trenches were also employed. "Comic" airline, that is airline built with improvised poles and other stores, which was an invention of the British army, was also adopted by the French, but the latter placed more reliance on fairly heavy routes of poled cable, especially of 7 or 8 cables slung together on pickets 3 to 4 ft. high, a method seldom employed in British divisions except when working in French areas, but which proved very satisfactory when used by a British corps in the advance from the Marne in July 1918.

A further divergence of practice was the concentration upon continuous wave wireless to the exclusion of spark wireless for forward command purposes which was the outstanding characteristic of the forward French wireless service. In 1918, continuous wave wireless was used for command purposes in armies, corps, and divisions and the wireless system achieved a considerable measure of success in the final advances of the autumn. This was the logical outcome of the fact that, on the Allied side, the French were through-out the pioneers of the development of the 3-electrode valve and its application to practical war problems. In no army were the research departments of the signal service keener or better directed. The chief triumph achieved was the designing of such a valve of a much more robust type than any previously produced. This valve, known as the "French" valve, became the standard equipment for the majority of the forward wireless and listening sets both in the French and British armies. (R. E. P.)

(7) *The German Signal Service.*—In the German army before 1914 the signal service formed part of the "Communication Troops" (*Verkehrstruppen*) which had been separated from the engineers for some years. Six Prussian, one Saxon and two Bavarian telegraph battalions existed, and these units, as well as the regimental signal personnel, were trained principally in the buzzer telephone. Wireless telegraphy was provided for by separate detachments, in principle destined for G.I.F.Q., army headquarters, cavalry formations, and important fortresses. The only other means in use by the signal service of the field army of 1914 was the visual apparatus (*Blinkgerät*), but this was not regarded as having any value in battle, for which the intention was to depend on good tactical and technical handling of the telephones. The strength of the signal service in peace was about 8,500, increased on mobilization to 26,000, and at its maximum in the winter of 1917-8 the establishment reached 192,000. This was nearly an eightfold increase in numbers, but as the number of formations provided with signal units had itself increased, it is more instructive to compare the signal personnel of an army of given strength in 1914 and 1917-8. In the former year, a German army of 12 divisions had about 1,900 signal personnel, and in the latter (nominally) some 9,300. Comparison of these figures with those given above for a British army of 6 divisions in 1914 and in 1918 shows that the German army was at the outset less well-provided than the British, as was indeed to be expected from the long tradition of colonial wars of the latter. At the end of the World War, however, the German signals were, nominally, slightly superior in numbers to the British, though in practice, as the German system assigned to signals certain duties that were not so assigned in the British organization, the strengths—or rather establishments—were about equal for a given force.<sup>2</sup>

In the first German operations in the western theatre in 1914, intercommunication was in principle by the telephones of the signal service from supreme command to brigade headquarters and by the telephones of the regimental signalling sections (at first, eight men per battalion) farther forward. The flag was also in use, but, as in the British service, it soon disappeared when tested by war. Between the supreme command and armies and cavalry formations, wireless telegraphy—especially in the later stages of the advance to the Marne, when the army telephone detachments failed to keep up with the march—was the principal means of communication and was supplemented by missions of staff officers carried in motor cars. It is admitted by all German critics that this liaison proved far too loose, and its defects are considered to have contributed very largely (some say, principally) to the defeat of the Marne. The for-

ward telephones, on the other hand, in corps signal and in regimental charge, met the demands made on them, to the surprise, it appears, of the army generally, which at the outset had little faith in the utility of technical aids on the battlefield and believed the runner or despatch rider to be the only really trustworthy means of intercommunication. The reconnoitring cavalry was particularly well equipped with telephones, and used a light wire, enamelled to give some degree of insulation to the line in wet weather.

Common to all branches of the intercommunication service was the principle of building from front to rear. Army detachments were responsible for making connexion with the supreme command, corps detachments with army headquarters, and so on. The western campaign of Aug. and Sept. 1914 demonstrated almost at once that this principle was unsound, but only after the penalty for imperfect liaison had been paid.

In the eastern campaigns of 1914-5, and to some extent also in the Rumanian campaign of 1916, conditions imposed upon the Germans radical departures from pre-war regulations. Firstly, the signal units of Hindenburg's armies of 1914 were largely improvised, like many other services and even combatant troops in the East. Secondly, the sparseness of communications and the difficulty of movement compelled the German command from the first to manipulate its signal resources in accordance with the operations in hand or in prospect instead of attempting a schematic layout of lines to all formations alike. Thirdly, the initial mobile warfare conditions continued in the East for more than a year of constant campaigning, and at a later stage, the Rumanian campaign came to prevent the lessons of open warfare from being forgotten. Lastly, the operations began on friendly territory and the policy of the signal service was to build forward from the home telegraph system. These conditions led to (a) enhanced importance of wireless telegraphy, (b) economy of cable, and the use of airline close up to the front, (c) the return to telegraphy for work in rear of corps and even division headquarters, and consequently the development of quick-writing telegraph instruments,<sup>3</sup> and (d) the principle of concentrating both wire and wireless communication on a central route connecting a headquarters with a forward report centre (*Meldeköpfe*, report-head) in the region of the advanced guard, a principle which, for quite different reasons, came into honour later on the western front. The importance of wireless was again emphasized in the Balkan campaign of 1915 and the Rumanian campaign of the following year, in which also the visual apparatus rendered good service.

In the position-warfare campaigns of the West, evolution—speaking very generally—followed the same course on the German side as on the British, similar difficulties and problems naturally suggesting similar remedies. It has already been noted that the numerical growth of the signal service in relation to other arms was approximately the same in the two armies. As regards organization, an important difference was that on the German side the basis of classification was, to the end, the instrument used and not the formation served. Although the signal service branches were combined in one corps of *Nachrichtentruppen* in May 1917, this was subdivided at all échelons into telephone units, wireless units, and visual units. The first-named were responsible for telephones and telegraphs (the latter being largely employed from division headquarters rearward), the wireless detachments for wireless of all kinds and power buzzers, and the visual detachments for the *Blinkgerät*. Moreover, the listening sets, the pigeons and the dogs, were all organized administratively as separate sections of the corps. But in each headquarters, from supreme command to divisions inclusive, the *Nachrichtenkommandeur* was a member of the formation staff and was responsible not only for the command of his own units but also for communication arrangements and procedure generally within the formation, including regimental signallers of infantry, cavalry and artillery, in his capacity as a staff officer. The control and manning of aircraft wireless stations was also in the hands of the signal service, as well as wireless police and wireless intelligence, and (again in his capacity as a staff officer) the divisional signal commander performed many functions that in a British division were assigned to the intelligence officer.

The possibility of applying the recently discovered "audion," or 3-electrode valve, to the purpose of overhearing the opponent's telephone conversations was first realized by the Germans, and the success of this innovation may be said to have revolutionized signal practice on both sides during the war. It made closed metallic circuits in the forward lines and strict telephone discipline essential, and, further, from the listening set there came the "earth telegraph" (power buzzer) which played so important a part in the signalling of all armies in the last two years of the war. But, quite as important as these applications of the 3-electrode valve was its effect on wireless telegraphy through the air. It made possible the change from the spark to the continuous wave system, by providing (a) an intensifier for small, weak receivers such as those of trench and aeroplane sets, and (b) the means of very sharp tuning which allowed of many sets being employed together in a restricted area without mutual interference. Satisfactory trench wireless apparatus on the continuous wave system was designed in 1915 and used in

<sup>1</sup> With British formations amongst themselves the convention was for each to open and to maintain communication with its left-hand neighbour.

<sup>2</sup> Throughout this comparison, regimental signalling personnel is ignored.

<sup>3</sup> The Siemens *Schnellferschreiber* is said to be capable of dealing with 1,000 letters a minute.

the battle of Verdun in April 1916.<sup>1</sup> A further development, made necessary by the adoption of elastic defence tactics in lieu of holding defined trench lines, was the so-called "shellhole" set, which comprised aerial, receiver, transmitter and source of power in a unit weighing only 40 pounds. In elastic defence the visual apparatus also played a useful part.

In trench warfare proper, the Germans did not employ buried cable to the same extent as the British. Their remedy for constant cutting of lines was to put the cables in open trenches sufficiently deep to save them from traffic, and to devote the greater part of the available labour to providing thorough protection for offices, and especially for repair squads. Cable-throwing mortars and messenger dogs carrying reels of self-unwinding cable were occasionally employed to lay lines in conditions of special difficulty. An apparatus known as the "Utel," analogous to the British *fullerphone*, was evolved to meet the overhearing danger. The visual *Blinkergrät*, message-carrying projectiles and rockets, and especially pigeons, were used to supplement the telephone and the wireless communications, as in the armies of the Entente. Unexpectedly good results were obtained with messenger dogs, powerful and intelligent wolflike animals, specially trained and carefully bred.

For the great offensive battle of March 21 1918, the experiences both of the eastern and the western fronts were drawn upon. Between army and corps headquarters, and also between corps and division, the principle of the central route with a *Meldehoff*, to which all forward units made their connexion, was adopted. For the forward units special arrangements were made for transport and routes over the shellhole area. The wireless units were reorganized to permit of great subdivision, and the divisional wireless troop was equipped with its own transport. Visual apparatus was similarly made mobile and self-supporting, and a system of light, smoke, and other recognition signals completed the preparation for battle. In spite of losses and friction telephonic communication was successfully kept up as far forward as regimental headquarters during the first days of the offensive. Thereafter, however, the telephone system broke down owing to the inability of the sections to maintain their lines against the enemy's shell fire and even more the ceaseless movement of transport in the ever-deepening battle zone. Pigeons, even, could finally only be got to the front units by means of aeroplanes. Earth telegraphy failed for want of range; message-carrying projectiles and dogs for the same reason were only occasionally useful, and in the later rapid stages of the advance intercommunication from front to rear depended almost entirely upon wireless telegraphy and upon simple notification signals (such as panels shown to aircraft, light and smoke signals of agreed meaning) in the hands of the troops themselves. The wireless system was based on the divisional central route, which was maintained by powerful units, each alternately keeping up communication between *Meldehoff* and headquarters and moving forward to a new, more advanced *Meldehoff*. The small wireless sets distributed in the front zone, the other reporting agencies, and the staffs, made their connexion with the head of this extending route wherever it happened to be at any moment, while the telephone units, largely reinforced by fresh units hitherto reserved at the disposal of the supreme command and aided by captured material, followed on with airline. This system served its purpose, and the efforts of the signal service were rewarded by special mention in the *communiqué* of March 26, but normal signal traffic did not become possible again till the advance had slowed down sufficiently to enable the telephone units to catch it up.

In their rearward signal communications, the Germans made much use of Pupa coils to bring their iron wire (adopted from motives of economy) up to the technical efficiency of copper wire, and also to increase the efficiency of the latter for long distance telephony. Direct telephonic communication between the German and the Turkish supreme commands was opened in 1917. The use of quick-writing telegraph instruments has already been alluded to.

(C. F. A.)

(8) *United States Army*.—In the United States army, the signal corps has been a separate organization for many years. The units into which it was organized in 1917-8, apart from those serving in the "S.O.S." or lines of communication in France, were of two main classes, field signal battalions and telegraph battalions. To an army were assigned two telegraph battalions and one field signal battalion; to each corps were assigned one telegraph battalion and one field signal battalion; and to each division, one field signal battalion. The telegraph battalions consisted of two companies each, while the field signal battalions each consisted of three companies, a wire company, a radio company, and an outpost company, the latter battalions including 470 men. The outpost company was responsible for commu-

nication at and in advance of infantry brigade headquarters working in four regimental sections in position warfare and in two brigade sections in mobile warfare. The radio company was equipped for all types of radio communication within the divisional area. The wire company constructed and operated the normal system of communications between the division headquarters and the artillery headquarters between the former and infantry regimental headquarters. The corps and army signal units were responsible for maintaining and operating lines forward to the next subordinate headquarters and to certain troops of their own respective headquarters.<sup>2</sup>

A distinct feature of the work of the United States army signal corps was the tendency for the preponderate use of the telephone over the telegraph and the very full and wide provision of telephone facilities. This characteristic is due to the fact that in the United States, the telephone organization is highly developed and the "telephone habit" wide-spread amongst all classes. Hence there would be a wider demand for such facilities, a greater familiarity in operating under circumstances of heavy traffic, and a greater manufacturing capacity for producing telephone equipment, than in the case of other countries.

The signal corps also included the meteorological, the pigeon and the radio direction-finding service and, until late in the war, the aviation service of the United States army.

**SILESIA, UPPER.**—It was provided in 1919 by the Peace of Versailles (Art. 88) that the inhabitants of Upper Silesia (pop. in 1919, 2,280,902) should be called upon to decide by a plebiscite whether they would belong to Germany or Poland (see PEACE CONFERENCE). It should be noted that for the purpose of the plebiscite the purely German districts of Falkenberg (pop. 37,526), Grotthau (pop. 40,610), Neisse (pop. 7,781), part of Neustadt (pop. 25,000) and Hultschin (pop. 45,552), situated in the northern and western parts of Upper Silesia and representing a total population of about 156,469, were excluded. Up to the day of the plebiscite the supreme authority in the plebiscitary area was to be vested in an Inter-Allied Commission, consisting of one representative of France, Great Britain and Italy respectively. In this commission France was represented by Gen. Lerond, England by Col. Percival, and Italy by Gen. de Marini. On Feb. 1 1920 Allied troops occupied the plebiscitary district. The local German officials were then subordinated to the Inter-Allied authorities. The German police (*Sicherheitspolizei*) was replaced by a special polling police (*Abstimmungspolizei*), which was composed half of German-speaking, half of Polish-speaking, Upper Silesians.

On the whole the collaboration of the Inter-Allied control and the German officials proved satisfactory; but various differences arose, such as that which led to a strike of judges in May 1920. Both the Poles (under Korfanty) and the Germans opened an active canvassing campaign; and under Polish pressure the Germans in the southern and eastern districts were subjected to oppressive treatment. On Aug. 19 1920 the Poles felt strong enough, indeed, to make an attempt to seize the country by force. On all sides bands of Poles, chiefly recruited from Congress Poland, usurped authority. A number of Germans were forcibly carried across the frontier into Poland, and many were killed. Several weeks elapsed before it was possible to quell this rising and restore order. In the autumn of 1920 there was an exchange of notes between Germany and the Entente relating to the manner in which the plebiscite should be taken. It had been suggested by the Entente that the non-resident Upper Silesians of the German Reich should vote outside Upper Silesia, at Cologne. Germany protested against this, and her protest was recognized as valid by the Entente. In Jan. 1921 the date of the plebiscite was fixed for March 20 1921. An immediate revival took place in the use of terrorism by the Poles, especially in the districts of Rybnik, Pless, Kattowitz and Beuthen. It reached its climax in the days preceding the plebiscite. Voters from other parts of the German Reich were frequently refused admission to

<sup>1</sup> The experiment was very successful, but the higher authorities for some time refused to allow the general adoption of trench wireless on the ground that it involved a reduction of infantry strength. But a stronger motive was no doubt the fear of interception.

<sup>2</sup> In comparing the strength of these organizations with those of other armies, it must be remembered that the United States army division was much stronger than the corresponding unit of other armies. It comprised two infantry brigades each of two 3-battalion regiments and one artillery brigade of two field and one medium artillery regiments besides other divisional troops.

the polls; sometimes they were maltreated and even in some instances murdered; and houses where outvoters were staying were set on fire. The day of the plebiscite passed, however, without disturbance except at a few places, such as Rybnik and Pless.

The day after the plebiscite the Polish excesses recommenced, and from that date onwards continued without interruption; nor was the Inter-Allied Commission able as a rule to prevent them. The poll showed 717,122 votes for Germany and 483,514 for Poland. In 664 districts there was a German, in 597 a Polish majority. Practically all the towns voted for Germany. There was a Polish majority in the following administrative districts—Rybnik, Pless, Beuthen, Tarnowitz and Gross-Strehlitz. The decision of the Inter-Allied Commission as to the allocation of the disputed regions to Germany or to Poland was delayed on account of differences which arose within the commission itself; the French representative, Lerond, who had from the first been accused of tacitly supporting the Poles, wished to allot the whole of southern and eastern Upper Silesia to them, while the English and Italian representatives wished to apportion the industrial region to Germany. Protracted diplomatic negotiations between Paris, London and Rome did not lead to any result. At the end of April a report became current that the Council of Ambassadors at Paris had determined to give only the districts of Rybnik and Pless to Poland. In consequence of this rumour the first days of May witnessed a new Polish insurrection which assumed far greater proportions than the former one. Korfanty had secretly raised a well-organized Polish force which was provided with arms and munition from across the frontier, and was reinforced by large bodies of men from Poland. With these troops he occupied the whole south-eastern part of Upper Silesia, on a line extending from the S. of the district of Kreuzburg through Gross-Strehlitz to the Oder in the south. He nominated himself dictator of the districts under Polish occupation, took over the administration, and treated even the Allied officials with such scant consideration that they were obliged to withdraw to Oppeln and the regions that were not occupied by the Poles. It was only in the larger towns, where there was a German majority, that the Allied troops, supported by the German population were able to maintain themselves. A further advance on the part of the Poles was prevented by the German Defence Force (*Selbstschutz*) under Gen. Höfer, which was composed of Upper Silesians and Germans who poured in from other parts of the Reich. There was severe fighting between the German Defence Force and the Poles, especially in the districts of Ratibor and Gross-Strehlitz. Colonel Percival, the British representative, was obliged to resign owing to ill-health, and was succeeded by Sir Harold Stuart. Attempts on the part of the Inter-Allied Commission to put an end to the insurrection by negotiations with Korfanty were unsuccessful, and the Allies were compelled to despatch reinforcements of French and British troops, under the command of Gen. Heneker, to Upper Silesia. After lengthy negotiations with the German Defence Force, which refused to withdraw unless guarantees were secured that the Poles would first quit the field, an agreement was ultimately effected with regard to the evacuation. By June 20 the British troops had again occupied the larger towns, while the Poles had the upper hand in the rural districts. As a result of the difficulties in paying his men and providing them with food Korfanty now lost control over his followers. Independent bands were formed which plundered the villages, ill-treated the Germans, and murdered many of them. In the industrial districts work in many of the mines and iron works came to a standstill, because imports of raw material and exports of coal had become impossible. By the end of June the loss suffered by the industrial region was estimated at 3 milliard marks; and there seemed to be no prospect of the restoration of tranquility.

The French adhered to their contention that the greater part of the industrial region should be assigned to Poland. Great Britain, on the other hand, firmly maintained the view that such a partition would, as Mr. Lloyd George publicly expressed it, be "unfair" to Germany on the basis of the Treaty of Versailles and the result of the plebiscite. There were at one time three

rival proposals for partition: (a) the Korfanty line, the extreme Polish demand; (b) the Sforza line, a proposal put forward by the then Italian Foreign Minister; (c) and the British proposal giving Poland only the south-eastern corner with the towns and districts of Pless and Rybnik. France was ultimately left in a minority of one on the Supreme Council, Italy and Japan having adhered to the British view. After prolonged debates and open differences among the principal Allied Powers on the subject of the partition, it was at last arranged, at a Paris conference in Aug. 1921, that the solution should be entrusted to a Commission of the Council of the League of Nations. This commission was ultimately constituted by the representatives of Japan, Brazil, China, Spain and Belgium, with the Japanese representative, Baron Ishii, as chairman. (C. K.\*)

On Oct. 20 1921, the text was published of the documents containing the award of the League of Nations on the partition

Upper Silesia Frontier, 1921

of Upper Silesia. The proposed new frontier line between Germany and Poland was as shown by the appended Map. The division here made in the industrial area, previously German, was such that the Council of the League of Nations declared it to be desirable, however, that measures should be taken to guarantee the continuity of the economic life of the region during a provisional period of readjustment, and to provide for the protection of minorities. It was recommended, therefore, that a general convention for this purpose should be concluded between Germany and Poland, so as to place Upper Silesia under a special regime during the transitional period, and that an "Upper Silesian Mixed Commission" should be set up as an advisory body, composed of an equal number of Germans and Poles, with a president of some other nationality to be designated by the Council of the League, together with an arbitral tribunal for settling private disputes occasioned by the temporary measures.

The provisional or transitional period was to be 15 years, and certain stipulations were laid down by the League of Nations for the economic arrangements during that period in the "plebiscite area." (1) Railway and tramway systems, privately owned or municipal, were to continue under the terms of their concessions, and the German State railways were to be put under a joint system of operation. Railway rates were to be uniform. The State insurance of employees in the Silesian railway system was to be undertaken by that system. A single Accounts Office was to be set up for the whole system. Expenses of new construction to be charged to a separate account, and borne by the State in whose territory it was carried out; the working capital for operation to be

lent by the German State, and interest charged to the account of this system; profits or deficits to be divided between the two countries in proportion to the length of line and amount of traffic belonging to each. (2) The German mark was to be the only legal unit of currency, and Poland was to recognize the rights of the Reichsbank, for a period not exceeding 15 years, but by agreement the two Governments might modify this arrangement earlier. (3) While the German monetary system was maintained in the Polish zone, the postal telegraph and telephone charges should be in German currency. (4) The customs frontier would coincide with the political frontier, and the German and Polish customs law would apply, with certain exceptions. For 6 months, incoming goods from other countries, on which German or Polish duties had been paid previously to the partition, should cross the frontier without duty. For 15 years, natural products originating or coming from one of the two zones of the plebiscite area and destined for consumption in the other should cross the frontier free of duty. For six months, raw, half-manufactured and unfinished products of industrial establishments in one zone, destined for industrial establishments in the other, should cross free of duty; and this should continue for 15 years when the products, as finished, were intended for free importation into the country of origin. Natural or manufactured products originating in the Polish zone should, on importation into the German customs territory, be exempt from duty for three years from the date of the frontier-delineation. As regards export, the two countries should facilitate for 15 years the export of such products as were indispensable for industry in either zone. (5) Poland was to permit, for 15 years, the exportation to Germany of the products of the coal mines in the Polish zone, and Germany similarly to Poland in respect of the mines in the German zone. (6) For the 15 years, any inhabitant regularly domiciled or occupied in the plebiscite area should receive a "circulation permit" free of payment, enabling him to cross the frontier without other formalities. (7) Generally, the two countries should respect private rights.

**SILVER** (see 25.112).—Few subjects of economic importance present such a phase of the mysterious as silver, and the reason for this is perhaps not difficult to understand. In the case of the world's crops, not only are up-to-date and approximately reliable statistics daily available from the countries of production, but the countries of consumption see to it that they equally are in the foreground as to the daily progress of world's crops; and the manner in which statistics relating to these all-important subjects are now presented to consuming markets has become quite an art. For some reason the same attention unfortunately has not hitherto been—and is not even now—paid to the production of silver. Most excellent statistics are presented annually by the U.S. Director of the Mint, by the Government of India, and in pre-war days by the German *Metallgesellschaft*, but these unfortunately are what we may term "post date" figures, and, whilst of great value in informing the student as to what has been, they do not tell us what is going on at any given period.

This state of affairs is no doubt due to the great difficulty which has always been experienced in obtaining definite and conclusive data as to the production of silver, owing to the fact that the metal is now chiefly obtained as a by-product and not from mines worked solely for silver itself. Generally speaking the most important metals with which silver is associated are—gold, copper, lead and zinc. Gold and silver invariably occur together. Lead and zinc usually accompany one another, and the ores carrying these two metals—particularly where lead predominates—are frequently fairly rich in silver. Lead and silver usually form an especially marked combination, whilst copper is frequently associated with both gold and silver. These ores are generally described as silver lead, silver lead zinc, silver zinc and gold silver ores, and the mines producing these ores are not uncommonly spoken of as silver mines, overlooking the fact that the ores of the base metal have to be treated by smelting methods before the silver can be extracted. The quantity obtained in these ores ranges from about 2 to 50 oz. to the ton.

The production of silver, therefore, may now be said to be dependent upon that of gold, copper, lead and zinc; and consequently any causes which affect the production of these metals largely affects the production of silver as a by-product, and the world's demands for these metals will in a great measure control the future supplies of silver. Estimates from what are considered good sources give the percentage of the world's production of silver as ranging from 70% from base metal ores and 30% from precious metal ores.

Table 1.—World's Production, 1860-1919.

Year	Fine oz.	Year	Fine oz.
1860	29,095,428	1890	126,095,062
1861	35,401,972	1891	137,170,000
1862	35,401,972	1892	153,151,762
1863	35,401,972	1893	165,472,621
1864	35,401,972	1894	164,610,394
1865	35,401,972	1895	167,500,960
1866	43,051,583	1896	157,061,370
1867	43,051,583	1897	160,421,082
1868	43,051,583	1898	160,055,253
1869	43,051,583	1899	168,337,452
1870	43,051,583	1900	173,591,304
1871	63,317,014	1901	173,011,283
1872	63,317,014	1902	162,763,483
1873	63,267,187	1903	167,689,322
1874	55,300,781	1904	164,195,266
1875	62,261,719	1905	172,317,688
1876	67,753,125	1906	165,054,497
1877	62,679,916	1907	184,206,984
1878	73,385,451	1908	203,131,404
1879	74,383,495	1909	212,149,023
1880	74,795,273	1910	221,715,763
1881	79,020,872	1911	226,192,923
1882	86,472,091	1912	220,130,654
1883	89,175,023	1913	223,907,845
1884	81,507,801	1914	168,452,942
1885	91,609,959	1915	184,204,745
1886	93,297,290	1916	168,843,000
1887	96,123,586	1917	174,187,800
1888	108,827,606	1918	198,168,408
1889	120,213,611	1919	174,517,414

In order that an idea may readily be obtained of the centres from which production is now derived, the figures in Table 2, from the annual report of the U.S. Director of the Mint (1920), supplement those given in Table 1 for production itself.

Table 2.—Production of silver (10,000 oz.) by countries.

	1914	1915	1916	1917	1918	1919
United States	7,246	7,500	7,441	7,174	6,781	5,668
Canada	2,840	2,660	2,546	2,222	2,128	1,568
Mexico	2,754	3,950	2,284	3,500	6,252	6,268

	16,843	18,412	16,882	17,416	19,738	17,451

**United States.**—The production of silver in the United States, the bulk of which comes from the western states, has always constituted a high proportion of the world's supply. Generally speaking the major portion of U.S. silver is obtained from gold, copper, lead and zinc ores mined in the States and metallurgically treated in that country. In addition large quantities of similar ores are imported from other countries—Mexico, Central America, Peru, Bolivia, Chile and Canada—for treatment, and the silver thus resulting goes to swell the U.S. figures of production of refined silver. The United States first came into prominence as a large producer in 1859 when operations on the famous Comstock lode in Nevada began. In 1860 the production was 116,019 oz., and in 1915 the output reached the high figures of 74,961,075 ounces. The preliminary official estimate of the production in 1920 was 56,564,504 oz., a reduction of 117,941 oz., as compared with that of the preceding year.

On April 23 1918 the Pittman Act became law in America, under which it is provided that: "The Secretary of the Treasury is hereby authorized from time to time to melt or break up and sell as bullion not in excess of \$350,000,000, standard silver dollars now or hereafter held in the Treasury of the United States." This \$350,000,000 represented about 200 mill. fine oz., of which the share of India was reported to have been 200 mill. fine oz., all of which was received in India between July 1 1918 and July 17 1919. The Act also provided that these sales were to be replaced by purchases of silver actually mined in the United States at the rate of \$1. per oz. pure. The total purchases by the U.S. Treasury under this Act up to May 17 1921 totalled \$4,120,197 oz., thus leaving 145,879,803 oz., still to be repurchased.

**Mexico.**—This country can safely be described as first among silver-producing countries of the world, in spite of the decreased output of recent years following upon the outbreak of civil war in 1913. The silver-bearing ores are widely distributed throughout the country; the mines and mining districts are exceedingly numerous, and many of the mines have been in continuous operation for hundreds of years. In 1911 the mine production of silver was reported as 79,032,440 oz.; in 1914, owing to the civil war, it dropped to 27,546,752

oz., but subsequently the output steadily increased up to 1920. As to what the future Mexican production would be time alone could prove, but in 1921 good authorities did not hesitate to predict that, given a recognized and stable Government and a reasonable price, it would later exceed that of Mexico's palmist days.

**Canada.**—The Canadian production of silver hitherto has occupied the third position in the world's list of supplies. The metal is found chiefly in Ontario, British Columbia, Quebec and Yukon. The Ontario silver has been almost entirely derived from the silver ores of Cobalt, which field, however—judged from a continually reduced output—would appear to be working out. The British Columbia, Quebec and Yukon supplies are derived mainly from silver, lead and copper ores. In 1920 reports were coming to hand of discoveries of further silver-bearing ores which promise important results. In 1900 the total Canadian production was given as 4,468,225 fine oz., of which 3,958,175 came from British Columbia; in 1910 the Canadian output had increased to 32,869,264 fine oz., of which Ontario accounted for 30,366,366, whilst in 1919 the output was reduced to 15,675,134 fine oz., and the 1921 production seemed likely to show a further reduction.

**Central American States.**—The silver produced in these States—mainly Honduras, Costa Rica and Panama—is chiefly derived from gold-silver ores; the production in 1914 amounted to 2,754,868 fine oz., and in 1919, according to figures supplied by the director of the Washington mint, to 2,800,000 fine ounces.

**South American States.**—The countries included under this category rank as fourth producers of the metal. In early days the true silver mines in Peru, Chile and Bolivia ranked amongst the most important in the world, but as in the case of the older mines of Mexico they appear to be no longer in operation, and the production is being chiefly derived from base metal ores—copper and tin. In 1917 the production of Peru was reported as 10,865,061 oz., and in 1919 as 9,781,734 ounces. Bolivia in 1902, according to the U.S. mint reports, gave 12,992,641 fine oz., whilst in 1919 the production had dropped to 2,435,000 fine ounces. Chile was reported to have reached 2,349,379 fine oz. in 1900 and 1,900,000 fine oz. in 1919.

**Europe.**—Prior to the World War Germany was looked upon as the largest producer in Europe, and according to the *Metalgesellschaft* reports, the silver which is chiefly derived from base metal ores reached a production in 1904 of 5,822,727 fine ounces. The major portion of the concentrates from which the silver was extracted came from the Broken Hill mines in Australia.

**Spain.**—Next in Europe to Germany as a producer comes Spain, whose output of silver is mainly obtained from her important lead and copper ores. In 1915 her output was given as 4,565,396 fine oz., whilst in 1919, according to U.S. mint reports, it was stated to be 2,900,000 fine oz.—probably an approximate estimate.

**United Kingdom.**—It is impossible to say what the refinery output of silver in Great Britain is. It may, however, be stated that it is practically all obtained from imported ores treated in the country. The proportion of domestic mined ores is far too small for consideration. The number of refiners engaged in this business is considerable, but as they never publish returns, the difficulties experienced in arriving at anything approaching a reliable figure will be appreciated.

According to the "Census of Production" the total output in the United Kingdom in 1907 was given as about 43,979,000 oz. troy. **Australia.**—New South Wales stands prominent as the chief Australian producer, the silver being mainly obtained from the wealthy silver lead ores treated at the Broken Hill Works at Port Pirie. Their output for 1919 has been given as 6,304,818 fine ounces.

**Africa.**—The Transvaal, Cape Colony, and Natal provide the main output, and the 1919 production has been stated to be 891,304 fine oz., at the same time a not inconsiderable proportion of their gold-silver ores are shipped to and refined in England.

**Asia.**—The chief countries producing silver are Japan and India. The production of copper has made great strides in Japan of late years, and it is chiefly from these ores that her silver is obtained; the metal is also obtained from the gold ores mined in Formosa and Korea. Japan's output of silver in 1917 was reported at 6,844,500 fine ounces.

The Indian output is chiefly derived from the mines in Upper Burma belonging to the Burma Corp. Ltd., and the production from Jan. to Oct. 1920 amounted to as much as 2,014,261 oz., and it was said that 1,000,000 oz., per month would in the future be a very possible output. What India ultimately would be able to produce must remain problematical, but there is no question whatever about India's potential mineral wealth, which only requires time to develop.

**Consumption of Silver.**—Although great difficulties are experienced in obtaining definite data as to production, that problem is relatively simple in comparison with the consumption side of the subject. Briefly stated, consumption may be discussed from four standpoints—the respective world nations' coinages, their arts, and the requirements of India and China, and it is here that the absence of readily obtainable and reliable information is felt. In the case of America the admirable figures annually presented by the U.S. director of the mint, in so far as America is concerned, supply the following information:—

XXXII.—9

### American silver coinage.

1918	35,004,450 fine oz.
1919	14,682,079 " "
1920	19,763,600 " "

### Industrial arts.

Silver consumed	Of which new material
1917 27,039,845 fine oz.	15,998,807 fine oz.
1918 36,282,596 " "	20,722,333 " "
1919 34,700,521 " "	20,237,519 " "

As regards the coinage requirements of other nations, a most remarkable reversal of conditions has arisen. Prior to the World War the annual requirements for such purposes probably amounted to 70,000,000 oz. at least. In 1921 that was all changed, and the spectacle was presented of a great number of countries demonetizing silver as quickly as possible, and / or reducing the fineness of their silver coinages. England had reduced hers from 925 to 500, and the Straits Settlements from 900 to 500. The quantity of silver which had already been placed on the market, though somewhat problematical, was probably 50,000,000 oz., with a fairly safe estimate of as much more to follow.

As regards the world's requirements for arts, it may be safe to say that the majority of European countries were in 1921 in far too impecunious a position owing to the war to become real factors under this heading for many years to come—in fact, the majority had been and still were sellers of silver ware.

Table 3.—Silver coin and bullion imported into and exported from British India, 1887–1919. (British standard ounces.)

Fiscal yr. ended March 31.	Imported	Exported	Net Imports
1887–8	37,877,141	5,994,542	32,782,599
1888–9	37,844,665	5,408,636	32,436,029
1889–90	43,940,659	5,296,885	38,643,774
1890–1	56,190,870	4,661,785	51,529,085
1891–2	38,177,580	5,829,142	32,348,438
1892–3	54,180,144	8,656,632	45,523,512
1893–4	60,328,296	5,999,333	54,328,973
1894–5	32,638,069	5,598,047	27,040,022
1895–6	34,082,816	7,064,731	27,018,079
1896–7	37,520,322	11,591,234	25,929,088
1897–8	68,335,612	24,250,995	44,084,617
1898–9	49,226,780	20,061,355	29,165,425
1899–1900	50,663,542	32,017,260	18,646,282
1900–1	64,746,549	15,311,385	49,435,164
1901–2	66,726,972	27,721,780	39,005,192
1902–3	75,759,185	32,294,876	43,474,309
1903–4	104,324,765	25,142,629	79,182,136
1904–5	98,118,908	23,790,313	74,349,595
1905–6	88,854,079	4,535,314	84,317,765
1906–7	128,878,008	7,079,151	118,198,857
1907–8	106,358,274	8,442,195	97,915,359
1908–9	85,048,761	11,308,630	73,740,131
1909–10	75,501,745	14,486,993	61,014,752
1910–1	69,272,319	14,396,030	54,876,289
1911–2	70,378,747	38,149,647	32,229,100
1912–3	107,190,427	16,112,785	91,077,642
1913–4	79,834,999	8,727,648	71,107,351
1914–5	64,160,128	8,394,005	55,766,123
1915–6	39,833,279	6,900,906	32,932,373
1916–7	116,959,115	24,776,309	92,193,806
1917–8	88,814,458	14,282,906	74,531,498
1918–9	241,747,806	4,719,187	

In studying the figures for British India (Table 3) very great care is necessary to discriminate between what represents Government and what private imports, as the Government figures are for coinage purposes entirely. The need for this will be apparent when it is realized that out of the figures given in Table 3 for the years 1912 to 1919 Government coinage requirements were:—

	Standard oz.
1912–3	56,057,978
1913–4	35,425,057
1914–5	169,342
1915–6	302,259
1916–7	109,522,499
1917–8	79,404,555
1918–9	237,189,080

As the stock of silver held by the Government of India in their currency reserve, according to the return dated May 22 1921,

amounted to Rs. 66,41,00,000—against an average for the five pre-war years, 1910-4, of Rs. 21,09,00,000—it may safely be assumed that they were not likely to be purchasers of the metal for some years to come.

As regards China's consumption, it is an almost hopeless task to supply anything approaching reliable data. The figures in Table 4, however, taken from the Chinese Maritime Customs reports may be taken as approximately correct—they are, however, given in Haikwan taels.

Table 4.—China.

	Imports	Exports
1914 . . . . .	861,167 taels	13,861,917 taels
1915 . . . . .	818,827 "	18,211,040 "
1916 . . . . .	19,003,117 "	8,102,268 "
1917 . . . . .	13,871,778 "	5,024,575 "
1918 . . . . .	1,228,342 "	2,281,659 "
1919 . . . . .	51,078,643 "	9,896,429 "
1920 . . . . .	50,966,880 "	68,460,360 "

Imports into Hong Kong for the year 1920 were reported to be the equivalent of £7,040,700—the greater portion of which was probably dealt with by the mint in Canton. The stocks of silver held in Shanghai on Dec. 31 of the following years are shown in Table 5. The increase in stocks in 1920 over 1919—viz, taels 15,460,000, and dollars 18,420,000—represents the equivalent of an increase of about 31,030,820 ounces.

Table 5.—Stock at Shanghai.

	Taels	Dollars	Bar Silver
1917 . . . . .	21,760,000	14,640,000	357
1918 . . . . .	18,860,000	13,470,000	4
1919 . . . . .	19,140,000	11,260,000	242
1920 . . . . .	34,600,000	29,680,000	nil

*Prices.*—Table 6 gives the highest, lowest and average price of bar silver in London per oz., British standard—925 fine—since 1833, from which it will be seen that the highest quotation recorded since 1833 was 80½d. in 1920, the next highest being 79½d. in 1919, 62½d. in 1859 and 62½d. in 1864. Though the highest point reached was in 1920, the average quotation for that year was only 61½d. against averages in 1859 of 62½d. and 61½d. in 1864, which would point to more stable conditions existing in the silver market in the years 1859 and 1864 than in 1920. To the years 1902 and 1903 belong the honour of recording the lowest prices, viz. 21½d., whilst the lowest average goes to 1915 with 23½d. followed by 1909 with 23½d. When the Pittman Act became law in the United States, good authorities, not only in America but in England, made bold to assert that the result of this Act would be to stabilize the world's price of silver at not less than \$1 per oz., for many years to come, whilst Senator Pittman went further and predicted that the world's price would range between \$1—and \$1.29—the parity of the American silver dollar—for the next 20 years. The spot price in London on June 1 1921, was 33½d., and the price in America on the same date for foreign mined silver was 60 cents nominal.

Table 6.—Highest, lowest, and average price of bar silver in London, per oz. (British standard 0.925) from 1833 to 1920.

(W. E. P.)

**SIMON, SIR JOHN ALLSEBROOK** (1873— ), British politician and lawyer, the son of a Congregational minister, was educated at Fettes, and at Wadham College, Oxford, where he was a scholar and was eventually elected an hon. fellow. He became pres. of the Union in 1896, and took a first-class in *Lit. Hum.* in the same year, being subsequently elected fellow of All Souls. He went to the bar, became Barstow Law scholar in 1898, and was called in 1899. His manifest abilities and the persuasiveness of his advocacy soon brought him into notice; he was chosen one of the counsel for the British Government in the

arbitration on the Alaska Boundary in 1903; and he rapidly attained so considerable a practice that he was able to take silk in 1908. Meanwhile he had gone into politics, and was elected as an advanced Liberal for Walthamstow at the general election of 1906. At first, probably owing to his absorption in his legal work, he did not command nearly so much attention in Parliament as his Wadham contemporary and fellow-lawyer, Mr. F. E. Smith (afterwards Lord Birkenhead). But he gradually made his way, and was appointed by Mr. Asquith solicitor-general in 1910, and Attorney-General with a seat in the Cabinet in 1913. On the outbreak of war in 1914, his resignation, along with those of Lord Morley and Mr. Burns, was confidently expected; but he finally decided to remain with his chief and the bulk of his colleagues. When the first war Coalition Government was formed in May 1915, he was offered the lord chancellorship, but he declined the greatest prize of his profession as he preferred a political career in the Commons. Accordingly he accepted the home secretaryship, and gave up his legal practice, by means of which he had acquired a comfortable fortune. Early, however, in the following year, owing to his inability to accept the Government bill for compulsory military service, he resigned his office and led a fruitless opposition to the measure in the House; and then went out to the front in France as a major in the R.A.F. He subsequently resumed practice as a barrister, and immediately regained his position in the front rank of his profession. On the break between Mr. Asquith and Mr. Lloyd George, Sir John Simon adhered to the former. He lost his seat in Parliament at the general election in Dec. 1918, subsequently taking an active part in political work outside the House in the interests of the Independent Liberals. He was twice married—in 1899 to Ethel M. Venables, who died in 1902, leaving a son and two daughters, and in 1917 to Kathleen Manning.

**SIMS, WILLIAM SOWDEN** (1858— ), American naval officer, was born at Port Hope, Ont., Canada, Oct. 15 1858. In childhood he removed to Pennsylvania and was graduated from the U.S. Naval Academy in 1880. Then for eight years he served on board various ships in the N. Atlantic. During 1889-93 he was with the nautical school ship "Saratoga," and then was transferred to the Pacific Station, and later to the China Station. From 1897 to 1900 he was naval attaché to the American embassy, first at Paris and afterwards at St. Petersburg. In 1900 he returned to the Pacific Station. Convinced of the inadequacy of American methods of target practice Lieutenant Sims wrote numerous letters to the Washington officials urging changes. Meeting with no response he finally addressed a personal letter to President Roosevelt, which led to his recall to Washington. In the end he was enabled to arrange for a gunnery test and proved his claims. In 1902 he was assigned to the Bureau of Navigation, serving for the next seven years as inspector of target practice, which was remarkably improved under his guidance. Meanwhile in 1907 he was made commander and appointed naval aide to President Roosevelt. With this rank he was placed in charge of the battleship "Minnesota" in 1909. The following year, during a visit of the Atlantic Fleet to England, Commander Sims caused a stir by certain indiscreet remarks made at a dinner at the Guildhall, London, where he said: "Speaking for myself, I believe that if the time ever comes when the British Empire is menaced by an external enemy, you may count upon every man, every drop of blood, every ship, and every dollar of your kindred across the sea." A semi-official protest against this utterance was made at Washington by the German Government, which took offence at it, and there was some talk of Sims being dismissed from the service, but the incident ended in a severe reprimand from the Secretary of the Navy. In 1911 he was promoted captain and for two years was a member of the staff of the Naval War College, Newport, R.I. During 1913-5 he was in command of the Atlantic Torpedo Flotilla and then returned to Newport as president of the Naval War College. When America entered the World War in April 1917 he was chosen to command American naval operations in Europe. In Jan. he had been promoted

rear-admiral, and early in April, when war was imminent but before its formal declaration, he sailed in disguise to England in a merchant vessel. In May he was made vice-admiral. In 1916 he had urged construction of battle cruisers, arguing their supremacy over submarines as shown in the battle of Jutland. In his book *The Victory at Sea* (1920, in conjunction with Burton J. Hendrick) he shows how the convoy system, used in transporting 2,000,000 American troops, frustrated the submarines. In 1919 he criticised the manner in which naval honours had been awarded; in particular, he held that "the commanding officer of a vessel that is sunk by a submarine should not receive the same reward as the commanding officer of a vessel which sinks a submarine." This criticism was obviously directed against the Secretary of the Navy for having decorated his own son-in-law, whose boat was sunk. He himself refused the D.S.M. In 1920 he made a formal report to the U.S. Senate, and charged the U.S. Naval Board with serious errors in the conduct of naval operations during the war. His English sympathies and his admiration for the British navy were openly expressed—too openly for the liking of some of his critics.

**SINCLAIR, MAY** ( — ), English author, was born at Rock Ferry, Cheshire, and educated at the Ladies' College, Cheltenham. She began her career by writing verse and philosophical criticism. In 1895 she published her first short story, followed in 1896 by her first novel *Audrey Craven*. Mr. and Mrs. Neville Tyson appeared in 1898 and *Two Sides of a Question* in 1900. But it was not until she published *The Divine Fire* in 1904 that she became widely known. It was followed by *The Helpmate* (1907); *Kitty Tailleur* (1908); *The Creators* (1910); *The Combined Maze* (1913); *The Three Sisters* (1914); *Tasker Jevons* (1916); *The Tree of Heaven* (1917); *Mary Olivier* (1919) and *The Romantic* (1920), as well as one or two volumes of short stories. In *A Defence of Idealism* (1917) Miss Sinclair published acute criticisms of modern philosophic theories, and in a *Journal of Impressions in Belgium* (1915) she gave her experiences in the autumn of 1914 as a member of an advance field ambulance.

**SINHA, SATYENDRA PRASSANO, 1ST BARON** (1864— ), Indian statesman, was born of an ancient Kayastha family in the village of Raipur, Birbhum district, Bengal, in June 1864. Matriculating at 14 he held a scholarship at the Presidency College, Calcutta, and in 1881 came to London to join Lincoln's Inn, where he won many prizes and scholarships, and was called to the bar in June 1886. In practice at Calcutta he rapidly rose to a leading position and was appointed standing counsel to the Government of India in 1903. He was the first Indian to be appointed advocate-general of Bengal (1908), and the first to become a member of the Government of India. He held the law portfolio from April 1909 to Nov. 1910, up to the retirement from the vicereignty of Lord Minto, who testified to the success of what some English critics regarded as a dangerous experiment. Sinha resumed his lucrative practice at the bar, presided at the Indian National Congress session at Bombay in 1915, and was again appointed advocate-general of Bengal (1916). He and the Maharaja of Bikaner were the first Indians to participate in Empire deliberations in London, for in 1917 they jointly assisted the Secretary of State at the meetings of the Imperial War Cabinet, and were members of the Imperial War Conference. Sinha joined the Bengal Executive Council in the same year, but returned to England in 1918 as a member of the Imperial War Cabinet and Imperial War Conference. Immediately on getting back to India he was called to London and Paris as an Indian member of the Peace Conference. Knighted in 1915, in 1918 he was made K.C., a distinction not previously conferred upon a barrister of Indian birth or practice. When the Coalition Government was recast at the beginning of 1919 he established further records for an Indian by being appointed to the Ministry as Under-Secretary for India, and being raised to the peerage as Baron Sinha of Raipur. He was the second Indian to be sworn of the Privy Council. He skilfully conducted the Government of India Act, 1919, through the House of Lords, and when dyarchy was initiated at the close of 1920 was appointed governor of Bihar and Orissa, being the first Indian to preside over a British province.

**SINN FEIN:** see IRELAND: *Political History*.

**SKEAT, WALTER WILLIAM** (1835-1912), English author (see 25.168), died at Cambridge Oct. 6 1912.

**SLATIN, SIR RUDOLF CARL VON** (1857- ), Anglo-Austrian soldier and administrator in the Sudan (see 25.212). For his capable and gallant services in the Sudan Slatin Pasha had been created K.C.M.G. and had received the thanks of both Houses of Parliament in 1899. In 1906 he was created a baron of the Austrian Empire and was made an Austrian privy councillor in 1904. The same year he married Baroness Alice von Ramberg of Vienna (d. 1921). In 1912 he received the G.C.V.O. from H.M. King George. On the outbreak of the World War, Slatin, who was on leave in Vienna, was prevented, by the Austrian mobilization, from returning to his appointment in the Sudan, and in this difficult position he voluntarily took up work as head of the Austrian Red Cross, and in charge of prisoners-of-war, and would accept no remuneration for his services. In this capacity he did much to ameliorate the conditions of imprisonment, and was largely responsible for the humane treatment of the Allied soldiers in Austrian hands. The German Government (through Bethmann Hollweg) offered him a high post which he refused. Subsequent to the signing of the Armistice, he was selected as a member of the Austrian delegation to discuss the terms of peace in Paris.

**SMILLIE, ROBERT** (1839- ), British labour politician, was born in Belfast in 1839 of Scottish parents. He was sent to a primary school but left at the age of 14 years to work in a shipyard at Govan. Two years later he went into the mining industry of Lanarkshire and worked underground for 16 years. From 1878 onwards he was an active trade unionist, although in the earlier years of this period he was earning only 18s. 6d. a week. In 1890 he was elected paid organizer for the Larkhall district and owing to his activity the Lanarkshire Miners' Union soon reached a membership of 30,000. He took a prominent part in the formation of the Scottish Coal Trade Conciliation Board and its satisfactory results were largely attributable to his efforts. His abilities as a leader caused him to rise steadily from the chairmanship of the Scottish Trade Union Congress to the first presidency of the parliamentary committee of the Scottish Trade Union Congress and in 1894 he became permanent president of the Scottish Miners' Federation. In 1912 he was elected to the presidency of the Miners' Federation of Great Britain and the building up of this body has been the great work of his life. Politically his success has not been so great as on the industrial field and although he stood as a candidate for Parliament seven times he was never elected. His greatest poll was 3,847 in a three-cornered fight at Mid-Lanark in 1910. In 1885 he was elected a member of the district school board for Larkhall, a position which he filled for 20 years. His work on the Coal Industry Commission from March till June 1919 brought him into greater prominence, but he became very ill in Nov. 1919. In March 1920, as his health was no better, he tendered his resignation from the presidency of the Miners' Federation, but the Federation refused to accept it and gave him leave of absence instead. In March 1921 ill-health compelled him to resign from the Federation and retire from public life.

**SMITH, ALFRED EMANUEL** (1873- ), American politician, was born in New York City, Dec. 30 1873. The son of humble parents, his father being a truck driver, he was educated in the St. James parochial school and for several years was employed in the Fulton Fish Market. He was very popular with his associates and at the age of 29 was offered the Democratic nomination for the N.Y. State Assembly by the Tammany leader of the district in which he lived. He was elected for 1903 and by reelection served for 12 years. In 1911 he became Democratic leader in the Assembly and was appointed vice-chairman of the Factory Investigating Committee which made a searching inquiry into industrial conditions in the state, resulting in remedial legislation. In 1913 he was speaker of the Assembly. In 1915 he was chosen a delegate to the State Constitutional Convention, taking an active part in its proceedings. He opposed the constitution as finally revised, one reason being that it contained a provision designed to pre-

vent New York City from having a majority of legislators. He "stumped" the state against its adoption and it was overwhelmingly rejected. The same year he was elected sheriff of New York county, then a lucrative post because of the system of fees (later abolished), and in 1917 president of the Board of Aldermen of New York City. In 1918 he was elected governor of New York, defeating Charles S. Whitman. As a member of the Assembly he had been a strong supporter of woman suffrage, and in June 1919, as governor, called a special session which ratified the woman suffrage amendment to the Federal Constitution. In 1920 he was again the Democratic nominee for governor, but was beaten in the overwhelming Republican landslide of that year; he lost, however, by only 73,000 votes, whereas the Democratic candidate for president was at the same time defeated by a million votes in New York state—a remarkable testimony to his own personal popularity.

**SMITH, ALFRED HOLLAND** (1863- ), American railway official, was born in Cleveland, O., April 26 1863. He began work on the New York Central railway system as a messenger-boy in 1879. After serving as a foreman of construction and in various capacities in the engineering department, he was in 1890 appointed superintendent of the Kalamazoo division of the Lake Shore & Michigan Southern railway. He was successively division superintendent, assistant general superintendent and general superintendent of the Lake Shore road. In 1902 he became general superintendent of the New York Central railroad; in 1906 vice-president of the New York Central system; and in 1914 president. When the American railways were taken over by the U.S. Government Dec. 27 1917, he was appointed assistant director-general and it was he who worked out the form of central and regional administration under which the railways of the country were managed during the 26 months of Government operation. His aim, in which he succeeded, was to keep the management of the roads with their 2,000,000 employees, nearly all voters, in the hands of practical railway-men and, above all, out of politics. He divided the country into two regions and later into seven, each region being in charge of a railway officer of experience and reputation, he himself taking charge of the most important region, the Eastern. These regional directors had complete authority and only broad matters of policy and inter-regional questions were handled by the central (political) administration at Washington. In this way the railways were conducted throughout the war without great blunders or disorganization. On the completion of this important national service he was reelected president of the New York Central Lines in June 1919. It was largely due to him that the New York Central Lines were greatly strengthened in operating efficiency and financial credit.

**SMITH, FRANCIS HOPKINSON** (1838-1915), American author, artist and engineer (see 25.260), died in New York City April 7 1915. His later writings included *Kennedy Square* (1911); *The Arm-Chair at the Inn* (1912); *Charcoals of New and Old New York* (1912); *In Thackeray's London* (1913) and *In Dickens' London* (1914).

**SMITH, SIR GEORGE ADAM** (1856- ), British divine (see 25.261), was knighted in 1916, and from 1916 to 1917 was moderator of the general assembly of the United Free Church of Scotland. His later works include *The Early Poetry of Israel* (1912); *Atlas of the Historical Geography of the Holy Land* (with J. G. Bartholomew, 1914) and *Syria and the Holy Land* (1918).

**SMITH, THEOBALD** (1859- ), American pathologist, was born at Albany, N.Y., July 31 1859. He was educated at Cornell (Ph.B. 1881) and at the Albany Medical College (M.D. 1883). In 1884 he was appointed director of the pathological laboratory of the Bureau of Animal Industry, in Washington, where for 11 years he investigated infectious animal diseases. At the same time he was professor of bacteriology at Columbian, later known as George Washington, University. From 1895 to 1915 he was director of the pathological laboratory of the Massachusetts State Board of Health, and after 1896 was professor of comparative pathology at Harvard. In 1915 he was appointed director of the department of animal pathology of the Rockefeller Institute for Medical Research, New York. He

made important contributions to the relation between human and bovine tuberculosis.

His numerous scientific papers include *Investigations into the Nature, Causation, and Prevention of Texas or Southern Cattle Fever* (1893); *Investigations Concerning Bovine Tuberculosis with Special Reference to Diagnosis and Prevention* (1894); *Investigations of Diseases of Domesticated Animals* (1897); *The Agglutinative Affinities of Related Bacteria Parasitic in Different Hosts* (1903) and *Certain Aspects of Natural and Acquired Resistance to Tuberculosis and Their Bearing on Preventive Measures* (1916).

**SMITH COLLEGE** (see 25.273).—Between 1910 and 1921 Smith College added to its equipment Burton Hall for biology, and the number of dwelling houses for students increased from 16 to 33. The library in 1920 contained 82,000 volumes and the Hillyer Art Gallery had increased its endowment to \$100,000 and added largely to its collections. The college abandoned the system of admission by certificate and all students enter by examination. In 1919–20 there were 181 teachers and 2,001 students, of whom 31 were graduate students, and the endowment was \$3,157,000, the total assets being over \$6,000,000. A campaign for increased endowment was carried on in 1920, with the result that, when the promises were realized, the assets of the college would be over \$9,000,000. The college publishes, besides its permanent bulletin, the *Smith College Studies* in history, modern languages and classics, and contributions of the department of biology. President Seelye was succeeded in 1910 by Marion LeRoy Burton (b. 1874), a graduate of Carleton College, Northfield, Minn., and Yale Divinity School, who resigned in 1917 and was succeeded by William Allan Neilson (b. 1869), a graduate of Edinburgh and Harvard Universities. In the World War the Smith College Relief Unit, the pioneer among American college women's units overseas, worked in 16 villages in the Somme, France, affiliated with the American Fund for French Wounded, and later with the Red Cross, from July 1917 until April 1920, with the exception of the period after the retreat of March 1918 until the following Jan., when the unit operated clubs and canteens and assisted in the hospitals at Beauvais and later behind the American front at Château-Thierry, at Nancy, and in the Argonne. A small group of the Relief Unit worked with the refugees at Orléans in the autumn of 1918. Three Smith Canteen Units were organized and operated under the Y.M.C.A. in France. Another small group worked as a Smith Unit with the Near East Relief in Armenia.

(W. A. N.)

**SMITH-DORRIEN, SIR HORACE LOCKWOOD** (1858– ), British general, was born May 26 1858. He joined the army in 1876, took part in the Zulu war and in the Egyptian campaign of 1882 and, attached to the Egyptian army, served at Suakin in 1884 and afterwards on the Nile in 1885–6, for which he was given the D.S.O. He took part in the Tirah campaign of 1897–8 and, showing conspicuous skill in handling troops, was rewarded with a brevet lieutenant-colonelcy. Immediately afterwards he was summoned to the Sudan to take part in the final advance to Khartum; for this he was promoted brevet colonel. He went out to the Cape in command of his regiment in 1899 and was shortly afterwards given a brigade and promoted major-general; he remained in the field in S. Africa, taking part in numerous operations, until the end of 1901, when he was appointed adjutant-general in India. From 1903 to 1907 he acted, first as a district, and afterwards as a divisional commander, being promoted lieutenant-general in 1906. He was then brought home to take up the command at Aldershot, an appointment which he filled with marked success until 1912, when he was transferred to the Southern Command; he was promoted general that year.

On the death of Gen. Grierson in Aug. 1914 while the Expeditionary Force was still assembling in France, Sir H. Smith-Dorrien (who had been given the G.C.B. in 1913) was appointed commander of the II. Army Corps. At Mons, and during the subsequent retreat, the brunt of the enemy's onsets fell upon his troops, and when hard pressed near Le Cateau he found himself obliged to halt and to give battle; by his resolute action he effectually checked pursuit, while his losses were somewhat heavy. He subsequently commanded his corps at the battle of the Marne,

on the Aisne, and during the severe fighting in Flanders in Oct. and Nov. On the splitting up of the Expeditionary Force into two armies he was appointed to the command of the II., receiving the G.C.M.G. for his services. This position he occupied until April 1915, when he returned to England and was placed in charge of one of the Home Defence armies. In the following Nov. he was chosen to take charge of the operations against German East Africa, but he fell ill on the voyage out, was unable to take up the command, and had to return home. He was appointed lieutenant of the Tower in 1917 and in 1918 became governor and commander-in-chief at Gibraltar.

**SMOOT, REED** (1862– ), American politician, was born at Salt Lake City, Utah, Jan. 10 1862. He was educated in his native town and at the Brigham Young Academy, Provo, Utah. He amassed considerable wealth as a banker and woolen manufacturer. In 1895 he was appointed one of the presidency of the Utah Stake of the Church of Jesus Christ of Latter Day Saints (Mormon), and in 1900 was made an apostle. He was elected to the U.S. Senate from Utah in 1902 and reelected in 1908, 1914, and 1920. In 1903 attempts were made to prevent his entering the Senate because of his connexion with the Mormon church, and on the charge that he personally favoured polygamy and even that he himself was a polygamist. He was allowed to take his seat; but the matter was placed in the hands of the Senate Committee on Privileges and Elections for further investigation. In June 1906 the Committee by a vote of 7 to 5 recommended that he be unseated; but as the personal charges against him had not been proved the Senate in Feb. 1907 by a vote of 42 to 23 refused to remove him. In 1919 he was chairman of the Republican Senatorial Campaign Committee. In 1921 he was a leading advocate of the adoption of a sales-tax, but failed to obtain its acceptance by the Senate, though the movement was widely favoured in business circles.

**SMUTS, JAN CHRISTIAN** (1870– ), S. African statesman, of Dutch descent, was born at Cape Town in 1870, the son of J. A. Smuts, member of the Legislative Assembly for Malmesbury, Cape Colony. He was educated at the Victoria College, Stellenbosch, at the Cape University, and then went to Christ's College, Cambridge, where he took a "double first" in the Law Tripos in 1894. In 1895 he returned to Cape Town and practised as an advocate of the Supreme Court of the Cape till the end of 1896, when he went to Johannesburg to practise as an advocate there. The rapidity of his success is shown by his appointment as State Attorney to the Transvaal Republic in 1898. Thus before he was 30 his remarkable ability was acknowledged and, though he was opposed to the policy of President Kruger, his hand is to be recognized in the State documents of the Transvaal during the critical period which ended in the sending of the ultimatum to Great Britain and the outbreak of the S. African War of 1899–1902. During that war Smuts served throughout with Boer forces, rising during its latter period to the rank of general, and to the authority among his own people of one who had shown the possession of gifts as a leader in the field as brilliant as those which he was known to possess in the realm of the law. Thus when the negotiations for peace began Smuts stood out as one of the recognized Boer leaders.

With Gen. Botha, he threw his influence during the negotiations into the scale for peace, and when, in 1907, responsible government was granted to the Transvaal, Smuts became the right-hand of Gen. Botha, the first Prime Minister of the Transvaal, in the Ministry which he then formed. As colonial secretary the bulk of the administrative work of the new Ministry fell to him, and his success as an administrator was then proved beyond subsequent doubt. He brought to his task an intellect of the first calibre—keen, quick, penetrating. His industry was untiring. Already a man of the world, he commanded the admiring devotion of his subordinates. These gifts would have secured for Smuts a position of great influence in any Ministry. They were no more than one of Smuts' many claims to such a position in the Botha Cabinet. He showed at once that he had high parliamentary ability. His rapid brain made him a master in debate. The complexities of legislation had no diffi-

culties for him. His mind had a natural bent towards compromise on unimportant points, and he showed again and again an almost uncanny gift for producing at a moment's notice the form of words that would give body to such compromises. His loyalty to, and affection for, Gen. Botha strengthened an influence thus already very strong, and when in 1909 the S. African National Convention met to draft an instrument for the union of the four S. African colonies, Smuts went to it as a delegate from the Transvaal with a reputation for ability and capacity second to that of no other delegate. High as it was, this reputation was enhanced by his work at the Convention. He had gathered round him a staff of experts, had thought out a scheme of union, had worked out its details, was prepared to put this framework before the first meeting. Such foresight had its reward, the more because it was buttressed during the debates of the Convention by the same readiness in debate, the same clear recognition of essentials, the same natural disposition towards compromise on details, and the same quickness in producing verbal formulae, as Smuts had already shown in the Transvaal Parliament.

When union was accomplished Smuts became for S. Africa what he had been for the Transvaal—the right-hand of Gen. Botha, the first Prime Minister of the Union. His success, both administrative and parliamentary, in the Transvaal was repeated as a minister of the Union. As Minister of the Interior, of Mines, and of Defence, he bore the lion's share of the early administrative work of the Union. His Defence Act, passed in 1912, was a model of organization, and the speech in which he moved its second reading in the Union House of Assembly established his reputation throughout S. Africa.

Thus on the outbreak of the World War in 1914, when Gen. Botha declared for the most loyal support of the British Government, the bulk of the burden of organizing the military forces of the Union fell upon Smuts. It was sustained with complete success. The expedition against German S.W. Africa, and the crushing of the rebellion in the Union in 1914, both bore testimony to his capacity as an organizer of victory. He took command of the Union columns invading German S.W. Africa from the S. and carried through that part of the campaign with great boldness of strategy and complete success. Then Botha and Smuts turned to other fields of war. Expeditionary forces were organized against German E. Africa and to take part with the Allies in the fighting on the western front in Europe. In Feb. 1916 Smuts was appointed by the British Government commander-in-chief of the Imperial forces operating in German E. Africa. He had been offered the appointment in Nov. 1915, but had then declined. When he took command, the operations against German E. Africa had reached a state of stalemate. He conducted his campaign with great vigour, exacting from his troops heavy sacrifices of long marching in that trying climate, and before the end of 1916 he had reduced the German forces to the position of fugitive bands. Then another duty called him away from E. Africa. At the end of 1916 Mr. Lloyd George became Prime Minister of Great Britain and at once summoned the Imperial War Cabinet. General Smuts went to it as the representative of S. Africa. So useful did he prove himself to be in that position that he became the only permanent Dominion member of the Imperial War Cabinet. With Botha he represented S. Africa at the Peace Conference in Paris, and returned to S. Africa after peace was signed, only to lose Botha almost immediately and to find himself, by the sudden death of his leader and close friend, Prime Minister of the Union in Sept. 1919.

The political position in S. Africa was menacing. The Nationalist agitation, led by Gen. Hertzog, had grown among the Dutch-speaking people during the war. Resentment at being involved in the quarrels of Europe had fed it. The old passion of the Dutch of S. Africa for peaceful isolation had revived in full strength. Smuts speedily made up his mind that the sense of the country must be tested by a general election. It took place in the spring of 1920 and left Smuts and his party without the semblance of a clear majority in Parliament. Smuts

held office by the grace of the Unionists. He had no doubt as to the needs of his position. S. Africa required an established Government; it must be formed by combination between his followers and one of the other parties. His natural impulse was for reconciliation with the Nationalists, and he sought reconciliation with them, but on one clear condition. They must repudiate their Republican aims; and S. Africa must remain willingly a state of the British group of nations. This condition the Nationalists refused. Then Smuts turned to the Unionists, who throughout the war had supported the Botha Ministry as the one safeguard of membership for the S. African state of the British Commonwealth of Nations. With ready self-sacrifice the Unionists accepted his invitation. The two parties were joined into one, the Unionists becoming members of the S. African party, which had been Botha's party and was now led by Smuts. The general election of March 1921 followed, and gave the new party a decisive victory at the polls and a clear and substantial majority in the Parliament of the Union. (B. K. L.)

**SMYTH, ETHEL** (1858— ), English musical composer, was born in London on April 23 1858, the daughter of Gen. J. H. Smyth. She began her musical studies at Leipzig in 1877, becoming a pupil of Heinrich von Herzogenberg, then conductor of the Bach Verein, whose wife was an intimate friend of Johannes Brahms. She was thus thrown from the first into a highly intellectual musical society. Her earliest works, principally chamber music, were performed at Leipzig; her first orchestral works being produced by (Sir) August Manns at the Crystal Palace concerts and the symphony concerts started in 1886 by (Sir) George Henschel. She also produced a Mass, performed in 1893 at the Albert Hall. Subsequently she turned her attention to opera, her first work in this direction being *Fantasio*, based upon a book by De Musset (produced at Weimar 1898 and revived at Karlsruhe 1901). This was followed by *Der Wald*, produced at Dresden in 1901 and at Covent Garden, London, in 1902, and New York 1903; and *The Wreckers*, produced under the title "Strandrecht" at Leipzig and Prague in 1906, at His Majesty's theatre, London, in 1909, and at Covent Garden in 1910. Her opera, *The Boatswain's Mate*, written for a German theatre, but, owing to the war, not produced there, was produced in London in 1915, and was revived in 1918 and met with considerable success. She also published in 1907 a series of songs with instrumental accompaniment, and in 1913 four orchestral songs. Miss Smyth, who received the degree of Mus. Doc. from Durham University in 1910, became known as a leading militant suffragette, and, besides other music written for the cause, produced *The March of the Women* (1911). In 1919 she published two volumes of brightly written autobiography and reminiscences under the title *Impressions that Remained*, and in 1921 another book, *Streaks of Life*. On Jan. 1 1922 she was created D.B.E.

**SMYTH, HERBERT WEIR** (1857— ), American classical scholar, was born at Wilmington, Del., Aug. 8 1857. He was educated at Swarthmore (A.B. 1876), Harvard (A.B. 1878), Leipzig, and Göttingen (Ph.D. 1884). During 1883-5 he was instructor in Greek and Sanskrit at Williams College, and then for two years was reader in Greek at Johns Hopkins. From 1887 to 1901 he was professor of Greek at Bryn Mawr. In the latter year he was called to Harvard as professor of Greek and in 1902 was appointed Eliot professor of Greek literature, succeeding William Watson Goodwin. During 1899-1900 he was professor of the Greek language and literature at the American Classical School at Athens. From 1889 to 1904 he was secretary of the American Philological Association and editor of its *Transactions* and in 1904 was elected president. He became a fellow of the American Academy of Arts and Sciences, a member of the American Philosophical Society and vice-president of the Egypt Exploration Society.

His works include *The Sacred Literature of the Jains* (1894, a translation); *The Ionic Dialect* (1894); *Greek Melic Poets* (1900); *Greek Grammar for Schools and Colleges* (1915); *Greek Grammar for Colleges* (1920). He was also author of *The Greek Language in its Relation to the Psychology of the Ancient Greeks* (read before the Con-

gress of Arts and Sciences at the St. Louis Exposition in 1904); "Aspects of Greek Conservatism" (in *Harvard Studies in Classical Philology*, 1906); "Greek Conceptions of Immortality from Homer to Plato" (in *Harvard Essays on Classical Subjects*, 1912) and various contributions to philological journals. He was editor of the *Greek Series for Colleges and Schools* (20 vols.).

**SNOWDEN, PHILLIP** (1864– ), British Labour politician, was born at Cowling, Yorks, July 18 1864. He was educated partly privately and partly at a board school, and in 1886 entered the Civil Service. In 1893 he retired, and devoted himself to journalism and lecturing, becoming well known for his ardent advocacy of extreme socialistic views. He unsuccessfully contested Blackburn in 1900 and Wakefield in 1902, and in 1903 he became chairman of the Independent Labour party. He held this position until 1906, and in that year was returned as Socialist member for Blackburn. He sat on various royal commissions, including those on the Civil Service and Venereal Diseases, and from 1917 to 1919 was again chairman of the Independent Labour party. Mr. Snowden made himself extremely unpopular during the World War owing to his pacifist opinions, and was one of the Socialist members of Parliament who lost their seats at the general election of 1918. He had married in 1905 Miss Ethel Annikin, who became well known as a speaker and writer on social subjects. In 1920 she went to Russia as a member of one of the various Labour delegations invited to inspect Soviet conditions of government. She published on her return an account of her experiences, under the title of *Through Bolsheviki Russia* (1920).

**SOCIALISM** (see 25,301\*).—Socialism is at once a theory, or rather a whole body of theories, and a movement, or rather a number of movements more or less closely connected. The name has been used during the past century to describe many different social theories, in all of which a common character has been perceived. In recent times it has come to be used less with reference to any definite theory than for the purpose of describing the movements in various countries which have adopted the name or have declared their adhesion to Socialism. It is thus possible, in setting out to give a summary account of Socialism, to describe it either by its connotation, that is to say, in terms of the ideas for which it stands, or by its denotation, that is, in terms of the groups and parties which profess allegiance to it. But neither of these methods of description is by itself satisfactory, nor is it possible by either, or even by a combination of both, to arrive at a satisfactory or adequate definition of Socialism. The word is used, and has been used increasingly in recent years, in a number of different and frequently overlapping senses. It has changed its meaning with time: but the changes have not served to clarify it, but rather to increase the number of different senses in which the term is used.

It would be well to begin by ruling altogether out from the scope of this article certain popular uses of the term which have been current especially during the past generation. The well-known phrase, "We are all Socialists now," and the constant references to "socialistic legislation," only serve to obscure the real meanings which attach to the word. When it is said that, "We are all Socialists now," all that is meant is that everybody nowadays is prepared to agree that a greater measure of governmental intervention both in industry and in the affairs of society generally is necessary than was currently regarded as necessary or even possible 100 years ago.

The phrase "socialistic legislation" again is frequently used to cover almost any extension of governmental activity in the sphere either of industry or of provision under the State or under local government auspices for the needs of the people. The phrase "socialistic taxation" is used, with a greater approximation to accuracy, in reference to those forms of taxation which aim not merely at producing revenue for the public authorities, but at bringing about an actual readjustment in the distribution of income in the community, arrived at by the unregulated operation of capitalist economic forces. Again, almost any extension in the sphere of local government action, such as the taking over of a tramway system or the establishment of banking or insurance facilities by a local authority, is frequently referred to as

"municipal socialism," even if the public body which inaugurates this policy does not consist of members who profess any allegiance to, or have any sympathy with, the doctrines of any Socialist party or group. All these and similar uses of the word "Socialism" are here ruled out of consideration.

The word "Socialism" first came into use in the third or fourth decade of the 19th century in England and France. The first-known literary reference to it occurs in the "Poor Man's Guardian" in 1833; but it is believed that the word was occasionally used at an earlier date in both France and England. In Great Britain it was most frequently used during the first half of the 19th century in reference to the doctrines associated with the name of Robert Owen and his disciples, and to the theories of the anti-capitalist economists, such as W. Thompson, who were largely affected by Owenite teaching. In France the name similarly attached itself to the doctrines of thinkers of whom the most important were followers of St. Simon and Fourier. Its use then spread much more rapidly on the continent of Europe than in Great Britain, and it was mainly in connexion with the growth of continental Socialist movements (Louis Blanc in 1848; the First International Working Men's Association in the 'sixties and the Paris Commune of 1871) that it was used by English writers, until it was reimported into Great Britain as the name applied to a constructive body of doctrines in the early 'eighties, especially under the auspices of H. M. Hyndman and the Democratic Federation (subsequently the Social Democrat Federation).

It is important to realize that in all its modern meanings the word "Socialism" refers definitely to doctrines and movements which owe their rise to the growth of large-scale production and the capitalist system in industry. It is, indeed, sometimes applied to theories and Utopian speculations, such as those of Sir Thomas More, which have no direct reference to any particular stage of social evolution and are merely attempts to outline the structure of an ideal commonwealth. But, although such Utopias as those of Plato and More may present features of resemblance to the doctrines of modern Socialism, there is no real connexion between these and the theories or attitudes towards property which are sometimes comprehended under the terms "mediaeval Socialism" and "mediaeval Communism." Socialism, as a body of doctrine and as a movement applicable to modern conditions—and these are the senses of the term which matter to the student—made its appearance when the changes in methods of production and transport, which are usually described as the "Industrial Revolution," had created the modern working class or "proletariat," and had caused this class to make the attempt to organize for common protection against the evil effects of new industrial conditions.

Modern Socialism, although it has claimed many adherents belonging to other classes, is thus essentially a working-class or "proletarian" movement, in that it is based upon and directly due to the rise of the "proletariat" as a distinct social class capable of independent class organization and suffering under a sense of injustice and inhibition. The Socialism of the Owenite period serves in certain respects very clearly to reveal this essential character of the movement. Owen himself has indeed been described by subsequent social thinkers—by Marx, for example—as a "Utopian" Socialist; but the rise of the Owenite movement is very clearly and directly traceable to the actual economic conditions of the early 19th century. It was out of his experience as a factory manager and owner at New Lanark and elsewhere that Owen developed his Socialist doctrines; and, in the minds of most of his followers even more than Owen himself, these doctrines possessed always a close and definite relation to the rise of the working class to social consciousness and to the possibility of social power. Thus, while Owen was expounding his doctrine of ideal Coöperative or Socialist communities, and endeavouring to demonstrate by practical experiment possibilities of achieving Socialism by the foundation of such communities in the midst of a rapidly developing capitalist environment, many of those who were most affected by his doctrines were engaged either, as economists, in developing their critique of the current economic theories based on capitalism, or,

\* These figures indicate the volume and page number of the previous article.

as leaders in the new-born working-class movement, in endeavouring to organize the "proletariat" for the winning of control over industry and over the machinery of Society. The Grand National Consolidated Trades Union, in which Owenite ideas played so large a part, was organized by men who were aiming not merely at the protection of the working class in face of the adverse conditions created by the new factory system, but at a definite transformation of the industrial order and the winning of control over industry for the "productive classes." This aim was even more clearly defined in the other great "Owenite" union of the period, the Builder's Union, and its abortive plan of 1833 for the formation of a Grand National Guild of Builders. The Chartist movement, which was largely influenced by Owenite and Socialist ideas, was definitely aiming at the conquest of political power by the organized working class with a view to social transformation.

Socialism in Great Britain thus came into existence as: (1) a challenge to the orthodox economic theories of Ricardo and other writers; and (2) an attempt to win power in Society for the organized working class. It was, however, left for later thinkers, and above all for Karl Marx (1818-83), to take up where they had been dropped by the original English pioneers both the anti-capitalist economic teachings and the endeavour to build up the working-class movement into a constructive force aiming at the transformation of the social order. The Socialism of Karl Marx is frequently contrasted with the Socialism of previous thinkers as being "scientific," whereas their Socialism was "Utopian." But, in fact, Marx's Socialism was very largely based upon that of the earlier thinkers and working-class leaders, although he for the first time formulated into a definite system the views and the policy which they had only suggested and sought after.

All modern Socialism, even that of the schools which repudiate or at least profess no allegiance to Marx, has been profoundly influenced by him. This applies even to those schools of Anarchist Communists and French and Italian Syndicalists who seem to have least in common with Marxian teaching; for, even in their case, many Marxian ideas have blended with the ideas which they have derived from other Socialist and quasi-Socialist thinkers, such as P. J. Proudhon; and, although they have interpreted the Marxian teaching differently, a great deal of it has found its way into their systems and policies.

Marx's first important contribution to Socialist thinking, *The Communist Manifesto* (1847), which was drafted jointly by him and Friedrich Engels, is generally recognized as the starting point of the modern Socialist movement. His *Das Kapital*, of which the first volume was published in 1867, is the working-out into a system of the most vital ideas originally presented in *The Communist Manifesto*. These works have, of course, been translated into practically all European languages, and their ideas have generally passed into the common stock of European Socialist thought. This has hitherto been true of Great Britain in a less degree than of any other important industrial country; but even English Socialism began in the 'eighties on an essentially Marxian foundation, and, although Marx fell into disfavour with British Socialists in the 'nineties and in the earlier years of the present century, there has recently been an important revival of the study of his works among the more radical section of the British working-class movement. In other countries the organized Socialist movement is in practically all cases definitely Marxian, and bases its thinking and its propaganda throughout on Marxian terminology and Marxian ideas. Thus we find that, as divergent currents have again and again appeared in European Socialism, the name of Marx and his fundamental conceptions have been invoked, for the purpose of justifying widely divergent policies and conceptions. During the past few years, for example, a great pamphleteering controversy has been proceeding between Nikolai Lenin on the one side and Karl Kautsky on the other, representing two very different tendencies in European Socialism. Each of these writers bases his contentions on an almost theological reverence for the words of Marx, and seeks to justify his position by copious quotations from Marx's books and manifestos.

In the criticism which has been directed against Marx by orthodox economists in many countries, attention has been paid mainly to his theory of value, and only in a considerably less degree to his theory of history. This is unfortunate; for there is no doubt that the theory of value has played a quite secondary part to the so-called "materialist conception of history" in the influence which Marx's teaching has exercised on the modern working-class movement. The theory of value, as it was presented by Marx, and his attempt to build a theoretical economic system on the idea of labour as the source of value and exploitation as consisting in the appropriation by a privileged class, the owners of the means of production, of the surplus value created by labour, was mainly a criticism and inversion, to suit Socialist ends, of the current economics of Marx's own day. Like Thompson and the earlier English economists to whom he owed so much, Marx took the Ricardian theory of value and drew from it conclusions by no means acceptable to orthodox economic theorists. Undoubtedly his ideas of "surplus value," and exploitation resulting from the individual appropriation of "surplus value," played an important part in creating the sense of injustice and oppression among the workers; but by themselves they would never have sufficed to give Marx his dominant position as the theorist of modern Socialism.

This position depends far more on his theory of history, the effect of which was to give to those members of the working class who encountered his teaching the sense of possessing a mission and of having on their side the great world forces of social transformation. Interpreting historical changes as the result of the operation of economic forces, Marx insisted that to each stage in the evolution of the means of production there corresponds an evolution in the forms of political society and in the class structure of society. The industrial system of the 19th century, he claimed, had called into existence a new social class, the propertyless, wage-earning "proletariat"; for, although there had been capitalists and wage-earners in earlier stages of social evolution, the economic structure of Society had not before been based upon the dominance of the capitalists as a class. Nor had the "proletariat" been called into existence as a class, confronting the possessing capitalists throughout the industrial system in all the countries of the world which had reached the capitalist phase. The next stage in social evolution, according to Marx, would be the rise to power of the "proletariat," and, just as the capitalists had risen to power and displaced or absorbed the privileged classes with which social authority had previously rested, so the "proletariat" under the system of large-scale industry would improve its organization and increase its strength until it was able to do battle with, and to overthrow, the capitalist class. In expounding this theory of "economic determinism" or the "materialist conception of history," Marx made a number of prophecies concerning the actual future of capitalist industrialism which have not thus far been at all completely verified. The progressive elimination of the small capitalist, the aggregation of the control of capital into fewer and fewer hands, the progressive "misery" of the "proletariat," which Marx prophesied, are forecasts in which truth and falsehood are intertwined. But these prophecies concerning the actual course of events are in no sense vital to his central idea, which is that of the gradual rise to power of the "proletariat" or working class, and the conquest by it of economic authority, resulting necessarily in the transformation of the political structure of Society and in the abolition of social classes.

It is easy to see that this doctrine was bound to exercise a strong fascination over the minds of those men and women of the working classes who were brought into contact with it. Whereas, without some such theory they were conscious only of the enormous strength of the forces to which they were subject, and of their manifest weakness as almost propertyless wage-earners, living in constant insecurity, at the mercy of trade fluctuations which resulted periodically in widespread unemployment, Marx gave them the sense of fulfilling an historic mission, and of having on their side a world-force far more powerful than the huge economic and political strength which seemed to be in

the possession of the ruling classes of the day. It is this one thing, and one thing only, that explains the veneration in which Marx is held throughout practically the whole Socialist movement. It was he, who, more than anyone else, gave the working class a sense of power, and imported into their efforts towards organization and concerted resistance to the evils to which they found themselves subject a conscious purpose not merely of combating capitalism, but also of replacing it.

In the earlier article some account was given of the rise of Socialist parties in various European countries. This rise continued at an increasing pace in later years, a great impetus having been given to the Socialist forces in almost all parts of Europe by the circumstances of the World War.

There was in 1921 in every industrialized country at least one Socialist party, possessing in the majority of cases a considerable representation in its national Parliament. Indeed, in many countries there had come into being more than one Socialist party; for the process of unification of Socialist political forces which had been proceeding steadily up to the outbreak of the war gave place to a separatist tendency, which resulted in a regrouping of forces in most of the countries in which the movement was strong. The first cause of these divisions was the attitude of Socialists towards the outbreak of the World War. In almost all belligerent countries the Socialist parties became divided over the issues of the war. In some cases these divisions of opinion resulted in actual cleavages within the various parties; in others the parties held together, but acute divisions of opinion continued inside them. These differences were greatly accentuated by the Russian revolutions of 1917, which inevitably exercised a very powerful influence on Socialist opinion throughout the world. Just as, in its earlier days as an organized political movement, Socialism always tended to look back to the Paris Commune of 1871, it now even more definitely looks back to the Russian revolutions of 1917, upon which the most acute divisions of opinion in the world of Socialism to-day are based. Any attempt, therefore, to analyze the forces at work in the Socialist movement of the various countries in 1921 must begin by taking into account the new alignment of opinion caused by the Russian revolutions.

The first Russian revolution of 1917 was universally acclaimed by Socialists throughout the world. It meant for them the overthrow of Tsardom and the destruction of the most powerful and complete absolutist monarchy left in the world. Moreover, refugees from Russia had played an important part in the Socialist movement in almost all countries in which it had become organized. It was not the first of the Russian revolutions but the coup of Nov. 1917 that divided acutely the Socialists of the various countries. Everywhere the left wing of the Socialists acclaimed the Bolshevik Revolution, while the right wing was hostile to what it regarded as the overthrow of the "democratic" institutions which had been introduced under the Kerensky regime.

During the following years, from 1918-21, the differences within the Socialist ranks resulting from the Bolshevik Revolution were steadily accentuated. Under the auspices of the Russian Bolsheviks, or Communists as they now call themselves, with a definite reference back to *The Communist Manifesto* of 1847, a new international organization of Socialism, the Third or Moscow International, was inaugurated, and an appeal was made to the "proletariat" in all countries to rally to this new body, of which the fundamental ideas were the overthrow of the capitalist regime by the intensive prosecution of the class war, involving the use of force, and the assumption by the "proletariat" of dictatorship over Society during the "transitional period," which would be necessary both for the combating of the attempts of the "counter-revolution" to regain power, and for the laying of the foundations of a Socialist or Communist society free from class distinctions. During the years after the Bolshevik Revolution these Communist doctrines gradually spread over Europe, and resulted in the formation in most countries of Communist groups and parties of varying degrees of importance. Sometimes these began by working as groups within the existing Socialist parties, and sometimes they succeeded in winning over to their side a majority of the older Socialist parties, which thus

became Communist. In other cases, however, the Communists, unable to command a majority in the Socialist parties in other countries, founded new and rival parties of their own.

Thus in 1921 the position of European Socialism was extraordinarily complicated, as a reference to the state of affairs in a few of the principal countries will readily indicate. In France the Communists had succeeded in securing a majority in the ranks of the French Socialist party, and it had thereupon changed its name to the French Communist party. The minority, which refused to accept the change in name and policy, thereupon reformed the Socialist party as a coalition of right wing and central elements. In Italy the Socialist party, which was throughout opposed to Italian participation in the war, at first affiliated to the Moscow International; but subsequently differences arose as to the strategy to be adopted, and these led to a split in the ranks of the party, the extreme Communists, who were in a minority, seceding and forming a Communist party of their own, while the right and centre, including many Communists, held together as the Italian Socialist party. In Germany the Social Democratic party split during the war. A majority section of the party supported the German Government in the prosecution of the war and voted war credits. Gradually a minority party formed, and finally the anti-war elements left the Social Democratic party and formed the Independent Socialist party. After the Bolshevik Revolution in Russia two small Communist parties were also formed in Germany. In 1920 the majority of the Independent Socialist party resolved upon adhesion to the Moscow International and united with the Communist factions to form the German Communist party. The right wing of the Independent Socialist party continued in existence under the old name; and there were thus in Germany, in 1921, three distinct parties, Social Democrats or Majority Socialists, Independent Socialists, and Communists. In Great Britain the position was somewhat different; for political action was taken through the Labour party, a federation of trade unions, Socialist societies and kindred bodies. Of the Socialist societies, the British Socialist party, the direct descendant of the Social Democratic Federation, the earliest Socialist body in Great Britain, affiliated to the Moscow International and became the nucleus of a Communist party which applied for affiliation to the Labour party, but was refused. The Independent Labour party, which, unlike the Labour party as a whole, was hostile to participation in the war, nevertheless remained affiliated to the Labour party. There were thus only two groups undertaking political action in Great Britain—the Labour party, including the Independent Labour party, on the one hand, and the small, but militant, Communist party on the other.

These instances, drawn from a very much larger number, serve to illustrate the general character of the divisions which had arisen in the world Socialist movement since the Russian Revolutions of 1917. As the movement has been divided nationally, so a division has taken place in the international organization of Socialism. Before the war most of the Socialist parties of the world were loosely held together by the Congresses of the "Second International," of which the first was held in 1889. Out of the Congresses developed the International Socialist Bureau, which was formed in 1900. The Bureau was unable to function effectively during the war, both because communications were to a large extent interrupted, and because of the differences of opinion between and among the various national sections. Various attempts were made to secure united action by all the national Socialist parties; but, in face of the opposition of the Governments and of internal differences, these produced little result, the attempt to call an International Socialist conference at Stockholm in 1918 breaking down. The Socialist parties of the Allied countries, however, held a number of conferences, and drew up a declaration of war aims, which exercised a certain influence. Immediately on the conclusion of hostilities steps were taken to convene a full International Socialist conference, and an attempt was made to reform the pre-war Socialist International. The reformed body, however, known as the "Second International," never became, in face of acute differences

of opinion, at all fully representative, and during 1919 and 1920 there were numerous secessions from it, until it came to consist principally of the British Labour party, the German Social Democratic party (Majority Socialists), and the Socialist parties of a number of small countries such as Sweden, Poland, Belgium and Holland. A number of Socialist parties held aloof both from the Second and from the Third International, and these bodies in 1920 formed a provisional International "Working Union," of which the aim was the reconstitution at a later stage of a fully representative and inclusive Socialist International. This provisional body, sometimes known as the "Vienna International," includes the British Independent Labour party, the German Independent Socialist party, the French and Swiss Socialist parties, and a number of others. The Italian Socialists were in 1921 unconnected with any of the three Internationals.

There can be no doubt that the division of opinion in the Socialist ranks which is reflected in these divisions in national and international organization is very profound. With the growth of parliamentary representation, the political Socialist parties of the various countries have been becoming steadily more moderate and constitutional in their outlook. But the Moscow revolution, accomplished by insurrectionary methods and by "proletarian" direct action, represented a challenge to the constitutional political attitude of the more orthodox Socialist parties. Those which have rallied to the call of Moscow profess to be the only true inheritors of the Marxian tradition and the legitimate successors of the International Working Men's Association, or "First International," of 1864. It is still impossible in 1921 to forecast the result of the conflicts between this section and the older Socialist parties; but it seems likely that the divisions which have come into existence will be to a considerable extent permanent, even if the ultimate point of cleavage has not yet been discovered.

James Bonar on p. 301 of vol. 25 defines Socialism as "that policy or theory which aims at securing by the action of the central democratic authority a better distribution and, in due subordination thereunto, a better production of wealth than now prevails." It will be clear from what has been said above that this definition is certainly no longer adequate or correct in 1921, even if it could be regarded as adequate at the time at which it was made. It is as true now as then that all schools of Socialism are united in seeking a better distribution and also a better production of wealth; but it cannot be assumed that this is sought solely or even mainly "through the action of the central democratic authority," or that many Socialists would agree that any such body as a "central democratic body" exists in the community as it is organized to-day. Any present-day definition of Socialism would certainly have to emphasize the fact that it seeks not merely a better distribution and production of wealth, but a fundamental reorganization in the whole system of organized Society, political as well as economic. At the time when Bonar wrote, Socialists, especially in Great Britain, were largely engaged in combating the still prevalent doctrines of *laissez-faire* politicians and economists, and in seeking to emphasize the necessity for a greater measure of collective regulation of the social and economic life of the community. In Great Britain, more than elsewhere, many Socialists came to regard the political State, or machinery of government, as the principal instrument of this regulation, and to look forward to the transition to Socialism mainly through the nationalization, or transference to State ownership, of all vital industries and services, together with an extension of municipal ownership in the sphere of local public-utility services. This idea of the form of the transition to Socialism fitted in well with the stress which was laid, during the 'nineties and the earlier years of the 20th century, upon political action. This period witnessed the formation, first of the Independent Labour party, and then in 1900 of the Labour Representation Committee, which subsequently became the Labour party. It was also the period during which the Fabian Society, with its propaganda of political permeation, largely influenced British Socialism, and diverted it from the Marxism of its earlier development in the 'eighties.

But from 1910 onwards new currents of opinion were increasingly affecting these accepted dogmas of Socialism, both in Great Britain and elsewhere. Important, in this connexion, is the rise of the Syndicalist movement in France, which was at its zenith in the earlier years of the 20th century, and of the Socialist Labour party and the Industrial Workers of the World in the United States of America. There were important differences between the standpoints of French Syndicalism, which was derived largely from the semi-Anarchist doctrines of Proudhon and his school, and American Industrial Unionism, based by Daniel De Leon and his followers upon the large-scale and "trustified" American capitalist system. But they were alike in stressing rather the economic than the political character of the transition to a Socialist system, and in demanding more aggressive action by the workers in the industrial field. In Great Britain and in other European countries these doctrines, although they were not accepted in their completeness, exercised a powerful influence, seen especially in Great Britain in the rise of the Guild Socialist movement after 1912 (see GUILD SOCIALISM).

Whereas Syndicalism and, in some of its forms, Industrial Unionism directly challenged the utility of Socialist political action and demanded an exclusive concentration upon the industrial field, the Guild Socialists never took up this attitude, but sought, without disparaging political action, to secure an intensification of industrial activity, and in particular a change in the attitude of Socialists towards the problem of industrial control. Their influence in this direction has extended far beyond their own ranks, and it is not too much to say that the effect of the various movements possessing largely an industrial character—Syndicalism, Industrial Unionism, Guild Socialism, etc.—has been to bring about a revolution in Socialist thinking on this question. It is no longer assumed by Socialists that nationalization is necessarily desirable, or that the transference of industry to the State, even if it be accomplished by a political victory of Socialists, furnishes an adequate solution of the industrial problem. Most Socialists are agreed in desiring, in a greater or less degree, as an integral part of any Socialist system, the control of the administration of industry by the organized workers by hand and brain who are engaged in it.

Nor has this change in the attitude of Socialists towards the problem of industry been without its effect in other spheres of policy. As Socialism passed from its earlier revolutionary into its middle purely constitutional and political phase, it came gradually to be assumed that the realization of Socialism would involve only the capture of political power by the Socialist parties and the use of the existing machinery of Society—modified perhaps in certain particulars, but remaining essentially the same—for socialist instead of for individualist ends. There is now acute division of opinion on this question; but most Socialists are far more ready than in 1910 to agree that the realization of Socialism would involve not a mere conquest of political power and the assumption of control over the machinery of government by the workers, but also a profound transformation in the machinery of government itself. By Lenin and the Communists (see Lenin's *The State and Revolution* for the best statement of this point of view) the State is regarded as purely a "capitalist organ," the tool of a dominant class in Society. In the words of *The Communist Manifesto*, they regard the State as "an Executive Committee for administering the affairs of the whole governing class." Such an instrument, essentially coercive in its character, will in their view become unnecessary with the realization of Socialism. During the transitional period of "dictatorship" the "proletariat" will indeed require an instrument fully as coercive as the capitalist State. But the Communist view of the existing machinery of the State cannot be adapted for this purpose, but must be destroyed and replaced by a "quasi-State" based definitely and exclusively upon the power of the workers themselves. Gradually, as the realization of Socialism comes nearer, they hold that this "quasi-State" will "wither away" and give place to a free organization of Society in which "government," which they understand to imply a system based on coercion, will be replaced by "administration." Even among those Socialists

who do not accept this Communist view, keen criticism has been directed in recent times upon the structure of the present-day State and upon the conception of political democracy which was almost universally accepted in the 19th century. Universal political suffrage is no longer held to furnish any adequate basis, or even necessarily any basis at all, for truly democratic institutions; for it is pointed out that, as long as great inequalities of wealth and power exist in the community, and as long as the industrial system is based on an acute division of classes, this "political democracy" is in fact inoperative, since the power and wealth of the few can be used in order to prevent the will of the people from finding expression, and, indeed, to prevent the people from developing any conscious or clearly formulated will of its own. By the Guild Socialists and by many others of the newer schools of Socialist thought, stress is laid upon the importance of securing a system of democratic self-government in the industrial sphere as the necessary condition of democracy in politics or in Society as a whole.

These changes in the conception of Socialist aim and method have resulted in a much closer relationship between Socialist ideas and the definitely economic forms of working-class organization, such as Trade Unionism and Coöperation. No longer basing their hopes of Socialism entirely upon action in the political sphere, Socialists are driven more and more to rely on the development of the organizations created by the working classes themselves for the protection of their interests and standard of life under capitalism. Whereas the earlier Socialists appealed to Trade Unionists and Coöperators to realize the necessity for Socialism and to embark upon political action, the newer schools of Socialism are endeavouring also to influence the policy of the Trade Unions and of the Coöperative movement in the direction of Socialism applied to industry—that is, of the development and expansion of working-class industrial control (see TRADE UNIONISM and GUILD SOCIALISM).

The organization of the Socialist movement in Great Britain is often exceedingly bewildering to those who approach it for the first time. There are a large number of bodies of varying degrees of importance, and often with names which bear a close resemblance one to another. The Labour party, which is by far the largest political body, may be regarded as definitely Socialist in the sense in which the majority of continental European Socialist parties are Socialist. Its annual conference has repeatedly pronounced, in general terms, in favour of Socialism, and its policy on the whole coincides with that of the "right wing" Socialist parties of Europe. At the same time, its main strength is drawn from the trade unions. In 1920 it consisted of 126 affiliated trade unions with a total affiliated membership of 3,511,000. In addition it included the Independent Labour party and the Fabian Society and one or two smaller Socialist bodies. Locally it was organized in several hundred Local Labour parties, which in their turn consisted mainly of affiliated branches of trade unions, Socialist societies and kindred bodies. These Local Labour parties, under the new constitution of 1918, also admit individual members who accept the aims of the party. There is a very considerable individual membership enrolled in this way; but no figures are available. In 1920 the Labour party had 66 members in the House of Commons.

Apart from the Labour party, although in some cases affiliated to it, are the various Socialist societies, of which the largest is still the Independent Labour party, which has been mentioned above. This party had in 1920 35,000 members organized in local branches throughout the country. It had returned five members as Independent Labour party members to the House of Commons; and these sat as members of the Labour party. In addition a considerable number of members who were returned under the auspices of the trade unions, affiliated to the Labour party, belonged to the Independent Labour party.

Next in point of size stands the Communist party of Great Britain, formed in 1920 by a fusion of the British Socialist party with a number of local Communist organizations. This party is affiliated to the Third or Moscow International. It was gaining adherents in 1921. Its total membership, however, certainly did

not at that date exceed 10,000. Of minor Socialist parties the following deserve mention. The Social Democratic Federation, formerly the National Socialist party, is the result of a split which took place during the war in the British Socialist party. A section of the British Socialist party, including H. M. Hyndman, the veteran Socialist leader, and many of the older members of the earlier Social Democratic Federation, resigned from the British Socialist party as a protest against its anti-war attitude and formed a separate body of their own. The Social Democratic Federation (the name was again assumed at the end of 1920) is affiliated to the Labour party. It is very small, its membership in 1920 being returned as 2,000.

The Fabian Society, founded in 1883-4, has been principally associated with certain intellectual leaders of the right wing of British Socialism, especially Mr. and Mrs. Sidney Webb and Mr. Bernard Shaw. It had about 2,000 members in 1920 and was affiliated to the Labour party. Its pamphlets and other propagandist work exercised a powerful influence on the formation of Socialist opinion during the period from 1880 to 1910, but it has since ceased to count as an effective influence; for, although Mr. and Mrs. Webb and other leaders remained active, they had transferred their main activities to other bodies, such as the Labour party itself.

The Socialist Labour party is an offshoot of the American "De Leonite" Socialist Labour party. It gained considerably in membership and influence during the war, when its leading members took a prominent part in the shop-stewards' movement, and in other rank-and-file trade-union and anti-war movements. Most of its more active members, however, passed over to the Communist party in 1920; and it then ceased to exercise any considerable influence. The Socialist party of Great Britain is a very small and unimportant body of rigid Marxians of the extreme left wing. The National Guilds League, the propagandist organization of the Guild Socialists, is described in the article GUILD SOCIALISM.

It will be seen from the foregoing account that the Socialist movements of the world were in 1921 in a state of unrest and transition, due largely to the events of the war and to the revolutions in Russia. It is impossible to forecast what will be the ultimate result of this ferment of forces and ideas, or in what manner the Socialist parties and societies of the world will eventually regroup themselves. Two clearly defined tendencies can be seen in the movement. The first is a constitutionalist and parliamentary tendency, expressing itself in the activities of the Majority Socialist parties of many countries. Its adherents repudiate for the most part recourse to revolutionary methods save under quite exceptional circumstances. At the other extreme is the tendency represented by Communism and the Communist parties which have arisen in most countries in recent years. Its adherents favour the use of political as well as industrial action, but regard the transition to Socialism essentially in terms of force to be generated by the uprising of the "proletariat." They envisage the transformation of Society by a catastrophic overthrow of the existing political and economic system, and the substitution for it of a new system based on the "dictatorship of the proletariat." Between these two extremes there is no equally definite central body of opinion extending to a number of countries; but in almost every country there are "centrist" groups and tendencies, bearing in some cases a closer resemblance to the constitutionalist right wing (e.g. the Independent Labour party in Great Britain), and in others to the revolutionary left wing (e.g. the Socialist party in Italy).

The Guild Socialists and, in a less degree, the French *Syndicalistes* stand to a considerable extent in a different position, since in their case the main stress is laid neither on revolution nor on constitutional political action, but on the extension of the industrial power of the workers towards control over industry.

A marked feature of the more recent developments of the Socialist movement has been the growing closeness of the relationship between it and the economic organizations created by the workers for the defence of their interests and aspirations as producers and consumers. It has become far more manifest

in the later years of the 19th and the early years of the 20th century that Socialism is not solely, or even mainly, a political movement, but at least equally an industrial movement, aiming at a fundamental transformation not simply in the ownership, but also in the control and administration of industry, and in the motives upon which the industrial system depends. This is, indeed, to some extent a harking back to earlier conceptions of Socialism, such as those of Robert Owen in Great Britain and of Louis Blanc in France. It has resulted in a far closer affiliation between the Socialists of all schools, "right wing," "left wing" and "centre" alike, and the trade-union movement; and the struggles between the rival schools of Socialism now largely reproduce themselves in the industrial sphere, as the various Socialist sections seek to influence the policy and to secure the allegiance of the trade-union organizations. This is true to a less extent of the coöperative movement; but it is becoming increasingly true in this case also.

Based, as it is, mainly upon the organized working-class movement, Socialism has necessarily, to a large extent, an economic basis; but it is important to realize that a great deal of its driving force comes from the fact that it is not only an economic movement, but also a movement based on certain clear and definite ideas which are largely shared by Socialists of all schools.

The differences between Socialists are far more differences as to method than differences as to ideal. Thus all Socialists are agreed that the carrying-on of industry on a basis of private profit produces anti-social results, and that the idea that the interests of the whole are best served by the enlightened pursuit by each private citizen of his own interests is fundamentally wrong. Although they differ widely as to the structure which a Socialist society should assume, and as to the forms of industrial administration which would best express the new community spirit, Socialists are agreed in demanding that all important industries and services should pass over from private hands into some form of social ownership and control, whether into the hands of the State or of local authorities, or of self-governing guilds, or of the coöperative movement, or of other forms of organization designed to express the communal spirit. They are agreed in believing the individual ownership of the means of production, distribution and exchange to be undesirable, and in holding that both the extent and the character of production should be determined, not by any anticipation of individual profit, but by considerations of social need. Moreover, all Socialists insist that with the change from the system of private ownership and control in industry to social ownership and control must go a change in the motives which operate in the industrial system. They hold that, if industries and services are conducted under forms of organization designed in the interests of the whole community, the motive of public service, which is at present thwarted and inhibited by the existence of capitalism, will be brought into play, with the result that the members of the community will be more ready to render willing and efficient service. They are also increasingly of the opinion, first strongly urged by the Guild Socialists, that in order to bring this motive of social service into play it will be essential to democratize the industrial as well as the political system, by providing for a large measure of self-government in industry by the "workers by hand and brain."

The charge used to be brought against the Socialist parties and groups of dwelling almost exclusively upon the economic concerns of Society, and of caring little or nothing for other questions of social and political policy. This charge can hardly be made nowadays; for the Socialist and Labour parties of the world have in almost all cases been led to formulate inclusive programmes and policies, and to take an active part in furthering social reorganization in all spheres of both national and international policy. Perhaps the best exposition of the national and international policy of Socialism of the constitutional type is contained in the pamphlet *Labour and the New Social Order*, issued by the British Labour party in 1918. This pamphlet has had an important international influence. The Communist wing, more fully preoccupied with questions of revolution

than with plans for reform under the existing system, has not issued any quite comparable declaration of its aims; but the new *Communist Manifesto* of the Third (Moscow) International furnishes the clearest indication of its aims and policy as an international movement.

**BOOKS ON SOCIALISM.**—A. General.—There is no really good account of Socialism as a whole. The handiest text-books in English are: T. Kirkup, *History of Socialism* (new ed. revised by Edward R. Pease, 1913); and Werner Sombart, *Socialism and the Social Movement* (translated by M. Epstein (1909); R. C. K. Ensor, *Modern Socialism* (1907), is a useful collection of extracts from writings of Socialists of all countries. Max Beer's *History of British Socialism* (2 vols., 1919 and 1920) is indispensable. For the growth of the movement in various countries see Robert Hunter, *Socialists at Work* (1908), and the *Labour International Handbook*, prepared by the Labour Research Department (1921). Of books hostile to Socialism the best known are O. D. Skelton, *Socialism: a Critical Analysis* (1911), and W. H. Mallock, *A Critical Examination of Socialism* (1907); Hartley Withers, *The Case for Capitalism* (1920), may also be consulted. Other useful general books include: E. Bernstein, *Evolutionary Socialism* (1909); Robert Blatchford, *Merrie England* (1895); Fabian Society, *Fabian Essays* (1889); J. Bruce Glasier, *The Meaning of Socialism* (1920); Laurence Gronlund, *The Coöperative Commonwealth*, edited by Bernard Shaw (1891); J. Ramsay MacDonald, *Socialism, Critical and Constructive* (1921); William Morris and E. Bellort Bax, *Socialism: its Growth and Outcome* (1893); Bertrand Russell, *Roads to Freedom* (1918); Emile Vandervelde, *Collectivism and Industrial Evolution* (1907); *Le Socialisme contre l'Etat* (1919); W. E. Walling, *Socialism as it is* (1912); H. G. Wells, *New Worlds for Old* (1908, rev. 1914). See also the innumerable pamphlets published by the various Socialist bodies.

B. Marxism.—Karl Marx's *Capital* (English translation, 3 vols. 1887–1909) is, of course, the foundation of most modern Socialist thinking. Of Marx's other works the most important for Socialist theory are: *The Communist Manifesto*, written in collaboration with Friedrich Engels (1847); *The Critique of Political Economy* (English translation, vol. ii. 1907); *The Civil War in France* (1871, reissued 1921); *Revolution and Counter-Revolution or Germany in 1848* (Eng. 1896); *The Poverty of Philosophy* (Eng. 1900). Of the works of Engels the most important are: *Socialism, Utopian and Scientific* (Eng. 1892), and *Landmarks of Scientific Socialism* (Eng. 1907). Karl Kautsky, the leading exponent of political Marxism in Germany, can be best studied in *The Erfurt Program* (Eng. 1910); *The Social Revolution* (Eng. 1902); and in his attack on Bolshevism, *Terrorism and Communism* (Eng. 1920). For the Communist exposition of Marxism see N. Lenin, *The State and Revolution* (Eng. 1919), and other works. Of books on Marx and Marxism the most important are: Max Beer, *The Life and Teaching of Karl Marx* (Eng. 1921); Achille Loria, *Karl Marx* (Eng. 1920), and for a hostile criticism: E. von Böhm-Bawerk, *Karl Marx and the Close of his System* (Eng. 1898). Georges Sorel's *La Décomposition du Marxisme* (1908) and Benedetto Croce's *Historic Materialism and the Economics of Karl Marx* (Eng. 1914) are important detached studies. A much fuller bibliography will be found in *What to Read on Social and Economic Subjects* (Fabian Society, new ed. 1920); and reference should be made to the bibliographies at the end of the articles on COMMUNISM, GUILD SOCIALISM, SYNDICALISM. There is, of course, a very large literature of the subject in almost every European language.

(G. D. H. C.)

**SODEN, HERMANN, FREIHERR VON** (1852–1914), German biblical scholar (see 25.339), died Jan. 15 1914.

**SOLDENE, EMILY** (1840–1912), English singer and actress, was born at Islington, London, in 1840. She had made her debut in 1864 on the concert stage, and in 1871 appeared in *Genevieve de Brabant*, her favourite rôle, and in *La Fille de Madame Angot* in 1872. Her successes were mainly in opera-bouffe, and she retired young from the stage. She published one novel, *Young Mrs. Staples* (1896), and *My Theatrical and Musical Recollections* (1897). She died in London April 8 1912.

**SOLF, WILHELM** (1862– ), German colonial politician, and, at the time of the revolution, Secretary of State for Foreign Affairs, was born Oct. 5 1862 in Berlin. He made a special study of Sanskrit and Oriental languages, and, after a long sojourn at Calcutta, returned to Germany in order to study political science. He then entered the German Colonial Service and, after having been employed in a judicial post in German East Africa, was sent to Samoa, first as president of the municipal council (1899) at Apia under the old "condominium" of Great Britain, Germany and America and afterwards as governor of German Samoa (1900). In 1911 he was appointed German colonial secretary and achieved considerable success in the reform of the German colonial administration. When Prince Max of Baden's Ministry

of desperation was formed towards the end of the World War. Solf was appointed Secretary of State for Foreign Affairs on Oct. 3 1918. In this capacity it fell to his lot to conduct the negotiations for the Armistice, first with President Wilson and then with the Allied and Associated Powers. He continued to hold this office as an "expert" under the revolutionary Socialist Government of the Commissioners of the People, and did not resign till Dec. 17 1918. In 1920 he was appointed German chargé d'affaires and afterwards ambassador to Tokio. He was the author of *Weltpolitik und Kolonialpolitik* (1918) and of *Kolonialpolitik, Mein politisches Vermächtniss* (1919).

**SOMALILAND** (see 25.378).—The territorial division of Somaliland between Abyssinia, Great Britain, France and Italy, except for a comparatively slight readjustment of the Italo-Abyssinian frontier, remained unchanged during the period 1910–21. However, Italy obtained from Great Britain the promise of the addition to Italian Somaliland of part of the Jubaland province of British East Africa (Kenya Colony). Italy also desired to acquire the port of Jibuti (French Somaliland), but failed to do so (see *AFRICA: History*).

**BRITISH SOMALILAND.**—From 1910 to 1920 the mullah Mahommed bin Abdullah, popularly known in Britain as the "Mad Mullah," continued to dominate the interior of the protectorate. In March 1910 the British troops were withdrawn to the seaports and a policy of "strict coastal concentration" adopted. Official arrangements had been made to enable the friendly tribes to defend themselves from attack by the Mullah; in fact the "friendlies" were not only systematically raided by the dervishes, but also quarrelled among themselves. At the end of 1912 a camel constabulary, 150 strong, was raised and under R. C. Corfield checked inter-tribal fighting. In Aug. 1913 Corfield, acting against instructions, engaged a raiding party of some 200 dervishes at a place called Dolmadoba, 110 m. S.E. of Berbera. In the action Corfield was killed, his little force of 100 men had over 50% casualties and was compelled to fall back. G. F. Archer, the acting commissioner, rode out from Burao (40 m. distant) with an escort of 20 Indian troops and covered the retreat. The dervishes proceeded to occupy some of the chief grazing ground of the "friendlies" and the Mullah built strong forts at Jidballi and Shimber Berris—places in the S.E. part of the British protectorate, Jidballi being 220 m. S.E. of Berbera. In March 1914 dervish raiders reached the coast and fired into the town of Berbera. Archer, who in May 1914 became commissioner of the protectorate<sup>1</sup> in succession to H. A. Byatt, urged that duty should compel Britain to safeguard the tribes in the protectorate and further operations were authorized. Sheikh and Burao were reoccupied and on Nov. 23 Maj. (local Lt.-Col.) T. A. Cubitt defeated the dervishes at Shimber Berris. Cubitt having returned to Burao, the dervishes reoccupied Shimber Berris. Here they were again attacked by Cubitt on Feb. 3–4 1915, and after severe fighting, partly in caves, were driven out and all their forts destroyed. There was no means of following up the Mullah, nor any belief that his power had been crushed, though for over a year after the destruction of Shimber Berris he remained quiescent. His headquarters were at Tale, towards the Italian frontier, where, under the direction of Arab masons from the Yemen, his followers built elaborate stone fortifications of great strength.

Subsequently the Mullah again overran the centre and east of the protectorate, building more forts and making many raids on the "friendlies." This state of affairs lasted until 1920, when carefully planned and ably executed operations resulted in the complete destruction of the Mullah's forces. The Mullah had, in Sept. 1919, suddenly moved northward from Tale to Jidballi with most of his fighting men, establishing his own camp in the hills at Medishe, 12 m. N.W. of Jidballi. This move, occasioned by the hostility of the Mijertin Somalis, proved advantageous to the British plans. The main attack was made from the air, the force employed being one flight of DH9 aeroplanes under Group-Capt. R. Gordon. The ground troops were a King's African Rifles contingent (700 rifles), the Somaliland Camel Corps (700 rifles) and the 1st 101st Grenadiers, Indian

Army (400 rifles). Lt.-Col. G. H. Summers was in command, the whole operations being, apart from the initial attacks by the air force, under the personal direction of Archer. Hostilities began on Jan. 21 with an aerial attack on the Mullah's camp at Medishe and ended on Feb. 12 with the flight of the Mullah, his eldest son, a brother and four or five followers. The rest of his followers were killed or captured, together with all his stock and property of every kind. The killed included 7 of the Mullah's sons; the captured, his 5 wives, 6 of his sons, 4 daughters and 2 sisters. The British casualties were very slight—3 natives killed and 8 wounded. The cost of these operations was about £84,000. Their success was primarily and mainly due to the Royal Air Force. The dervishes, good fighting men, were demoralized from the start by the attacks from the air and offered no serious opposition. They appeared not to know the character of aeroplanes; when the first attack was made on Medishe the Mullah is reported to have regarded the appearance of the machines in the air as a divine manifestation. It is known that on their approach he collected his people around him and awaited their coming under the white canopy used on state occasions. The first bomb killed an uncle of the Mullah's, who was standing by his side, and singed the Mullah's clothing.

When the British captured Tale (Feb. 9) the Mullah was already in flight, and he succeeded in eluding pursuit with the small following named. He crossed the Haudh to Galadi. News was received in the summer of 1921 that the Mullah had died at Imi in the heart of the Ogaden country the previous Feb., deserted and destitute. The Mullah's defeat was regarded in Somaliland as marking the deliverance of the country from 21 years of dervish oppression. Archer, to whose persistent advocacy this result was due, was created a K.C.M.G.

The World War and the high prices prevailing in 1918–20 had a marked influence on trade, the Somalis exporting large numbers of sheep and goats for the Aden Field Force and many thousands of camels for the Egyptian Expeditionary Force. Apart from this the most valuable export was skins and hides, the Somali skins being of very high quality. The great majority of the skins, especially the sheepskins, went eventually to the American market. The chief imports—American grey sheeting, dates, rice, sugar and tea—showed a heavy decline in quantity during the war, but an increase in value. Trade with Abyssinia continued, but the Zeila route could not compete beyond Harar with the railway-borne traffic through Jibuti. In 1910–1 the total value of imports was £267,000 and of exports £247,000. In 1919–20 the figures were: imports £754,000, exports £346,000 (of which £134,000 was the value of hides). External trade was mainly in the hands of Indians and Arabs.

Revenue was mainly derived from customs and was inadequate to meet the cost of administration. The figures for 1910–1 were: revenue £30,000, expenditure £99,000; for 1919–20 revenue £81,000, expenditure £322,000. Deficits, incurred mainly for military purposes, were met by Imperial grants in aid. There was evidence to show that, with internal peace and a reasonable development of the resources of the country, the protectorate would become self-supporting. It was known to contain oil-fields, favourably reported upon by experts as long ago as 1914. A step towards opening the interior was taken in 1920 when a motor road was made from Berbera (the capital and chief port) to Lower Sheikh and from Upper Sheikh to Burao. See R. E. Drake Brockman, *British Somaliland* (1917); H. F. Prevost Battersby, *Richard Corfield of Somaliland* (1914); A. H. E. Mosse, *My Somali Book* (1913); A. Hamilton, *Somaliland* (1911) and the annual Colonial Office reports on the protectorate. The account of the final overthrow of the Mullah is given in a supplement to the *London Gazette* of Nov. 1 1920.

**FRENCH SOMALILAND.**—Situated on the western shores of the Bab-el-Mandeb, French Somaliland is important as possessing the only French port on the Suez Canal route and as being the main artery of trade with Abyssinia. The pop. in 1917 was estimated at 206,000. Jibuti, the port and capital, had 13,608 inhabitants, of whom 294 were Europeans (107 French).

The resources of the country, which is largely arid, are limited. Date palms have been planted in the desert round Jibuti. Cotton-growing was tried in the same neighbourhood but was abandoned. On the higher ground there is rich grassland, on which the natives—Somali and Danakil—have herds of camels, goats and black-faced sheep. The Bahr 'Asal has been exploited since 1912 for its immense deposits of salt; in 1918 the export was 11,500 metric tons. There is also a considerable fishing industry, and mother-of-pearl fisheries among the exports.

Jibuti is regularly visited by French, British and Italian steamers and has a local service to Aden. In 1917 the steamers entered at

<sup>1</sup> In Oct. 1919 the title was changed to that of governor.

Jibuti numbered 272, with a tonnage of 643,000. About 90% of its trade is the transit of goods to and from Abyssinia, the railway from Jibuti to Addis Abbaba being owned by a French company. In 1913, before the railway had reached Addis Abbaba, the value of the transit trade was £1,636,000. In 1918, with the railway completed, the imports destined for Abyssinia were valued at £1,433,000 and the exports from Abyssinia at £2,622,000. There is also a trade in supplying passing ships with coal, previously imported. Textiles, food-stuffs and coal are the chief imports; the exports are the characteristic produce of Abyssinia—coffee, live stock, hides and skins, ivory, rubber, beeswax, etc.

The colony is administered by a governor assisted by a council composed equally of official and non-official members. The budget for 1919 was balanced at 2,370,000 francs. Relations between the Somali and Danakil and the French proved satisfactory, the tribes being very lightly administered. A small military force was maintained for the security of Jibuti and the railway. The colony was on good relations with its Italian, British and Abyssinian neighbours, save for differences with the Abyssinian customs officials, whose valuation of dutiable goods passing inwards was often arbitrary. Some anxiety was caused in 1917–8 by the presence of Lij Yasu, the deposed Emperor of Abyssinia, in the Danakil country, and by his threats to the railway. His effort to raise the tribes against the French failed.

See the *Côte Française des Somalis* (annual reports by the French Colonial Ministry), and *L'Afrique Française* (monthly).

**ITALIAN SOMALILAND.**—The efforts of Italy in Somaliland during 1910–21 were concentrated upon the southern part of their protectorate. By a royal decree of July 1910 this southern region, Benadir and its hinterland, was constituted a Crown colony, administered by a civil governor resident at Mukdishu (*Ital.* Mogadiscio), and divided into four “commissariats.” This region included the fertile valleys of the lower Juba and Webi Shebeli and the good grazing land on the plateau between those rivers. Dura was the main crop, but cotton and rice plantations were formed along the Juba and aid given to Italian colonization companies. The result was not great; the Somalis preferred a nomadic life, while the agricultural classes, negroes or semi-negroes, were few in number. This paucity of labour was the most serious problem confronting the administration.

By the occupation of strategic posts and the building of roads the Italians secured the safety of Benadir, and with this security a considerable trade developed with Abyssinia, chiefly via Lugh, on the Juba. But the absence of any harbours—all the ports are open roadsteads—proved a great drawback, and to remedy this difficulty Italy had obtained facilities at the harbour of Kismayu, in British East Africa (Kenya), some little distance south of the mouth of the Juba. That river formed the Anglo-Italian frontier. On Dec. 24 1915 an agreement was reached for the appointment of a permanent mixed commission to deal with customs, transit, conservancy, navigation, irrigation and other purposes in the Juba region. Italian desires in respect to the Juba were, however, of a wider character. It was believed that with complete control of the lower Juba—spoken of as a second Nile—the economic future of the colony would be assured, and in the treaty with the Allies which preceded her entry into the World War Italy secured *inter alia* a promise of the rectification of her Somaliland frontier. Formal negotiations to that end were entered upon in 1919, when Great Britain agreed to the cession of Kismayu and of a strip of land which would give Italy both banks of the Juba.

The northern part of Italian Somaliland remained under the rule of Somali chiefs, of whom the most important was the Sultan of the Mijertins, whose territory included the coast facing the Gulf of Aden. The Mijertins, who number approximately 100,000, possess large numbers of camels, sheep and cattle, and their country, as also Obbia and the Nugal territory, abounds in plants which furnish gum-arabic, myrrh, frankincense, etc. The Mijertins were near neighbours of Mahommed bin Abdullah, the “Mad Mullah,” who between 1905 and 1909 was settled in the lower Nugal region. The hostility of the Mijertins finally drove out the Mullah, who established himself at Tale, in the southeast corner of British Somaliland. The continued and unwelcome attentions of the Mijertins induced the Mullah in 1919 to remove farther into the British protectorate, while in 1920 the Mijertin Sultan, Osman Mahmoud, assembled his warriors to prevent the Mullah's reentry into Italian territory.

Italian relations with Abyssinia were satisfactory. Following the Italo-Abyssinian convention of 1908 the frontier was delimited in 1911, tribal boundaries rather than physical features determining the line chosen. In the north, where the frontier reaches the southern limits of British Somaliland, the Italo-Abyssinian frontier was fixed at 48° E., instead of 47° E., as provided in the 1908 agreement. This gave to Abyssinia the small portion of Ogaden tribal lands which had been in the Italian protectorate, including Galadi.

The external trade, valued at £174,000 in 1908–9, had risen to £326,000 in 1912–3, and was £800,000 in 1918. Throughout this period imports greatly exceeded exports, the exports in 1918 for example being valued at £243,000 only. Imports are chiefly cotton goods from Italy and food-stuffs. Skins form, in value, 75% of the exports. The expenses of administration exceed revenue; the Italian grant in aid (£119,000 in 1910–1) was £186,000 in 1920–1, when the budget was balanced at £440,000. Of the expenditure one-fifth was for the military force, some 3,000 strong, sent from Eritrea, the men being Abyssinians.

A 1920 estimate put the total pop. as high as 650,000. Mukdishu had 14,000 inhabitants. Besides a few hundred Europeans there are at the coast towns settlements of Arab and Indian traders. Mukdishu was, in 1915, connected with Massawa by a high-power wireless station. Surveys for railways had been made, but no construction had begun up to 1921. There were in that year some 1,500 m. of road in southern Somaliland.

See G. de Martino (sometime governor of the colony), *La Somalia Nostra* (1913), and *Italian Somaliland*, a British Foreign Office handbook, with bibliography (1920). (F. R. C.)

**SOMERSET, ISABELLA CAROLINE** [LADY HENRY SOMERSET] (1851–1921), English philanthropist, was born in London Aug. 3 1851, the eldest daughter and co-heiress of the 3rd and last Earl Somers. She married in 1873 Lord Henry Somerset, son of the 8th Duke of Beaufort, at one time comptroller of Queen Victoria's household, from whom she later separated. She became well known as a temperance reformer and interested herself deeply in the reclamation of inebriate women, with this end in view founding the Duxhurst Farm Colony, near Reigate, the first settlement of the kind in England. In connexion with it she established a home for destitute children and a “children's village” for saving infant life. Lady Henry Somerset was for many years president of the National British Women's Temperance Association, and made a reputation as an able speaker. In 1894 she founded the *Woman's Signal* in the interests of women's work, becoming its editor, and she was also the author of various children's books and many pamphlets and articles on social work. She died in London March 12 1921.

**SOMME, BATTLES OF THE.**—Under this heading it is proposed to deal with the principal battles which took place in Picardy and southern Artois during the World War. The geographical limits in which these battles took place may be roughly defined as the Scarpe on the N., the Oise on the S., the line Cambrai–La Fère on the E., and the line Amiens–Creil on the W.

The strategic geography of this region is governed by the course of the Somme between St. Quentin and Amiens; in the upper part of this course it runs S.–N., in the lower E.–W., and in that general course it continues to the sea. Thus from Péronne, the point at which the river bends through the right angle, to Abbeville, a water barrier divides opposed armies that face N.–S., and separates each into well-defined tactical theatres if they are operating towards the E. and the W. The upper (or strictly the middle) Somme (Péronne–Ham) prolonged to the Oise by the Crozat Canal, on the other hand separates the E.–W. adversaries and either protects or hampers those operating in N.–S. direction. Thus the operations which took place in the region, profoundly influenced by the alignment of the Somme and its tributaries, are in spite of their dissimilarity, properly designated “battles of the Somme.”

In the first phase of the war, this region was traversed by the German I. Army, and a number of local combats took place between it and the forces that Joffre gathered, little by little, to form his VI. Army and outflank the Germans in their wheel.

More severe and continuous fighting took place between the Oise and the Scarpe during the development of the opposed northern wings in the "Race to the Sea."

Of this the battles of Lassigny, Roye, and Albert, which led up to and even into, the battle of Arras (*see* ARTOIS, BATTLES IN) formed the first phase.

In each locality or area the effort of each side to hold the other frontally, while outflanking him to the N., produced an ever-extending frontal battle that, after see-sawing to and fro, produced the line of stabilization characteristic of the trench warfare period.

In 1915 the line of stabilization between the Oise and the Scarpe was relatively quiet. And apart from a combat in Jan. 1916, in which the French lost possession of Frise, the line, as it was left at the close of the "Race to the Sea" in 1914, was the starting line of the great offensive of July 1 1916.

#### I. BATTLES OF JULY-NOVEMBER 1916

The four months and a half of almost continuous fighting which began with the great attack of July 1 1916 mark a turning-point in the World War in more than one respect. With July 1 1916 began that period of sustained and systematic Allied pressure upon the enemy which, though interrupted in the spring and early summer of 1918 by the desperate German counter-offensive, in the end wore his resistance down. Before July 1916 the Allied offensives had been relatively brief interludes in a long period of stalemate; from that date onwards it was the periods when active operations were in abeyance which formed the interludes. Further it is clear even from the grudging admissions of the German commanders that this great struggle materially affected the strategic situation as no earlier Allied offensive had, that the strain which the maintenance of their defence imposed on the resources and the *moral* of the German armies exercised an important influence on the course of the struggle. The actual gains of ground made by the Allies between July 1-Nov. 19 1916 were not large, but in making them they established a moral ascendancy over their enemy and brought home to the Germans the probability of defeat. And in this struggle the British army had for the first time to bear the major part: the French who fought on Sir Douglas Haig's right with so much gallantry and efficiency played a part of the greatest importance in the battle, but one as distinctly subordinate to the efforts of the British as the British attacks in May and Sept. 1915 had been to those of the French.

To speak, as is the common habit, of "the battle of the Somme" in 1916 is to fall into a natural but serious error. The operations were a series of great battles, each surpassing all those of previous wars in magnitude and intensity, parts of a common whole but still definite and separate operations for distinct purposes. It is possible to distinguish four main phases in the operations: first the winning of a position on the southern edge of the main plateau between the Somme and the Ancre, a matter of three weeks' hard fighting, embracing two attacks on a large scale and many lesser intermediate operations; in the second phase, which lasted till the middle of Sept., nearly two months, the operation took the shape of a contest for this main ridge and for the extension of the footing which the Allies had gained upon it so as to enable them to develop their offensive on both flanks as well as straight to their front; in the third phase the Allies pushed forward across the ridge and down its farther side, only to have their progress arrested by the persistent bad weather which set in about the beginning of Oct. and prevented anything like a general attack upon the rearward system of defences which covered Bapaume and Péronne; the fourth phase of the operations, extending from the beginning of Oct. till Nov. 18, saw a series of smaller efforts against particular points and strongholds, culminating in a bigger attack on Nov. 13 astride the Ancre which completed the reduction of the main ridge and captured ground of vital importance on the right bank of the Ancre. But the main rearward system was not penetrated, thanks largely to the mud which hampered every movement of the attackers and made the performance of the normal adminis-

trative services for the troops in the advanced position a task of the greatest difficulty. The devastating effects of the repeated bombardments made themselves felt over the whole area: houses and whole villages were reduced to ruins; woods were represented by a few shattered stumps and a tangle of broken trunks and branches; roads were rendered impassable till the battlefield became a dreary wilderness of mud and water-logged shell craters. To maintain trenches in defensible condition was all but impossible, to consolidate a captured position, difficult even in dry weather, became practically out of the question. The middle of Nov., therefore, saw active operations broken off and two months elapsed before anything more than quite minor operations became possible. The operations during the two months which preceded the German withdrawal to the Hindenburg line, including as they did a systematic advance up both banks of the Ancre on Bapaume, were essentially the continuation and completion of those of the last phase of the operations of the autumn, and it would be not unreasonable to treat them as yet another stage of "the Somme." They had brought the British practically within striking distance of the last line which covered Bapaume and Péronne when in the middle of March the German retreat anticipated its enforced evacuation.

*First Phase.*—The German positions astride the Somme and Ancre attacked on July 1 1916 were strong by nature and had been made doubly formidable by every device known to the military engineer. Their line represented the positions taken up in Oct. 1914 by the German VI. Army in the course of that "Race to the Sea" which culminated in the desperate fighting of Oct. and Nov. 1914 for Ypres and the Yser. The line then established had remained substantially unchanged, for neither side had since then attempted any operations of importance in this quarter where the British III. Army had relieved the French in front of Albert in July 1915. Hence the Germans had had ample time to develop their defences to the highest degree: villages and woods had become fortresses; two elaborate trench systems, each comprising several lines, had been dug, the second from two to three-miles in rear of the first, "switches"—communication trenches—connected them up and greatly complicated the task of the attacker who should happen to penetrate any part of the front. Deep dug-outs, to the construction of which the chalk country lent itself admirably, gave shelter to the trench garrisons during bombardments; deep belts of barbed wire protected the different trenches, and most careful and skillful arrangements had been made for enfilade and supporting fire from numerous machine-guns; positions of special tactical value had been secured by formidable redoubts, while a well-placed and ample artillery was ready to support the defenders. Moreover, the advantage of the ground lay with the Germans, whose facilities for observation were excellent.

The frontage selected for the attack extended from just N. of Lihons on the extreme right to the Somme at Curlu, a distance of about nine miles, crossed the Somme and ran as before from N. and S. to Maricourt, another 3,000 yards. Here the French front ended, and the line turned sharply and ran W. for 7,000 yards. Here it turned N. again, making a sharp salient at the village of Fricourt. Thence to the Ancre, approximately 10,000 yards, the line ran over several spurs which jut S.W. from the ridge which formed the backbone of the German position. This ridge runs roughly N.W. from Péronne, dividing the valley of the Somme from the basins of the Scarpe and Scheldt. After crossing the Ancre the German line continued in a generally N. direction in front of Beaumont-Hamel and Serre, this last village forming the N. end of the front to be attacked, though a couple of miles farther N. a subsidiary attack was to be made against the pronounced salient at Gommecourt. The total frontage was over 25 miles, exclusive of the Gommecourt operations.

Against this frontage the British had available the five army corps of Sir Henry Rawlinson's IV. Army, which put into the front line eleven divisions keeping another nine in reserve, while two divisions of the III. Army (Sir E. Allenby) were to be employed against Gommecourt. On the German side some six divisions were holding the line to be attacked by the British.

Opposite the French, where they do not appear to have been expecting an attack, they were proportionately weaker, having three divisions in the line on a front of eleven miles.

Relatively to the numbers engaged in the Loos offensive, the British army was not employing in its first attack any greatly increased force of infantry. Where its preparations had altogether outstripped those of Sept. 1915 was in artillery, and it was on this arm that its chief hopes rested. For the six days' preliminary bombardment the heavy guns available were so numerous that it was difficult to find good positions for them all. Indeed the artillery personnel engaged in the first attack came to nearly half that of the infantry, and in weight as well as in number of guns the Allied artillery were able to establish a predominance over the enemy. This was largely due to the success with which the Royal Flying Corps was at the time contending against the enemy's aircraft; the mastery of the air which it had established ensured to the Allies—when weather conditions permitted—observation of artillery fire and denied to the enemy this important advantage and the opportunity of gaining information of movements behind the lines. Ammunition, too, if not as unlimited as it was to be in 1918, was plentiful. The careful economy which had been a painful necessity during the winter and spring had allowed the accumulation of large reserves, and although the great development of munition-making in England, undertaken in the summer of 1915, was only just beginning to produce its effects, its influence was already apparent in the effective bombardment to which the German positions were subjected for the week preceding the attack.

In one way the bombardment was almost too effective. The destruction was in some places so complete that it proved far more difficult to consolidate captured positions and to hold them against counter-attacks than to carry them. But to a large extent the German defences proved capable of withstanding even the tremendous shelling to which they had been subjected. Many nests of machine-guns had escaped intact, in places there were still stretches of uncut wire and the German artillery were able to make a most effective reply. North of the Ancre in particular German counter-battery work had much to do with the failure of the 31st Div. (VIII. Corps), the left of the main attack, to capture Serre. On its right the 4th Div. penetrated some way into the German position N. of Beaumont-Hamel, but found its flanks exposed by the check to the 31st Div. and by the failure of the 20th Div. against Beaumont-Hamel itself, one of the very strongest parts of the German line. It was counter-attacked and driven out after a stubborn resistance.

Immediately S. of the Ancre the X. Corps fared little better than the VIII. Its left division, the 36th (Ulster) began well and pressed forward N. of Thiéval. But Thiéval itself, another formidable fortress, defied the attacks of the 49th and 32nd Divs., with the result that the very success of the 36th contributed to its undoing. Its advanced detachments were cut off and overwhelmed, and in the end it was forced to evacuate its captures. South of Thiéval, however, at the angle known as the Leipzig Salient a slender foothold was gained and maintained despite the vigour of the German counter-attacks. On the right of the X. Corps, the 8th and 34th Divs. of the III. Corps had two very difficult places to attack in the strongly fortified villages of Ovillers and La Boisselle. Neither of these was captured, but the III. Corps managed to penetrate the German lines on either side of them, very slightly N. of Ovillers, rather more deeply between that and La Boisselle, and very much deeper S. of La Boisselle. Here also the 21st Div. of the XV. Corps, flanked on its right by a brigade of the 17th Div., made substantial progress N. of Fricourt, which village was in danger of being cut off, as E. of it the 7th Div., also of the XV. Corps, was most successful, storming the German front lines and penetrating as far as the village of Mametz. To the right again the XIII. Corps (18th and 30th Divs.) made great progress, reaching all its objectives from Montauban, W. to Mametz and E. to the Briqueterie. Thus, despite the failure of the British left and the limited success of the centre, the right had made a promising opening.

The reverse on the left may be in part explained by the excep-

tional strength of the German defences N. of the Ancre, and by the concentration of the German artillery in that quarter where they both expected and especially feared an attack. Had Beaumont-Hamel and Thiéval gone the German position on the main ridge would have been more seriously endangered than it was by the British success between Fricourt and Montauban. But if the Germans were less well prepared for an attack on this frontage, opposite the French they were certainly neither expecting one nor ready for it; and this, together with the ample artillery support available and the superior experience of the French gunners, contributed to the complete success of General Foch's attack. On both banks of the Somme his infantry mastered the German front system and made their way deep into their positions, reaching the outskirts of Hardecourt and Curlu N. of the river, while S. of it they progressed even farther, taking Dompierre and Foy. Exploiting their victory, the French pressed on, and by July 4 not only penetrated into the second system of German defences, but captured it over a length of six miles from Estrées N. to the Somme at Buscourt. Some 6,000 prisoners fell into their hands, with many guns, and as S. of the river they were well forward of the line reached on the right bank they were able to enfilade the German positions from across the river.

While General Foch's troops were exploiting and increasing their gains the British IV. Army was similarly employed, though on a frontage shorter than that originally attacked. Recognizing the futility of renewing the attempt on the formidable positions astride the Ancre, Sir Douglas Haig decided to concentrate his efforts on pushing home the success of his right. Divisions which had lost particularly heavily, like the 8th and 36th, were withdrawn and replaced by others from the reserves. Four days of hard and continuous fighting substantially extended the lodgment gained on July 1. The 7th and 17th Divs. joined hands behind Fricourt, cutting off that village; then, supported by the 23rd, they pressed forward against Contalmaison while the 19th Div. on their left reduced La Boisselle and made headway towards Ovillers. Advancing from Montauban after repulsing several strong counter-attacks the XIII. Corps captured Caterpillar and Bernafay Woods. With this the hostile front system over a front of six miles was secured and consolidated, but before a footing could be gained on the main ridge it was necessary to cross the valley which runs N.E. from Fricourt, to gain more ground towards Contalmaison, and to reduce Ovillers.

On July 7 therefore a second stage of the first battle started, the 12th and 25th Divs. assailing Ovillers while the troops who had cleared Fricourt and La Boisselle pushed on against Contalmaison and the 38th (Welsh) Div. attacked Mametz Wood. This last proved difficult to reduce but was finally cleared by the 21st Division. By July 13 Contalmaison also had been taken, and after some desperate fighting by the 9th, 18th, and 30th Divs. important gains had been made on the British right, Trones Wood (which changed hands repeatedly) being the scene of the fiercest contests. Meanwhile the French had cleared Hardecourt and advanced their line S. of the Somme to Biaches.

During all this fighting the German resistance had been stiffening. The stubborn fights which had been put up for Ovillers and Contalmaison and Trones Wood had given time for the arrival of strong reinforcements and the reorganization of the defence. The divisions on whom had fallen the brunt of the bombardment and of the first attack had been relieved by fresher troops; artillery had been shifted to meet the requirements of the new situation. Moreover, as the Allies advanced over the area devastated by the bombardment their administrative difficulties increased at each step; the advance of the guns to new positions meant new arrangements for ammunition supply, roads had to be repaired or improvised, and the feeding and watering of the advanced troops were laborious and troublesome. All these circumstances added to the difficulties of the next step, the assault upon the enemy's second system of defences on the S. crest of the main ridge. This system, though hardly as strong as that stormed on July 1, was formidable enough, and, like it, was supported by the fortified villages Longueval, Bazentin le Grand, and Bazentin le Petit and by several woods. To get within assaulting distance

the troops had to advance under cover of darkness for about 1,000 to 1,400 yards in order to line up below the crest. This operation was a severe test for the troops; most of them had no experience of anything but trench warfare, but they acquitted themselves most creditably and the attack, launched just before dawn on July 14, met with great success. The 18th Div. finally cleared Trones Wood. Longueval and the two Bazentins were carried, the former by the 9th Div., the others by the 3rd and 7th Divs., while farther W. the 21st Div. cleared Bazentin le Petit Wood, and more ground was gained on that flank by the 1st and 34th Divs., though here the success was less complete.

For a time indeed even more substantial, almost decisive, results seemed within reach, for, after some counter-attacks on the British centre had been repulsed, it proved possible to push the 7th Div. forward to the top of the ridge to occupy High Wood. But the divisions on the flanks could not get up level with this, and though all the next day the detachment in High Wood held its ground, the position was untenable and had to be evacuated on the evening of July 15. The Germans, indeed, realizing the critical nature of the situation, spared no efforts to stop the further progress of the British and developed a series of counter-attacks against which the captured positions were only maintained with the greatest difficulty. Thus, though the attack had given the British the Bazentin Ridge on a front of 6,000 yards, and had incidentally led to the complete isolation and surrender (July 17) of Ovillers, which allowed a substantial advance to be made toward Pozières, it was followed by a phase of the battle in which the Allied progress was disappointingly small and seemingly out of all proportion to the efforts made and to the casualties incurred.

*Second Phase.*—The battles of July 1-12 and July 14-17 had left the Allies in a tactical situation not altogether advantageous. The check to the British left centre had left the Germans in possession of Thiépval which with Pozières about two miles S.E. of it presented serious obstacles to any progress towards the Ancre and threatened to enfilade any further advance straight to the front. Pozières must be mastered before the British centre could get forward. Even more important was it to improve the position round Longueval, where the advance of July 14 had created a sharp salient with its apex at Delville Wood, N.E. of the village. From this point the British line ran almost due S. to join the French at Maltzborn Farm S.E. of Trones Wood, being continued thence S.W. of Maurepas to the Somme at Ham. It was imperative that the British right and the French troops N. of the Somme should make a substantial advance in order to reduce the sharpness of the salient at Delville Wood, a point which was extremely difficult to maintain, being subjected to a concentric artillery fire from the N. and E. as well as repeatedly counter-attacked. The wood had been captured on July 15 by the S. African Brigade of the 9th Div., but had been promptly counter-attacked by the 10th Bavarian Div. and then by the 7th and 8th Divs., picked troops all of them, and its possession continued in dispute for weeks. Longueval in like manner changed hands several times, the 2nd, 3rd, 5th and 18th Divs. in addition to the 9th being at one time and another engaged in the struggle for these key positions, the scenes of fighting as desperate as any in the long struggle of "the Somme."

And when at last Delville Wood had been cleared the task of debouching from its ruins presented great difficulties. In Ginchy and Guillemont, E. and S.E. of it, the enemy had positions of great strength, the fortifications of which formed a formidable support to their second system of trenches which ran S.E. by Maurepas towards the Somme. Maurepas proved a similar stumbling-block to the French; they reached it on July 30, but not till Aug. 24 was it completely in their hands, and they had to pay heavily for it. And behind Maurepas lay Le Forest with Rancourt and Frégicourt yet farther back.

The last week of July and all Aug. passed without any advance like that of July 14. The Germans fought stubbornly and counter-attacked persistently and resolutely, while, as over-addiction to the use of the bomb had sadly reduced the standard of musketry of the British infantry, their counter-attacks escaped

the punishment they would have received in 1914. It was a time of constant and desperate fighting, of small advances, of many repulses and disappointments. Guillemont in particular was attacked on July 23 and July 30, on August 8 and August 16, but without more success than the capture and retention of the railway station on the outskirts of the village. But despite all these checks the line crept forward: to a considerable extent on the French front where, during Aug., it got within assaulting distance of Combles, Le Forest and Clerly, and nearly 3,000 prisoners were taken; to a smaller extent on the British right; to a rather larger extent in the British centre, where the 33rd Div. won a foothold in High Wood and the 5th and 7th gained ground between that point and Longueval, while W. of High Wood a series of minor operations gradually advanced the British line up the crest. Farther to the left again, there was hard fighting by the troops of the Reserve or V. Army. This had been formed after July 1 by putting Sir Hubert Gough in command of the left wing of the IV. Army, in order to allow Sir Henry Rawlinson to concentrate his attention on the attack to the E. of the Albert-Bapaume road. The capture of Pozières was urgent as an indispensable preliminary to any advance over the watershed, and when this was accomplished (July 25) by the 1st Australian Div., flanked by the 48th, an important gain had been secured. But the German resistance in this quarter was very determined, and though some progress was made towards Thiépval from the Leipzig salient on the S. and from Pozières, Mouquet Farm E. of Thiépval proved a stumbling-block. Bad weather, too, with much rain and frequent cloud which impeded aerial observation of artillery fire, hampered the attackers, and the Germans, now thoroughly alive to the importance of holding up this advance, brought up fresh divisions with great rapidity. By the end of August five times as many German divisions as had been in the line on July 1 had been located on the British front. However, by Ludendorff's own admission, the strain on the Germans was tremendous; the need for constantly relieving exhausted divisions taxed their resources in men, artillery was so short that batteries were constantly kept in the line when their relief was due, the ammunition supply was beginning to cause anxiety, and worst of all, the resistance of the German infantry was weakening under the pressure of the Allied infantry attacks and of the Allied superiority in artillery and aircraft. The supersession of General von Falkenhayn as chief of the general staff by Field-Marshal von Hindenburg, with Ludendorff as his chief assistant ("First Quartermaster-General"), which took place on Aug. 27, may be in part attributed to the effects of the Somme, and was promptly followed by "the momentous order for the cessation of the offensive at Verdun." Pressed as they were on the Somme the Germans could no longer continue attacking elsewhere. If the immediate Allied gains on the Somme seemed small their offensive there had already relieved Verdun.

With September the second phase of the struggle was reaching its final stage. This took the shape of a general attack, extending almost as far as that on July 1, even N. of the Ancre, where the V. Army once again assailed Beaumont-Hamel. Most success fell to the French, who not only attacked and took Le Forest and Clerly but attempted more S. of the Somme than on any occasion since the middle of July. Besides pressing on against the Berny-Vernandovillers line which they had then reached they extended their attack as far S. as Chaules, storming the old German front line on a front of three miles. Their success here, which brought over 7,000 prisoners with many guns, did not as immediately affect the fortunes of the main struggle as did the capture of Le Forest and Clerly, which was a considerable help to the British right as well as threatening Combles and the Péronne-Bapaume line, where the Germans were already busy on a rearward system of defences; still, it increased the area on which the Germans had to keep on the alert, and it was a great encouragement to the French, so lately strained to the utmost to retain Verdun, to be recovering more territory from the German grip.

To the British, Sept. 3 was a day of more qualified success. Once again the Beaumont-Hamel position proved impregnable, the efforts of the 49th Div. against Thiépval met with no success,

and though in the British centre between High Wood and Delville Wood ground was gained, German counter-attacks recovered most of it. But the right fared better. The 20th (Light) Div., assisted by a brigade of the 16th (Irish) Div., at last mastered Guillemont, the obstacle which had held up so many attacks and cost so many casualties. The 7th Div. reached Ginchy, but after desperate fighting was thrust out of it again, while on the extreme right three days of hard fighting gave the 5th Div. Fallemont Farm and brought it to Leuze Wood. Here, therefore, the original German second system, which had so long held back the British right, was at last pierced and when on Sept. 9 this success was followed up by the capture and retention of Ginchy by the 16th Div. and the advance of the 56th (London) Div. up to Bouleaux Wood, the great stumbling-block to the advance of the British centre was at last so far removed that it could now push forward without putting itself at a grave disadvantage from enfilade and reverse fire. Thus the battles for Guillemont and Ginchy (Sept. 3 and 9) mark a very definite stage in the Allied progress. The forward crest of the main ridge was in their hands over a front of five miles and more. It was now possible to plan a general advance against the villages on the northern slopes of the watershed. Such an attack, if successful, would bring the British up against the rearmost of the enemy's original systems of defence, and would make the position of the Germans on their old front line S. of the Ancre and immediately N. of it pronounced salient.

*Third Phase.*—The next attack, therefore, opened a new phase in the offensive. Special preparations were made for it, and a week's pause after the taking of Ginchy allowed of many reliefs. Thus the ten divisions of the IV. Army employed in the attack of Sept. 15 included several which had not yet taken part in the operations, among them the Guards, the 6th, one of the original units of the 1914 "B.E.F." and the New Zealand. Similarly in the V. Army the Canadian Corps had replaced the Australians, who had since their capture of Pozieres made considerable gains N. of the Albert-Bapaume road. In addition to these fresh troops it had been decided to employ in this attack a new weapon from which much was expected. Despite the great increase in the available artillery and ammunition and the great improvements in the methods for directing, controlling and observing artillery fire, barbed wire and machine-guns were still the chief assets of the defence and had held up attack after attack. The evolution of the "tank" had been a long process. The idea of an armoured motor-car capable of defying both machine-guns and barbed wire had occurred to many people from the earliest days of the deadlock set up by the extension of the trench line from Switzerland to the North Sea. To translate this idea into practical shape, to produce a machine capable of accomplishing what was wanted, had been the work of months of ingenuity, experiment, devotion and skill. Not the least remarkable feature had been the success with which secrecy had been maintained. The tanks at their first venture hardly fulfilled their designers' hopes and expectations—it would have been extraordinary if they had—but they did quite well enough to encourage the Allies and to shake the *moral* of the German infantry, to whom they came as an effective surprise.

The frontage included in the British attack stretched from just S. of Courcellette to just W. of Combles. That strongly fortified position itself was not to be attacked, as the capture of the high ground on either side of the valley would determine its fate, and S.E. of the valley the French, who had already on Sept. 12-13 attacked and taken Bouchavesnes with 2,000 prisoners, were ready to coöperate.

The attack proved a great if not a complete success. On the left the Canadians not only captured their objectives S. of Courcellette but exploited their success so well that the village itself, not part of the original objective, was carried and consolidated. To their right the 15th (Scottish) Div. captured Martinpuich, High Wood was at last completely cleared by the 47th Div. and farther to the right again the New Zealand and 41st Div., with some assistance from tanks, captured Flers and pushed some way beyond it. On the right the success was

less pronounced. A strong work between Ginchy and Morval known as the Quadrilateral held up the 6th Division. The tanks detailed to attack this point broke down and the gallant efforts of the infantry were unavailing. This check prevented the Guards Div. reaching their final objective, Lesbocufs, though they stormed their first and second objectives on the ridge S.W. of that village and maintained their position against counter-attacks. But with Lesbocufs and Morval, the objective of the 6th Div., still in German hands, the centre of the attack could not push forward without creating the same sort of situation as had prevailed on the right after the attack of July 14, and any further exploitation of the success was out of the question. Still, a big success had been achieved, a strong position had been broken into on a six-mile front, 4,000 prisoners had been taken, and the troops had the encouragement of having crossed the ridge and being able to see what lay on the farther side of the crest it had cost so much to gain.

The days that followed had to be occupied in reducing the Quadrilateral and in straightening out the line between Martinpuich and Flers. The 6th Div., not to be denied, pressed hard upon the Quadrilateral and after another unsuccessful attempt captured it on Sept. 18. But it is significant of the intensity and costliness of this fighting that the Quadrilateral had cost the 6th Division over 3,500 casualties. Its capture, however, allowed the line to be pushed forward within 1,000 yards of Morval and Lesbocufs, against which a new attack was in preparation.

Bad weather, however, delayed the delivery of this attack until Sept. 25. On this day the frontage attacked started at the Albert-Bapaume road but reached as far as the Somme. The French had, since capturing Bouchavesnes, improved their position S. of the Somme considerably by completing the reduction of Vermandouvillers, Berny and Denicourt, and they had on Sept. 20 successfully repulsed a strongly pressed counter-attack, N. of the Somme. Their objectives on this occasion included Rancourt and Frégicourt, Combles being dealt with indirectly by the capture of the heights on either side of it.

The "battle of Morval"—the official title for the attack of Sept. 25—was one of the most successful of the separate incidents of the Somme offensive. Except in the British centre at Gudecourt all the objectives were reached and carried before night-fall. On the left the 50th, 1st, New Zealand and 55th Divs. carried the line forward down the slopes N. of Flers and Martinpuich clearing two lines of trenches; on the right the Guards and 6th Divs. carried Lesbocufs and the 5th Div. took Morval, while Gudecourt also was captured next day (Sept. 26) by the 21st Div. assisted by a tank. The French were equally successful, and early on Sept. 26 British and French met in Combles, which was found full of stores and of German dead and wounded, the garrison having withdrawn just in time. Over 1,500 prisoners were captured by the British and nearly as many by the French, while signs were not wanting that the Germans were no longer putting up the stout resistance they had offered in the long struggles round Delville Wood and Guillemont. At several points large numbers of Germans surrendered or evacuated their positions almost without fighting. The strain of the continual bombardments and of the steady advance of the Allies was beginning to make itself felt.

The substantial success of Sept. 25 on the Allied right and centre was promptly followed up by victory in another quarter. Since July 1 there had been only one serious effort to renew the direct attack on the British left and the attempt of Sept. 3 had been a failure. Thiépval and all N. of it remained untaken. What progress had been made in this quarter had been from the S. and E. and it had not been rapid. The first real gain had not been made till the last half of Aug. when the scanty foothold already secured in the Leipzig salient directly S. of Thiépval had been enlarged by the 48th Div. This had been followed up by the capture (Aug. 24) by the 25th Div. of a trench known as the "Hindenburg trench." A violent counter-attack by a Prussian Guard Div. was successfully beaten off and minor gains had followed. Finally, on Sept. 14, a formidable redoubt known as the "Wonderwork," and situated just S. of Thiépval, was

stormed by the 11th Division. Meanwhile the progress of the Australians beyond and W. of Pozzières had greatly increased the prospects of success in attacking Thiépval.

From Thiépval a trench ran E. towards Courcellette known as the Zollern trench, halfway along which and N. of Mouquet Farm was the Zollern redoubt. North of Thiépval was the strongly fortified Schwaben redoubt from which the Stuff trench ran E. to the Stuff redoubt S. of Grandcourt, being continued beyond the Stuff redoubt as Regina trench. The capture of this second line would allow the British to overlook the Ancre valley and would make the position of the Germans N. of the Ancre most precarious. It was natural, therefore, that the Germans should cling with great pertinacity to the Thiépval position, but despite a stubborn resistance the V. Army's attack (Sept. 26) achieved a conspicuous success. The Canadian Corps on the right carried their objectives and brought their line within striking distance of Regina trench. The 11th Div. stormed the Zollern redoubt, the 18th on the left had the satisfaction of capturing Thiépval itself with over 1,000 prisoners from a Württemberg regiment, which had held that stronghold for nearly two years and believed it impregnable. These successes were promptly exploited and the capture of the Stuff redoubt by the 11th Div. and of part of the Schwaben redoubt by the 18th (Sept. 27-28) left the Germans with only a scanty foothold on the main ridge.

Simultaneously with the success at Thiépval, lesser but useful gains had been made by the IV. Army, including the capture of Destremont Farm, S. of Le Sars (Sept. 26). This was followed up by the taking after a stubborn fight of Eaucourt l'Abbaye (Oct. 3), though a gallant effort by the Canadians against Regina trench (Oct. 1) proved unsuccessful.

*Fourth Phase.*—It was at this moment, when the enemy's fourth system of defences had been reached and the Allies seemed about to accomplish a break-through (for the new lines on which he was at work still farther to the rear were not to be compared in strength or completeness with those already overcome), that a long spell of bad weather set in. Nothing could have been more unlucky for the Allies. As has been said, the German infantry were no longer fighting with their old resolution, their counter-attacks were not pressed with the old devotion and determination. But the constant rain and the cloudy days, which formed almost the only intervals in the rain, prevented adequate observation of artillery fire and turned the already damaged battle area into an impassable quagmire. The troops already engaged in the Somme offensive had had ample experience of hardships and difficulties; those encountered in Oct. and Nov. altogether surpassed what had gone before. The state of the ground was appalling: it had become a sea of mud, through which even lightly equipped runners found movement almost impossible, much more men laden with rifle, equipment and ammunition. In these conditions an ordinary trench relief was an achievement, to attack across such ground a hopeless undertaking. It is easy now to argue that the attempt to continue the attack in such adverse circumstances was a mistake, and could achieve nothing commensurate with the casualties and sufferings which it entailed. But it must not be forgotten that to suspend the offensive meant relaxing the pressure on the Germans, on whom the strain of fighting under these conditions was scarcely less severe and meant also giving them time to convert their incomplete new lines into defences scarcely less formidable than those the Allies had so painfully slowly pierced. At the beginning of Oct. the Germans had been pressed back to their last really strong positions, and behind the line that ran from Sailly-Saillisel past Le Transloy and in front of Bapaume they had not had time to develop anything elaborate or formidable. The anxiety of the higher command to pierce the Le Transloy line without delay was natural enough.

The situation after the capture of Thiépval was that on the British left the Germans retained a precarious footing on the heights above St. Pierre Divion and Grandcourt, but that any substantial advance by the British centre, now almost down into the Ancre valley N. of Martinpuich and Guedecourt, would

turn the German positions lower down the Ancre. As before, however, the centre could not push on far with safety unless the right came forward level with it, and it was in front of the right that the German positions were most formidable. Their Sailly-Saillisel-Le Transloy line, itself strong, was covered by a long spur running in a N.W. direction and separating Lesbocufs and Guedecourt from Le Transloy and Beaulencourt. To capture this spur was indispensable before the Le Transloy line could be attacked. But a successful attack on the Le Transloy line was needed to open to the Allies the opportunity for an advance on a wide front in a N. and N.E. direction. Such a stroke would not merely outflank the Beaumont-Hamel position but the whole German position from Arras to the Ancre would be taken in rear. A dry Oct. might well have seen this hope realized and in Oct. 1916 there was no "Hindenburg Line" to bring an Allied advance to a standstill.

But with the weather as it was Oct. was a month of disappointment and scanty progress. The fighting was constant and costly. Trenches were difficult to take but much more difficult to consolidate or defend. The operations may be divided into three groups; on the right the French attacked and took Sailly-Saillisel but could make little progress N. and E. of it. In this quarter the repeated British efforts against the spur in front of Le Transloy resulted in the establishment of their line on its crest of the spur. In the centre, after the capture of Eaucourt l'Abbaye (Oct. 3) the chief gain was that the 23rd Div. secured Le Sars on Oct. 7. But to the N.E. of Le Sars the Allied progress was arrested by the gentle rise on which stands the mound known as the Butte de Warlencourt. This position was not particularly formidable in itself and in dry weather would not have held up the advance for long, but between the difficulty of accurately observing the fire of the supporting artillery and that of moving up the muddy slope on which the Butte stood attack after attack failed. The 47th Div. on Oct. 7, the 6th and 13th on Oct. 12, the 50th on Oct. 25 all found the Butte impregnable, though between Oct. 18 and 20 the 9th Div. did secure an advanced position in Snag trench, halfway up the slope, after a savage struggle.

The failure to take the Butte de Warlencourt or to make any substantial progress farther to the E. was to some degree compensated for on the left. Despite more than one repulse the line of Regina trench from the Courcellette-Pys road W. was stormed on Oct. 21 by the 15th, 18th, 30th and 4th Canadian Divs., and on Nov. 10 the Canadians extended their success by capturing the E. part of the trench on a front of half a mile.

By this time a sufficient improvement had taken place in the weather to allow of an operation on a larger scale than anything attempted since the battles of Morval and Thiépval. The more ambitious schemes for an advance across the Upper Ancre could not be put into force, but the German hold on the Beaumont-Hamel position had been weakened by the capture of Thiépval and it was decided to renew the attack in this quarter, the only portion of the frontage originally attacked which was still in German hands.

After a bombardment covering two days, the attack was delivered about an hour before daybreak on Nov. 13. South of the Ancre the 19th Div. cleared the German trenches N. of the Schwaben and Stuff redoubts and the 30th Div. took its farthest objective at St. Pierre Divion with remarkable ease and rapidity. North of the river the 63rd (Royal Naval) Div. fought its way forward to Beaucourt sur Ancre and held on tenaciously though in advance of the troops on its left. These, the 51st (Highland) Div., had been stoutly opposed at Beaumont-Hamel but had finally mastered the village, N. of which the 2nd Div. had carried the right portion of its objective. On the left, however, where the ground was specially heavy, the 3rd and 31st Divs. had been less successful; Serre had once again proved impregnable. But on the following day the success was exploited, Beaucourt was captured and the 51st and 2nd Divs. pushing forward along the spur N. and E. of Beaumont-Hamel established themselves on a line which secured Beaucourt on the N. and W. With this important gain of ground over 7,000

prisoners were taken, and to the Germans the quite unexpected loss of the long impregnable Beaumont-Hamel "was a particularly heavy blow" (Ludendorff). Advantage was taken of this victory to deliver a successful attack on a front of three miles against the German trenches on the slopes above Pys and Grandcourt (Nov. 18), but then the return of bad weather finally stopped the prosecution of active operations.

*General Aspects.*—The Allied offensive on the Somme had not yielded all the results that had been hoped for or that had at times seemed within reach. It was only natural that in some quarters the heavy cost at which the watershed between the Somme and Ancre had been mastered should be looked upon as altogether disproportionate to the gains, and that those who had not studied war sufficiently to realize that decisive victory is not to be had without a heavy price, and that it is not in achieving but in exploiting victory that the more tangible and spectacular gains are reaped, should be so disappointed as to overlook the substantial results which had been achieved. The Allies had begun the offensive with three main objects: to relieve the pressure on Verdun, to pin the enemy's main forces down to the western front, and, lastly, to wear down his powers of resistance. All these had been achieved, and of the three, the last, if the least tangible, was far from the least important. The 40,000 prisoners taken by the British and the 30,000 taken by the French might seem trifling in comparison with the vast captures made by both sides on the eastern front, but in quality the Germans taken on the Somme were very different from the half-armed Russians and the unenthusiastic mixture of nationalities who formed the Austro-Hungarian armies; and the decline of the German *moral*, admitted as it is by Ludendorff, outweighed in importance their losses in prisoners or material, considerable as these latter were. An eye-witness of the battle of Malplaquet wrote of that action, "the enemy was so advantageously posted that when the battle was over we wondered how we had surmounted the difficulties." Those who had been through the Somme might well have echoed his words, and despite the punishment they had received and the hardships they had endured the British and French had ample reason to be encouraged by their achievements. If the flower of the "new armies" of Great Britain and her Dominions overseas had been expended on the Somme, the Allies ended the year 1916 with a moral ascendancy over their enemies and with well justified hopes. It is only necessary to compare the strategical situation of Dec. 1916 with that of July 1 to see what a change had come over the war. On July 1 the Germans were certainly not contemplating attempting to negotiate a peace through the good offices of a neutral. And where had the change been brought about? Not on the eastern front, where Rumania had collapsed and the Russian offensive come to a standstill; not in Macedonia, where the capture of Monastir had been powerless to assist Rumania; not in the more distant theatres of war, where Kut was still in Turkish hands and the British had not yet reached the eastern frontier of Egypt; not in Italy, where the Austro-Hungarians were still holding up the Italian offensive across the Isonzo. Bad weather had prevented the immediate exploitation of the success earned in the struggles of July, Aug. and Sept.; changes of command and of plan were to throw away much of what the Allies had in their grasp early in 1917, but the change in the situation was the work of the Allied forces on the Somme. (C. T. A.)

## II. GERMAN OFFENSIVE OF MARCH–APRIL 1918

As soon as the general military situation towards the end of 1917 seemed to offer the Germans a possibility of conducting the war in the western theatre by means of attack, preparations for this were set on foot by the Supreme Command. The first German move was to fetch up all the troops from elsewhere that could be spared and establish—at least temporarily, until the strong American reinforcements were added to the Allies—a balance of forces in the western theatre of war, or, if possible, a preponderance on the German side. This would obtain the necessary time for rest and training. To this end German division

after division, and battery after battery, had been rolling up since the end of 1917 from Italy and the East into France. A number of heavy Austro-Hungarian batteries were also brought up. Finally 62 divisions and 1,706 batteries were made available for the main attack. For a second simultaneous attack in a different place these forces were not enough.

Systematic training for the attack was begun simultaneously behind the whole German front. Side by side with following out the instructions issued by the Supreme Command, the whole body of men had to be brought to exchange the defensive idea with which they had been living for the idea of the attack. The troops had to be taught the full use of machine-gun fire, guns and *minenwerfer*, and the support which airmen could give to infantry. They had to be trained to the utmost mobility and uplifted morally. The idea of surprise, which offered the only chance of the successful execution of a break-through operation, had also to be worked out in tactics.

Hand in hand with the equipping of the division chosen for the attack with horses and utensils of every kind went the collecting of munitions, supplies, building and sanitary materials, as well as the erection of railways, roads and battery positions.

Only a limited number of divisions could be equipped for the attack owing to the shortage of draft and horses. The building preparations were extended along the whole of the W. front so as to veil tactical purposes as long as possible.

At the end of Dec. 1917 the German Supreme Command had arranged for the mounting of quite a number of attacks. Although it was admitted that, for want of forces, the whole Allied front could not be attacked at once in order to find the suitable point for a break-through according to the Schlieffen idea, it was intended to keep the enemy as long as possible in ignorance of the German Supreme Command's actual intentions.

The decision as to which attack should actually be carried out was arrived at from a tactical point of view, strategical considerations being put aside. "Tactics had to be considered before purely strategical objects," writes Ludendorff, "which it is futile to pursue unless tactical success is possible. A strategical plan which ignores the tactical factor is fore-doomed to failure." Starting from this point of view Ludendorff decided to carry out the so-called "Michael" attack against the projecting southern sector of the British front. The attack was aimed at the British only, because they were still exhausted from the fighting of 1917 and it was desirable on general grounds to beat them first. It was to be executed at an early date independently of weather conditions. The sector to be attacked was thinly held and insufficiently fortified. It therefore seemed probable that the attack would succeed and that strategical use could be made of the break-through. It was unavoidable that the attack should take its course over the ground destroyed in the "Siegfried" retreat and the battle of the Somme.

The plans for the great attack were issued by the Supreme Command on Jan. 24 1918. The following individual attacks were to be prepared:—"Mars" (left wing) and "Michael I.," towards the N.E. past Bapaume; by the XVII. Army; "Michael II.," to the N. of the Omignon brook, by the II. Army; "Michael III.," on both sides of St. Quentin, by the XVIII. Army; "Archangel," south of the Oise, by the VII. Army. The "Michael" attack was proposed for March 20. The "Mars" and "Archangel" attacks were to follow a few days later, after the regrouping of the "Michael" artillery. The main attack was to break through the enemy front, and then, in conjunction with "Mars" left wing, to push on through Péronne-Arras. The XVIII. Army was to reach the line La Fère-Péronne. The "Archangel" attack was conceived merely as a diversion. The preparation of the attacks on Ypres-La Bassée (George I. and II.) was to be continued, the Hector-Achilles operations in the Argonne and Champagne were to be kept simmering. In case the Michael attack stopped short there was to be an attack by the III. Army. Instructions for demonstration actions were kept in reserve.

Rupprecht's group of armies, which, according to this plan, were to carry out the main assault with the XVII. and II.

Armies, were instructed to aim first and foremost at cutting off the British in the Cambrai bend. The armies were to advance with strong inner wings, the XVII. on Ypres and the II. on Equancourt. Subsequently the XVII. army was to deliver an assault in the direction of Arras-Albert and gradually roll up the adjacent British front, the II. Army to push forward in a westerly direction with the left wing on the Somme.

In the German Crown Prince's group of armies the XVIII. Army had to conquer the Somme and the Crozat Canal and eventually to extend to Péronne. If the II. Army should encounter any considerable resistance the XVIII. Army was to advance strong forces through Beauvois-Tertry to cut off the opponent in front of the II. Army. The Mars attack S. of the Scarpe was to follow the Michael attack as soon as possible and amplify the Michael operation. Farther N. preparations were also made to profit by it (Mars, N. Walkürenritt).

The forces provided for the break-through were 15 attack divisions and 2 position divisions for the XVII. Army, 15 attack divisions and 3 of position for the II. Army, and 19 attack divisions and 5 of position for the XVIII. Army. Besides these, 3 divisions were retained by the Supreme Command for disposal, first at Bouchain, then at Denain. As regards artillery, 950 field batteries, 701 heavy and 55 heaviest batteries were called up. Added to these were a few Austro-Hungarian heavy batteries, inadequately supplied with munitions.

In the prolonged preparations now carefully made, the attack front was kept as lifeless as possible, with the troops unchanged and the day-traffic kept down. Detrainments went on a long way to the rear on a wide front, and all movements of importance were held over until night time.

In March, each of the four groups of armies executed a first attack. In the Crown Prince Rupprecht's group the preparations were so elaborate in the region of Ypres and Armentières that even the troops themselves and their leaders were convinced that a great attack was really imminent. The German Crown Prince's group made a show of preparing an attack in the neighbourhood of Reims. From the 14th onwards reconnaissance attacks, bombardment of the enemy headquarters, bombing by airmen and the bringing up of reinforcements, set in. The increased artillery activity continued until March 24. Gallwitz's group of armies carried out a great attack on Verdun systematically up to the stage when the infantry should have come in, with several days of artillery preparation, a gas attack, and the bombardment of railway stations behind the lines. Duke Albrecht's group feigned an attack on the Lorraine front, and carried out a heavy artillery battle from March 20 to 24.

The result of these German operations was to intensify the opponents' suspense to the utmost. The British put themselves in a position of defence against a great attack between Armentières and La Bassée and between Arras and St. Quentin, and shifted forces from Flanders to the south. The French evidently expected an attack at Reims. New defensive works arose everywhere in the chief opponents' lines. They reinforced their batteries and sought by increased activity on the part of the airmen and patrols, to penetrate the obscurity which enveloped the German mode of procedure.

In the front of the actual attack the Germans counted upon having, in front of the XVII. Army, 15 strong British divisions of the III. Army (General Byng), and in front of both armies 23 divisions of the V. Army (General Gough). The Germans assumed, further, that the leader of the combined operations of the Entente, General Foch, would have in readiness strong reserves, mainly French, somewhere in the region of Meaux behind the centre of the enemy front. The majority of the British reserves were supposed to be behind the centre of the British front. No signs of withdrawing were seen on the enemy's part. A restricted foreground was counted upon.

The actual forming up for deployment of the attacking armies began on March 10 with the munitioning. The artillery deployment followed, and the attack divisions next moved into their positions at the front. Everything passed off smoothly and without any great counter-measures being taken by the defence.

All the difficulties due to compressing within a narrow space great masses of human beings and piles of utensils and contrivances were easily overcome. The divisions were organized in groups, usually three lines deep, the first line being made the strongest in order to ensure rapid results at the beginning. The first line advanced close up to the front trenches on March 20, the second standing at a distance of 3-5 km. and the third 7-10 km. behind. The hindermost lines were looked upon as reserves for the higher command. They were not simply to follow up the others but to be fetched up according to the needs of the tactical situation.

The Supreme Command held in readiness, besides the above mentioned three divisions at Denain, other reserves behind the remaining army fronts, and reserved to itself the right of withdrawing forces from the front line when necessary.

On March 20 the attack divisions, protected by aircraft, were drawn up behind the position from which the assault was to be made. The deployment of the artillery and *minenwerfer* was complete and the munitions in readiness. Only the order to advance had still to come. But here the weather threatened to upset all plans, for the direction of the wind was such as would spoil the effect of the artillery's gas, and the fog would make the attack movement difficult for the infantry. By 12 at midday the weather conditions had so far improved, however, that it was decided to carry out the attack on March 21. On that day, accordingly, at 3:30 A.M., the gassing of the Allied batteries began. This was followed by a 3-hours' preliminary bombardment of the British positions by the German artillery and *minenwerfer*. At 9:40 A.M. the German infantry dashed forward to the attack. The mass of artillery then made a barrage, which, creeping gradually forward, was to pave a way for the infantry into the depths of the opposing trench system.

The attack itself turned out very differently at different points. In the XVII. Army, commanded by Otto von Below, the coöperation of infantry and artillery was not without its hitches. The barrage "ran away from the storming infantry," who only reached the opponent's first position and found itself in the evening before the strongly occupied second position. At Vaulx Vrancourt and to the N. of it, as also at Doignies, the British put up strong counter-attacks, to repel which several and line German divisions had to be put in. The British defended themselves here with great stubbornness against the obvious danger of being shut off on the Cambrai bend.

The II. Army, commanded by von der Marwitz, pushed through to the line Gonzeaucourt-E. of Epéhy-Templeux le Guérard-Le Verguier. Their main battle raged around the high-perched village of Epéhy, which the XXIII. Reserve Corps failed to take in spite of heroic efforts. With this army only a small portion of the second line divisions needed to be brought up. There were no serious counter-attacks.

The greatest success was achieved by the XVIII. Army, commanded by von Hutier. Its right wing pushed through the second British position and took the Holnon Wood. The centre got through beyond Savy, Dallon, Fontaine les Clercs, and the left wing took Urville, Esigny le Grand and Beney, and forced the Oise crossing. The XVIII. Army also took the most booty.

On the whole a great initial success had been achieved. Everything depended upon whether it could be successfully developed.

The German Supreme Command was determined to order the continuation of the attack according to the results of the first day's fighting. It allotted the first reinforcements brought up to the XVIII. Army and the left wing of the II. Army, directing the XVIII. to ease the advance of the II. by pushing forward on Tertry. The II. Army was likewise to put its weight upon the left wing. On the second day the fighting was heavy, the chief burden falling on the infantry. A systematic preliminary bombardment was impracticable on account of the progress made on the first day, and it was a difficult matter to pull the batteries through the obstacles and shelled areas. The heaviest and most thankless task was once more allotted to the XVII. Army. Its infantry penetrated the second British positions time after time, only to be forced back just as often by strong count-

er-attacks assisted by tanks. Not until the afternoon did they succeed, with considerable losses, in taking Croisilles, Vaulx Vrancourt and Morchies, and entering Hermies. To do this they had to be assisted by large portions of the third line. In the evening the army found itself once more up against another strongly held British position on the line Béhagnies, Beugnâtre-Begnuy.

The II. Army had also had more hard battles to win. It took Epéhy and pushed forward as far as Fins-Longavesnes-Marquais-Coulaincourt, capturing considerable booty. It was not able to interfere with the British evacuation of the Cambrai bend, owing to the slow progress made by the XVII. Army.

The XVIII. Army made a good advance encountering only slight resistance. It stormed Feuguères and forced a crossing over the Crozat Canal between Jussy and Tergnier. For March 23 General Ludendorff ordered an attack by the XVII. Army in the direction of Bapaume, to supplement the success of the II. Army, and an advance on both sides of the Somme by the II. and XVIII. Armies.

This day at last brought the reward of their heavy labour. The XVII. Army met with sharp opposition even now from newly put in divisions, but was able to take Monchy, Dricourt, St. Leger, Beaumetz, Lebucquière and Havrincourt.

The II. Army encountered heavy resistance on the right wing only, and was able to reach the line Neuville-Etricourt-E. of Bouchavesnes-E. of Péronne—the Somme at Brie, with only slight opposition. The XVIII. Army took the Somme crossing at Béthencourt by fighting, stormed Ham and crossed the Crozat Canal. Its left wing corps (the IV. Reserve) repelled the counter-attacks of 3 French divisions that were being hurried up as reinforcements in a bloody battle.

For the next two days the scene remained unchanged. The XVII. and II. Armies advanced towards the Ancre, fighting violently, the II. being more and more hindered by the shelled area of the Somme battle. But gradually a new front arose on the Ancre in front of these armies, stretching southward to the Somme. In the region of Albert the British executed one counter-attack after another, though with heavy losses.

The centre and right wing of the II. Army had, by March 26, reached Thiépval, Beaumont-Hamel, Mametz, Cornoy, Albert and Braye sur Somme. Certain portions veering in from the N. opened a way of advance for the lagging left wing, which was thus able to come up with the rest of the army on March 27 on arriving at Ville sur Ancre-Sailly. Meanwhile the resistance was visibly growing, and it was possible to calculate the point at which it would be equal to the decreasing pressure of the attacking forces.

The XVII. Army had been steadily fighting its way forwards through village after village. In proportion as the opponent's fighting power waned new forces were put in. He seemed determined that there should be no question of rolling up or breaking through his front at Arras under any circumstances. In spite of this the army managed to take Bapaume on March 24, Béhagnies, Sapignies, Grévilleurs and Ires on the 25th, and to reach Boiry, Becquerelle, Hamelincourt, Achiet le Grand and Achiet le Petit on the 26th. The attacking power of the army was now exhausted. On the 27th it did no more than capture the village of Ablainzeville and repel the counter-attacks of new British forces with powerful artillery.

The II. Army progressed in much the same way. The XVIII. Army maintained its almost unbroken advance throughout the days from March 23 to 27. By the evening of the 25th it had reached Nyencourt, Curchy, Nesle, Hattencourt-Beaulieu-Bussy, and on the 27th was in possession of Pierrepont, Montdidier, Boulogne la Grosse and Lassigny.

At this point the great battle came temporarily to a close. General Ludendorff had, on the evening of March 26, shaped his plans with the view of dividing the British and French by a gradual left-wheel advance of the II. and XVIII. Armies against the French. To this end the Somme at Amiens, and the Avre had to be reached, and the operation continued towards the S.W. The original plans had thus undergone a complete change

in the course of its execution. It would now very soon be shown whether the tactical break-through could still be brought off in spite of the waning of the Germans' strength and the increase of the Allied resistance.

The course of events on March 27 did not come up to Ludendorff's arrogant expectations. It was impossible for the attacking force to know that in the direction of Amiens—the decisive point—the Allies had only very weak forces at their disposal on that day. In this case, as in every break-through, the difficulty of accurately estimating the exact effect presented itself. The difficulties of provisioning, too, made themselves increasingly felt in the shelled area of the Somme battlefield. The supply of munitions ceased, and the establishment of rearward communications had not kept pace with the advance of the attack. From certain signs it was evident that the German troops were not everywhere at their highest level of achievement and endurance. The losses, particularly those of the XVII. Army, exceeded what under the circumstances was the legitimate number.

Ludendorff therefore changed his intention once more on March 27. The XVII. Army was ordered to close down the attack. The XVIII. and the left wing of the II. were to renew their attack on the now isolated French on March 30 between the Somme and the Oise. This attack resulted in the filling out of the German line where it curved in S. of the Somme, and the taking of the localities Aubercourt, Démuin, Moreuil, Sauvillers, Hargicourt, Contigny, Anainvillers, and Rollet—the so-called bridgehead of the Avre. But while the break-through at Amiens failed, the Germans were able to repulse the violent, though disconnected, French counter-attacks in every case. By April 4 the right wing of the XVIII. Army had still been able to take the heights W. of Moreuil. The II. Army reached the western border of Hamel and pushed forward almost to Villers Bretonneux and Hangard. The battle then ceased.

Later repetitions of the attack in the direction of Amiens had no better results. An assault on April 24 by the II. Army in the neighbourhood of Villers Bretonneux, in which tanks were used, made good progress at first but could not hold the ground gained. The battle ended therefore without any clear decision. Certainly the Germans had achieved an initial success such as had been denied to the Entente during the preceding 3½ years of hard struggle in spite of the masses of men and material put in; they had more than made good the ground lost in 1916, and had captured—apart from enormous booty—90,000 prisoners and 1,200 guns. The British army was heavily shaken; 20 French divisions had been drawn into the battle; but the war had not been won, and neither the transition to a war of movement, nor the separation of the French and British had been achieved. In the course of the battle 90 German divisions—almost half of the western army—had suffered more or less heavy losses. New and great efforts would be required for the fulfilment of Ludendorff's great aim.

*Battles of Arras and the Oise.*—An attempt was next made to extend the front of the attack on both sides. To this end Rupprecht's group of armies had been preparing since March 22 to carry out the Mars N. attack at an early date, and had allotted to the XVII. Army three divisions standing behind the VI. Army in view of this. To replace them four divisions of the IV. Army were sent to the VI. The group of armies hoped at last to break the British lines by delivering two attacks on their front—this one and the Walkürenritt by the VI. Army—while the II. and XVIII. Armies profited by their early success on the British right wing. But this plan had for the moment to be pushed aside as the Supreme Command placed all the pressure on the left wing of the Michael operation. Not until March 25 did Ludendorff revert to the extension of the attack on the British. He settled that the Mars attack should take place between the Loretto height and the Scarpe on March 28, together with a secondary attack south of that stream. The Walkürenritt attack on the Loretto height was to follow closely.

For this attack 7 German divisions were placed N. of the Scarpe, under the general command of the I. Bavarian Reserve Corps, and 4 S. of it under the general command of the III.

Bavarian and IX. Reserve Corps. But no success was obtained, although the divisions were mainly fresh ones. The work of attacking was hampered by the indistinct nature of the country and the endless maze of trenches. The British opposed the attack with fresh forces, and, particularly by the skillful use of their machine-guns, impeded the advance of the attacking force. North of the Scarpe the 1st line divisions, after some insignificant successes at the start, met with strong British counter-attacks, which threw back the attackers for the most part to their starting positions. Only the two localities, Gravelle and Roeux, remained in German hands. The Command did not put in any reserves.

South of the stream the localities of Neuville and Ayette yielded to the bold assaults of the German divisions fighting in that quarter, but no decisive success was attained. The taking of several thousand prisoners, and heavy losses on the Allied side, were the only positive results of the Mars attack, which had failed for two reasons—it was obviously on too narrow a front and had not been launched as a surprise.

The Supreme Command now gave up the VI. Army attack on the Loretto height, and ordered the XVII. Army, including its right wing, to stand on the defensive.

The extension of the attack S. of the Oise had no such wide operative aims. It was designed in the first place to protect the projecting left flank of the XVIII. Army and the road running behind it through La Fère-Chauny-Nayn, which was indispensable for bringing up drafts. To ensure this the Ailette line, which cut off the reëntering angle between the XVIII. and VII. Armies, had to be won. The task was entrusted to the general commands of the VIII. Army Corps and the VIII. Reserve Corps under the leading of the 7th Higher Army Command. The attack was led from the N.E. in view of the difficult Oise crossing. The attacking force, on April 6, took the French—who were apparently in no great strength—obviously by surprise, and pushed through South Chauny and Amigny to Marizelle and Barisis railway station. On April 7, after a short preliminary bombardment, the attack was continued, and Pierremande and the Coucy Wood were reached with only slight opposition. On the 8th the VIII. Army Corps advanced to the Ailette, S. of Le Bac d'Arblincourt, and stormed Champs. The VIII. Reserve Corps captured Coucy le Château, and reached the road Coucy-Landricourt-Arziy at nightfall. Finally on the 9th the two corps won the Oise-Aisne Canal along the whole front.

In a 4-days' struggle the problem had been smoothly solved. The victors held 2,300 prisoners. The front had been considerably shortened, and the possibility of successful attacks even against French defenders had been established. (W. M.-Lo.)

### III. THE BATTLE OF AMIENS, AUG. 8-22 1918

At the beginning of the fourth week in July, the German offensive on the Marne and in Champagne, which had been intended by their Higher Command as decisive, had been brilliantly repulsed by an Allied counter-blow, which had not only thrown back the enemy over the Marne but was forcing him back to the Vesle. Gen. Foch was resolved to follow up the advantage thus gained and assume the offensive on all his front as soon as possible; but it was essential before so doing to clear the main railway lines running laterally behind his front, several of which were menaced or blocked by the enemy. The most important of these was the Paris-Amiens line, and it was therefore decided that the first measure should be the freeing of this railway by a joint Franco-British attack on a wide front E. of Amiens. This operation was discussed first at a council of the four Allied commanders-in-chief, held at Bombon, near Melun, on July 24 1918 and further in a conference between Gen. Foch and Sir D. Haig on the 26th, and was finally embodied in a directive issued by the Allied Generalissimo on the 28th. It was therein laid down that the offensive should be conducted by the IV. British and I. French Armies, under the command of Field-Marshal Haig; that covered by the Somme, it should be pushed as far as possible in the direction of Roye, and that the road from Amiens to that place should be the dividing line

between the two armies. The date fixed, at first Aug. 10, was later advanced to Aug. 8.

*Preparation for the British Attack.*—An operation similar to that ordered had for some time been contemplated by the IV. Army, and preparations for it were therefore pressed on from July 26 onwards. At this date the army, under Gen. Rawlinson's command consisted of the Australian (Monash) and III. Corps (Butler), (8 infantry divisions and one cavalry division), on the front Albert-Villers-Bretonneux. By the date of the attack it had been reinforced by the Canadian Corps (Currie) (4 infantry divs., another Australian infantry div., and 2 cavalry divs.), while the artillery was brought up to a total of over 2,000 guns, the aircraft to 28 squadrons and the tanks to 456 machines, 96 being whippets. The difficulties of effecting the concentration of these masses of troops and material, while keeping it secret from the enemy, were successfully overcome by means of elaborate precautions surpassing even those taken by the Germans before their spring and summer offensives. The cavalry, whippet tanks and part of the artillery were moved into the IV. Army area by road, the remainder (far the larger proportion) of the troops and material, being brought up in the period Aug. 1-8 in some 300 special trains. It was regarded as of the utmost importance to keep secret the arrival of the Canadians; in order to deceive the enemy, the troops themselves were deceived; Canadian units were sent from Arras into the trenches in Flanders, and the corps was actually brought into line, only a few hours before the attack, relieving the right of the Australian Corps, which had by Aug. 1 taken over the front from the French as far as the Amiens-Roye road. The precautionary measures taken were entirely successful in their object of ensuring that no warning of the attack should reach the enemy.

The front of the IV. Army attack extended from the Ancre S. of Albert to the Amiens-Roye road, a frontage of some 13 m.; three successive objectives were assigned, at distances, respectively of about 2-2½, 3-5, and 6-8 m. from the original starting line, which would bring the army eventually on the line of the "Amiens outer defences," on the front Le Quesnel-Harbonnières-Morcourt. The country, open rolling downland, was favourable for the operations of all arms; the enemy's defences were not formidable. The hostile forces believed to be available to oppose the British, consisted of the LI, XI, and XIV. German Corps (seven divisions in first line and eight in support and reserve) belonging to Gen. v. der Marwitz's II. German Army.

By the morning of Aug. 8 all preparations for the battle had been successfully completed and the British forces were, all unsuspected by the enemy, about to enter on the first stage of their march to the Rhine.

*The British Offensive on Aug. 8.*—Punctually at 4:20 A.M. on the morning of Aug. 8 the British infantry and tanks, under cover of a powerful barrage, debouched to the assault. Thick ground-mist veiled their advance from the eyes of the Germans, who were completely surprised and in an instant overwhelmed with little resistance. The Canadian Corps sector extended from the Amiens-Roye road to the Amiens-Chaulnes railway; 156 tanks coöperated in the attack of this corps. Opposed to them was the 119th German Div., which was in process of being relieved by the 117th Division. The 3rd Canadian Div. on the right of the line, making light of the difficult task of debouching from a narrow bridgehead on the S. bank of the Luce river, set foot on the plateau between that stream and the Ayre, captured Hangard and Démuin, and by noon had carried its front forward to the second objective, between Cayeux and Mezières. Thenceforward the 3rd Cavalry Div. took up the advance, followed by the 4th Canadian Div.; the cavalry, after taking Beaucourt, were held up by machine-gun fire, and though the infantry when they arrived succeeded in pushing forward, it was not found possible to reach Le Quesnel, the final objective, which at fall of night was still strongly held by the enemy. The centre and left Canadian Div., and the 1st and 2nd, attacked each on a front of one brigade, employing a separate brigade for each successive objective; the 1st Div. met with little serious

opposition as far as the first objective, which it reached at 6:20 A.M. but the 2nd Div. only attained it an hour and a half later, having had heavy fighting at Marcelcave. At 8:20 A.M. the advance was resumed, and again the 1st Div. had the easier task, the German machine gunners putting up considerable resistance against the 2nd Division. Two brigades of the 1st Cavalry Div. now passed through to the front, and drove far into the hostile territory, capturing Caix, and attaining the final objective, in conjunction with the Canadian infantry, which moved behind them clearing up the ground already passed over by the cavalry. By 5:35 P.M. the Canadian Corps had, with the exception already noted on its extreme right, carried out its appointed task; it had penetrated the enemy's defences to a depth of over 8 m., capturing 12 villages, over 6,000 prisoners and 160 guns.

The Australian Corps advanced between the Amiens-Chaulnes railway and the Somme against the 41st, 13th and parts of the 108th and 43rd German Divs. The Australians had their 2nd and 3rd Divs. in first line and their 5th and 4th in support, the 1st Div. being in reserve N. of the Somme; 168 tanks were attached to the corps. The corps was drawn up by its commander in such a manner as to necessitate a double "leap frogging" of its divisions, while equalizing the exertions demanded of them and the distances to be traversed by them; and this complicated manœuvre was carried out with entire success. The 2nd and 3rd Divs., assisted effectively by the tanks, carried Warfusée and Cérisy, and then relinquished the attack to the 5th and 4th Divs., which pushed forward beyond Baronvillers and Morcourt, despite heavy flanking fire from the German artillery on the N. bank of the Somme. On the second objective being reached at 10:30 A.M. a brigade of the 1st Cavalry Div., with 16 whipper tanks, passed forward to Harbonnières, and an armoured car battalion raced forward down the Amiens-Brie road, scattering death and destruction far to the E. in the enemy's back areas. Behind them the Australians, throwing back their left to face the enemy on the N. bank of the Somme, pushed forward their centre and right to the final objective, just W. of the line Vauvillers-Proyart, where they found the cavalry held up. In the space of under six hours, between this opening of their attack at 6:20 A.M. and the attainment of the above line about midday, the Australian Corps had occupied seven villages, and taken over 8,000 prisoners, 173 guns and much other booty too numerous to mention.

On the N. of the Somme the operations of the III. Corps had not, however, met with the expected measure of success. It had been intended to advance with the 58th, 18th and 12th Divs. to a river from the line W. of Etinehem to W. of Morlancourt, thus securing the left flank of the main attack S. of the Somme; 34 tanks were detailed off to assist this attack. The programme of attack was disarranged by a partial advance of the enemy on Aug. 6 which forced back the 18th Div., and from the first moment difficulties were met with. Sailly Laurette was carried after stiff fighting by the 58th Div. and eventually the first objective was reached along the whole corps front. The further advance of the 58th Div. broke down against the resistance of the enemy holding the Chipilly spur and the 18th Div., which succeeded for a time in gaining ground farther to the N., were counter-attacked and forced to fall back. The enemy on the III. Corps front was not surprised, and fought well, and the attacking infantry were unable to find much support from the tanks, for which the ground was unsuitable in many places; 2,400 prisoners were taken by the III. Corps, together with 40 guns.

The results of what had undoubtedly been the most successful day's battle waged hitherto by the British army in the World War, and one of the finest British victories of all time, were the complete defeat of 11 German by 11 British divs., a gain of ground to an average depth of 6 to 7 m. on a front of 8, and the capture of close on 17,000 prisoners, 373 guns, several thousand machine-guns, and quantities of ammunition and stores. Most important of all, the battle revealed to the enemy Higher Command weaknesses hitherto unsuspected in their army, and destroyed the last hope of German victory. "It was," says

Ludendorff, "the black day of the German army in the war. It was the worst experience I had to go through. It marked the decline of our fighting strength and destroyed our hopes of a strategic improvement. To continue would be a gamble. The war would have to be ended."

*Operations of I. French Army around Montdidier (Aug. 8-11).* The plan of Gen. Fayolle, commanding the French reserve group of armies, involved not only the participation of Gen. Debeney's I. French Army in the British operations N. of Montdidier but a subsequent extension of the attack to the S. of that town by the right wing of that army and eventually as far as the Oise by the French III. Army (Gen. Humbert). Gen. Foch sanctioned this scheme on Aug. 3, and it was decided that the attack S. of Montdidier should take place on the 9th and that of Humbert's army on the 10th.

The French I. Army at this time held a line from the British right flank near Domart to Castel on the Avre and thence along the W. bank of that stream to Courcelles, S.E. of Montdidier, whence the French III. Army continued the line to the Oise. Debeney had under his command the XXXV., X., IX. and XXXI. Corps (in line in that order from right to left) and the II. Cavalry Corps in reserve, in all 12 infantry and 3 cavalry divisions. In face of him stood the 2 left divisions of the German LI. Corps, of von der Marwitz's II. Army, as far as Moreuil, and 7 divisions in line with 2 in reserve, belonging to Von Hutier's XVIII. Army, from Moreuil southwards. The enemy on this front had recently withdrawn his line behind the Avre as a result of several small French operations on the W. bank and was therefore well on the alert.

Debeney's plan for the forthcoming operations consisted first of an advance by his two left corps in the angle between the Luce and the Avre in conjunction with the British right, followed by the passage of the Avre and the Trois Doms and a rapid advance to the plateau around Hangest on both sides of Montdidier by his centre and right, and the capture of that place. The whole army was then to push forward astride the Avre in the direction of Roye.

This programme was carried out without a hitch. The French bombardment commenced at 4:20 A.M. on the 8th, the hour of the British attack, and the infantry and tanks of the XXXI. Corps debouched between the Luce and Moreuil at 5:15 A.M. The German LI. Corps on this part of the front, was, contrary to expectation, taken unawares and put up little resistance; many prisoners were captured while engaged in cutting corn in the fields. Moreuil was taken and the way cleared for the IX. Corps farther S., which about 9 A.M. began to cross the Avre on foot-bridges thrown under cover of darkness early that morning. Here there was stiff fighting, and it was not till late in the day that the tanks were got across the river and cleared the way for the infantry, which at nightfall had reached the line Fresnoy-Plessier. Behind the IX. Corps, the X. was passing the Avre, and preparing for its S.E. advance on the morrow to encircle Montdidier from the N., while the XXXV. Corps was about to execute a similar manœuvre from the south.

The second stage of the operations commenced early next morning, the 9th. In order to secure the left of the X. Corps in its advance on Montdidier the XXXI. Corps attacked Hangest and occupied it about 11 A.M. The X. Corps, passing the Avre and the Trois Doms in its turn, took over the IX. Corps, and, assisted by the latter's artillery as well as its own, pushed forward to the E., meeting with considerable resistance, while the XXXV. Corps, debouching against Assainvillers at 4 P.M., took the enemy by surprise and advancing some 3 m., reached and cut the Montdidier-Roye road near Faverolles. The garrison of Montdidier, their retreat threatened from two sides, fell back hastily under cover of darkness by the road to Guerbigny, leaving behind a rearguard which fell into the hands of the French X. Corps on their entry into the town on the morning of the 10th.

Debeney, urged by Foch in a personal letter "to push forward towards Roye and there join hands with the French III. Army" (which was due to open its attack between Courcelles

and the Oise on the 10th), decided, now his army was successfully reunited astride the Avre, to press his advantage in conjunction with the British on his left. The disaster to the German II. Army in the N. had rendered the position of the XVIII. Army, which was facing Debency, so difficult that it had to throw back its right flank to W. of Roye—a movement which was carried out on the night of the 9th. By the evening of the 10th the I. Army following up the retiring enemy had reached the line Andechy-Bus, and on the next day a further slight advance was made on either wing of the enemy, Lechelle and Tilloloy being taken by the XXXI. and XXXV. Corps.

By now the German XVIII. Army, although its attention was distracted by the advance of the French III. Army against its centre and left, was reconstituting a solid line in the old French zone of 1916. Von Hutier, whose forces had been increased from 15 to 18 divisions by the 11th, established them in depth on two successive lines of trenches, with a strong belt of wire in front, all lines of approach being swept by direct and indirect machine-gun fire. A continuation of the rapid advance of the French I. Army was under these circumstances out of the question, and it was necessary to resort to slower and more thorough measures for overcoming the German resistance which was day by day hardening in proportion as further fresh reinforcements arrived.

*Continuation of British Advance (Aug. 9-11).*—It was decided by Gen. Rawlinson that the IV. Army should on the 9th continue its advance to the line Roye-Chaulnes-Bray-Dernancourt. The main attack was entrusted to the Canadian Corps which was to push S.E. to the line Roye-Hallu, while the Australian Corps was to secure its left between the latter place and Méricourt, and the III. Corps to advance to Etinehem and form a strong defensive flank on the N. bank of the Somme.

The Canadian attack, on the 9th, failed to attain all its objectives. Assisted by the 2nd Cavalry Div., it none the less effected a deep advance of some 4 to 6 m., secured eight more villages, and halted for the night on the line Arrillers-Rosières. To its left the Australians advanced their front between the Chaulnes railway and the Amiens-Brie road as far as Lihons hill, W. of Lihons village, and Framerville, after stubborn fighting. The III. Corps, reinforced by an American detachment, carried all its objectives for the day, clearing the Chipilly spur and taking Morlancourt. The German II. Army, still much disorganized, had been reinforced by six additional divisions from the XVIII. and IX. Armies, sent up by train and lorry and thrown straight into battle, often without their artillery, and its resistance had noticeably stiffened.

The British advance was continued on the 10th. The Canadians, now opposed by fresh troops from the XVIII. German Army, succeeded in attaining with its left the front assigned to it at Hallu and Fouquescourt but failed to get its right forward to Roye, the western suburbs of which were stoutly held. The Australian Corps which had now extended its left astride the Somme, in order to secure effective co-ordination of the operations on both its banks, had severe fighting on Lihons hill and was held up by determined German counter-attacks. Operations were undertaken on both banks N. of the Somme under cover of darkness, the plan being to encircle the hostile positions in the Etinehem and Méricourt bends by drawing a cordon across the bases of these bends. Etinehem and all its garrisons were easily taken, but the attack on Méricourt was broken up by hostile bombing planes and had to be completed on the 11th.

The IV. Army orders for this day's operations were that the Canadians and Australians should continue their advance to the line of the Somme and secure the crossings from Offoy (E. of Ham) to Bray. During the 10th and 11th, however, 8 more German divisions had come into line and delivered a series of vigorous counter-attacks which had the effect of putting a stop to any real British advance. The Canadian attacks were cancelled and the Corps had hard work to hold its ground. The Australians captured and held Lihons but could get no farther.

In fact, it was now clear that to push the offensive further would lead to disproportionate loss with little corresponding

gain. The German II. Army had reformed its front, shattered on the 8th, with fresh troops drawn from the XVIII. and IX. Armies and from Prince Rupprecht's group in Flanders, and settled itself on the edge of the area devastated in the Somme battles of 1916, where a maze of old trenches, wire, and shell holes rendered defence easy and rapid advance impracticable. The British IV. Army had engaged all its 13 divisions, and its units were tired and in need of a breathing space. Gen. Rawlinson therefore decided on the 11th to allow his troops a few days' rest, while preparing for a renewal of the attack on the 15th. The units in the line were relieved and the tired infantry together with the cavalry were withdrawn into reserve.

*French I. Army's Operations (Aug. 12-22).*—On Debency's front also during this period, minor activity took place, resulting in merely local advantages to the French. On the left of the I. Army, the line was drawn closer to Roye on the N.W. and W., while on the right the XXXV. Corps took Reuvraignes on the 20th. In this area, however, the German XVIII. Army had put into line no less than 10 divisions, while on the whole front between Roye and Lassigny a total of over 20 divisions were engaged between Aug. 9 and 22 against the French I. Army. Thanks to the employment of these strong forces, and to the increasing facilities for defence afforded by the shattered and intersected country into which the battle line had now been carried, the German XVIII. Army was enabled to maintain its ground to the W. and S. of Roye until the pressure of events elsewhere compelled its withdrawal in conformity with the armies on either flank at the end of August.

The operations of the French I. Army since Aug. 9 had resulted in the reconquest of an area of ground to a depth of 10-15 m. and the capture of some 12,000 prisoners and over 100 guns, besides much other material and stores.

*British Operations (Aug. 12-22).*—The IV. Army offensive planned for the 15th did not take place and only partial actions were carried out on its front during the period from the 12th to the 22nd. British attacks alternated with German counter-attacks with no great change resulting in the situation. Thus on the 12th the Australians took Proyart, while on the 15th the Canadians secured Damery and Parvillers. On the 17th Sir D. Haig decided that the next large-scale attack by the British should take place on the I. and III. Army fronts; the Canadian Corps left the IV. Army, the French taking over its sector as far as S. of Lihons and the remainder of the IV. Army line, which on Aug. 22 ran from Damery by Lihons and Proyart to Dernancourt, was left to the 12 divisions of the Australian and III. Corps. Facing them the German II. Army had available 26 divisions, of which, however, only 16 were in good fighting trim.

During the period from Aug. 8 to Aug. 22 the IV. Army had forced back the Germans to a depth of 12 m., had defeated or engaged with its own 13 divisions no less than 27 of the enemy's, had taken from him 23,000 prisoners and 400 guns and had killed and wounded more than an equivalent number of his men at a cost to itself of some 27,000 total casualties.

*Offensive of French III. Army (Aug. 10-22).*—In accordance with the scheme of Gen. Fayolle, already mentioned, the attack of the French III. Army was launched on the early morning of the 10th. The XXXIV. and XV. Corps (7 divs.), on a front of 14 m., from Courcelles to the Oise, were opposed by 7 German divisions in line and one in reserve, forming the centre and left of the German XVIII. Army. The objective of the French offensive was assigned as the line Lassigny-Noyon. The nature of the ground in front of Humbert's right, a tangled and broken mass of wooded hills, known as the "Petite Suisse," forbade any rapid advance in that quarter, and recourse was had therefore to an enveloping movement by the left (XXXIV.) Corps of the III. Army, which was directed to turn the highland by the north. At 4:20 A.M. on the 10th the attack commenced without artillery preparation; little resistance was met with at first, and before noon a penetration of some 3 to 4 m. had been effected, the infantry reaching the front Onvillers-Macqueglise. The advance was continued during the afternoon against the high ridge of Boulogne, while French aeroplanes carried out a bombing raid

on Lassigny, and by nightfall the XXXIV. Corps was on the line Onvillers-Boulogne-La Neuville.

On the 11th the XV. Corps on the right of the army was put into the attack directly against the front of the "Petite Suisse," while the XXXIV. continued to progress to the N. of it. The resistance of the XVIII. German Army, reinforced by an extra division, stiffened appreciably during the day, and all along the line there was hard fighting. Hostile machine gunners ensconced in the broken country made the advance slow and painful; every foot of ground had to be fought for and the French could only advance step by step. After a week's fighting, the "Petite Suisse" still remained partly in German hands, while the French left wing was not yet in possession of Lassigny. The German XVIII. Army which, as already mentioned, had brought back its right flank to Roye on the evening of the 9th and was now also withdrawing its left along the Oise, fought stubbornly to secure time for the evacuation of its artillery and material. Nevertheless the French III. Army made daily headway.

It was not, however, till the offensive by the French X. Army on the E. of the Oise threatened by its rapid progress to imperil the retreat of the Germans in the "Petite Suisse" that Humbert's troops could finally force them from their stronghold. On the morning of the 21st the German XVIII. Army fell back all along the line; the French infantry occupied Lassigny and cleared the wooded highland and by the 22nd had reached the line of the Divette, where they were halted to regroup and prepare for a renewed advance.

In the thirteen days' fighting Humbert's 7 divisions had driven from their strong vantage ground 8 enemy divisions and had taken from them 5,000 prisoners and 100 guns.

*General Results of the Battle of Amiens.*—The course and results of the fortnight's fighting between Aug. 8 and 22 may be summed up as follows:—The three Allied armies engaged (IV. British, I. and III. French), with 32 divisions, had attacked and defeated the II. and XVIII. German Armies, in all 42 divisions. Of these 42 divisions 30 were originally in line or reserve at the moment of the attacks, and 12 were put in from other parts of the front, being drawn from seven different German armies, belonging to three different army groups. The Allies advanced to a depth of between 6 and 14 m. on a front of 47, taking a total of 40,000 prisoners, 600 guns, thousands of machine-guns, quantities of ammunition, *matériel* and stores of all kinds. A wide breach had been made in the German front, susceptible, as events showed, of being rapidly widened to either flank by further Allied attacks. A shattering blow had been dealt to the *moral* of the German army and the German Higher Command, from the effects of which neither was destined to recover. The Battle of Amiens was the first page in the story of the Allied victory of 1918.

(X.)

#### IV. BATTLE OF BAPAUME-PÉRONNE, AUG. 21-SEPT. 2

The first conception of the battle of Bapaume-Péronne was laid down in a directive from Marshal Foch to Field-Marshal Haig, written on Aug. 10—that is at the moment when the battle of Amiens had just been crowned with a brilliant success, and the enemy was retiring E. along the whole front from the Ancre to the Oise under the pressure of the British IV. and French I. and III. Armies. In this directive it was enjoined that "enterprises of the British III. Army in the general direction of Bapaume and Péronne should be prepared as soon as possible," while "the action of the British IV. Army should be pushed in the direction of Ham." Further instructions for the enlargement of the battle towards the N. to take place simultaneously with its extension to the S. by the advance of the X. French Army between the Oise and the Aisne (timed for Aug. 20), were sent to Haig on the 12 and it was finally decided that the advance of the III. Army should commence on the 21st and be followed by a general offensive on the front of that Army and the IV. Army two days later.

The general scheme of the operations between the Somme and the Scarpe was based, according to Lord Haig, on the following considerations:—

"The enemy did not seem prepared to meet an attack in this direction and owing to the success of the IV. Army, he occupied a salient, the left flank of which was already threatened from the south. A further reason for my decision was that the ground N. of the Ancre river was not greatly damaged by shell fire and was suitable for the use of tanks. A successful attack between Albert and Arras in a S.E. direction would turn the line of the Somme S. of Péronne and gave every promise of producing far-reaching results. It would be a step forward towards the strategic objective St. Quentin-Cambrai. This attack moreover would be rendered easier by the fact that we now held the commanding plateau S. of Arras about Bucquoy and Ablainzeville, which in the days of the old Somme fighting had lain well behind the enemy's lines. In consequence we were here either astride of or to the E. of the intricate systems of trench lines which in 1916, we had no choice but to attack frontally, and enjoyed advantages of observation which at that date had been denied us. It was arranged that on the morning of Aug. 21 a limited attack should be launched N. of the Ancre to gain the general line of the Arras-Albert railway, on which it was correctly assumed that the enemy's main line of resistance was sited. The day of Aug. 22 would then be used to get troops and guns into position on this front and to bring forward the left of the IV. Army between the Somme and the Ancre. The principal attack would then be delivered on Aug. 23 by the III. Army and the divisions of the IV. Army N. of the Somme, the remainder of the IV. Army assisting by pushing forward S. of the river to cover the flank of the main operation. Thereafter if success attended our efforts, the whole of both armies were to press forward with the greatest vigour and exploit to the full any advantage we might have gained."

The line of the British IV. Army at the date of the opening of the new battle on Aug. 21 ran from Fransart by Chilly, Proyart and Dernancourt to Albert. The right of this line as far as the Bray-Corbie road was held by the Australian Corps (Monash) with five divisions (from the right, 4th Canadian, 4th Australian, 32nd, 5th Australian and 3rd Australian) in line and three (1st Canadian, 1st Australian and 2nd Australian) in reserve. To the left of this the III. Corps (47th, 12th and 18th Divs. in line and 58th in reserve) continued the line to the army boundary northward of Albert on a front running along the W. bank of the Ancre as far as Beaucourt and thence W. of Puisieux, Bucquoy and Moyenneville to the Cojeul. The III. Army held the line in order from the S. with the V. Corps (Shute) with the 38th and 21st Divs. in line and the 17th in reserve, from N. of Albert to Beaucourt; the IV. Corps (Harper) with the 42nd, New Zealand and 37th Div. in line and the 5th and 63rd in support, extending as far as opposite Ablainzeville; and the VI. Corps (Haldane) (2nd Guards, 56th and 52nd Divs. in front line, with the 3rd in rear), as far as the army boundary.

Facing these troops the German II. Army (v. Marwitz) held the front opposite the IV. British Army, from N. of Roye to N. of Albert. This army, after its battering on Aug. 8 and succeeding days, held its front with 16 divisions, retaining 7, mostly exhausted and reduced in numbers, in reserve. The XVII. Army (Otto v. Below) was on the right of the II. extending as far as Avion, S. of Lens. On the eve of the attack this army had 11 divisions in first line and 2 in reserve. Both of these armies, together with the IX., to the left of the II., belonged to the newly-formed Army Group of von Boehm, whose area of command thus extended from N. of the Scarpe to the Aisne.

*First Stage of III. Army's Advance (Aug. 21-26).*—The main attack on the front of the British III. and IV. Armies was timed for Aug. 23 and the two previous days were to be in some sense only a prelude. The operation to be undertaken on Aug. 21 consisted of an advance by the IV. and VI. Corps on a front of 9 m. from opposite Miraumont to Moyenneville, while the left division of the V. Corps secured the right flank of the attack along the Ancre. The general objective was to be the line of the Arras-Albert railway, the attainment of which involved a penetration of the hostile front to a depth of 2 to 3 miles.

The attacking infantry, supported by tanks and covered by a strong barrage, moved forward at 4:55 A.M. The enemy was fully aware of the probability of an offensive on his XVII. Army sector and had adopted his well-tried system of defence in depth, the positions forward of the railway being lightly held by weak forces. These were rapidly driven in along the whole front of attack, their task being rendered difficult both by thick mist and smoke thrown out to cover the advance of the assaulting infantry.

While the 21st Div. of the V. Corps pushed forward along the right bank of the Ancre as far as Beaucourt and set to work to prepare a passage over the flooded and marshy stream at St. Pierre Divion, the 42nd, New Zealand, and 37th Divs. of the IV. Corps carried their first objective, the high ground E. of Bucquoy and Ablainzeville, and then gave place to the 5th and 63rd Divs., which carried the line up to the final objective W. of the railway. Further to the N. the 2nd and Guards Divs. of the VII. Corps, assisted by the 3rd Div., which was leap-frogged over the 2nd for the last stage of the advance, also carried out their allotted task, and though the fog, which had at first favoured the attacking troops caused some little confusion and loss of direction, succeeded not only in reaching but in crossing the railway E. of Courcelles and Moyenneville. Over 2,000 prisoners were captured along the front of attack, of which 1,400 fell to the lot of the IV. Corps.

The German XVII. Army, in view of the loss of its forward positions, requested permission to retake them by a counter-offensive, which was delivered in force on the 22nd, and drove in parts of the new line both in the IV. and VI. Corps sector. It failed however to gain any decided advantage, as the Germans themselves admit, and meanwhile the preparations for the general advance on the whole of the IV. and III. Army fronts on the 23rd were being rapidly completed. At the point of junction of the armies the 38th Div. of the V. Corps, in co-operation with the III. Corps, carried out a series of operations which had as their result the occupation of Albert, and the seizure of points of passage which rendered it possible to throw strong forces to the E. bank of the Ancre in preparation for the morrow.

The main phase of the III. Army's operations began in the morning of Aug. 23, the various formations attacking at different hours along the whole front of 16 m. from Albert to the Cojeul. The enemy resisted with determination, but considerable progress was made all along the line. On the right the V. Corps, still acting in close conjunction with the III. Corps to the S. of it, pushed out its right, the 38th Div., E. and N.E. from Albert and completed its occupation of the hills overlooking the town. By the end of the day this division held a line from just W. of La Boisselle to Aveluy, while its left brigade had thrown parties across the marshes E. of Hamel, where they held on all night in face of repeated German attacks. On the front of the 21st Div., on the left of the V. Corps, only small attacks took place, but the IV. Corps to the N. of the Ancre, commencing its advance at 11 A.M., with the 42nd, New Zealand, 5th and 37th Divs., carried the railway, the enemy's main position, from N. of Miraumont to Achiet le Grand, and pushing forward further on the left, reached a line from Bihucourt to Loupart Wood, whence the front at the end of the day ran sharply westwards N. of Ires and N. and W. of Miraumont. On the VI. Corps the attacking divisions, from right to left were the 2nd, 3rd, Guards, 56th and 52nd. The 3rd Div. opened the advance at 4 A.M. with a successful attack on Gomécourt, after which at 11 A.M. the 2nd Div. passed through on either side of the village to continue the advance, its objective being the line of the Arras-Bapaume road between Sapignies and Ervillers. The right of the attack made little progress, but on the left Ervillers was taken early in the afternoon. Farther N. the Guards, after seizing Hamelin-court, had also established themselves across the main road, and Boyelles and Boiry Bequerelle also fell into the hands of the VI. Corps before the end of the day, which resulted in the capture of 5,000 prisoners and a number of guns.

In view of the success gained during the day, it was decided to renew the advance at 1 A.M. on the morning of the 24th, the moon being then at the full. This decision was fully justified by the excellent results achieved all along the line. On the V. Corps front, it was projected to carry the strong position on the Thiépval plateau by means of a converging attack from S. and W. by the two wings of the 38th Div. While the right brigade stormed the high ground of La Boisselle and Ovivillers, the left brigade, wading across the Ancre at Hamel under cover of its detachments thrown over the previous day, pushed forward as far as Pozières, thus turning the defences of Thiépval from the north. In the after-

noon and evening the V. Corps, of which the central and left Divs., the 17th and 21st, had pushed forward through Grandcourt, by dint of heavy fighting, attained the general line W. of Contalmaison-Martinpuich-Courcelette. The IV. Corps had also been highly successful; the 42nd Div. pushed its front by way of Miraumont, where the enemy resisted with unusual stubbornness, to Pys, while the 5th, New Zealand, and 37th Divs., farther N., advanced to the line Grevillers-Avesnes-W. of Behagnies-Mory. The VI. Corps on the left of the army occupied St. Leger and Henin-sur-Cojeul but were held up by a determined defence in front of Croisilles and in St. Martin-sur-Cojeul.

The attack was vigorously pushed on the 25th despite the fact that the troops were becoming weary and the enemy's line heavily reinforced, showed signs of stiffening. The main advance was in the centre; the V. Corps on the right advancing over the old battlefields of 1916 where the ground afforded good facilities for the defence could get on but slowly, and the enemy's prepared fortifications gave him every advantage in the VI. Corps area, where little progress could be achieved. In the centre however, N. of Bapaume, the IV. Corps cleared up the hostile resistance at Sapignies and Behagnies and pushed on in the evening to the line Favreuil-Mory, thus seriously menacing the line of retreat of the defenders of Bapaume.

In fact, at this moment the situation on the front of the XVII. German Army was regarded as "extremely critical." It was believed that the offensive against it was bound to continue and the difficulty of getting up reserves and supplies was enhanced by the lack of communications across the desolated area of the old Somme battlefields. The Army Group of von Boehm was accordingly instructed to retire the line of the XVII. Army to a position already reconnoitred and partly prepared running from Quéant E. of Bapaume and Combles. The withdrawal took place at once in accordance with orders, and was completed by the morning of the 27th under cover of strong rearguards which fiercely contested the advance of the British III. Army.

*Conclusion of III. Army's Advance (Aug. 26-Sept. 1).*—During the 26th the V. Corps gained the fruit of its hard struggles of the previous days in a deep advance over the Somme battleground, which carried it forward to the western outskirts of what had once been the villages of Longueval, Flers, and Le Sars. The IV. Corps continued to swing round to the N.E. of Bapaume, occupying Beugnâtre, but the garrison of the town still held out. The next few days were taken up with bitter and strenuous fighting along all the front of the army, which grew stiffer as the advancing British drew nearer to the new prepared positions of the enemy. A new British Corps, the XVII. (Ferguson), took over the three left divisions (56th, 52nd and 57th) of the VI. Corps on the evening of Aug. 25, and undertook the hard task of overcoming the German resistance around Croisilles and in the Hindenburg line to the E. Croisilles was not finally secured until the 28th when the enemy garrison, finding its retreat menaced from both flanks, abandoned it early in the morning and from that date for four successive days the XVII. Corps was engaged in to-and-fro fighting in the maze of trenches and dugouts around Bullecourt and Hendecourt which were finally secured by the 52nd and 57th Divs., respectively, on the morning of Sept. 1. The line was established E. of Rencourt by the evening. The part of the XVII. Corps in the brilliant operations of the I. Army against the Drocourt-Quéant line on Sept. 2 does not come within the scope of this narrative.

Further to the S. by the evening of Aug. 29 the Germans, though still holding their ground stubbornly before the VI. Corps, had left Bapaume to the New Zealand Div. of the IV. Corps, and retired before the V. Corps to the eastern edge of the devastated area on the general line Morval-Beaulencourt. Following up their advantage the IV. Corps pressed their advance on Aug. 30 and 31 to beyond Rencourt, Bancourt and Frémicourt, thus rendering it possible for their neighbours on the right and left to resume their progress which had for the moment ceased. While the V. Corps on Sept. 1 drove the enemy from Beaulencourt, Morval and Sailly-Saillisel and on the 2nd from Le Transloy, Rocquigny and Barastre, the VI. Corps finally

made itself master of the bitterly contested villages of Ecoust and Vaux Vrancourt and pushed forward to Noreuil. The IV. Corps in the centre, keeping pace with its comrades reached the front Villers au Flos-Beugny on the evening of Sept. 2.

During the 13 days' fighting the 14 divisions of the III. Army had engaged 23 hostile divisions, taken from them 11,000 prisoners, many guns and much material of war, and had driven them back to a depth of from 8 to 13 m. on a front of 20, besides inflicting on them heavy losses in killed and wounded.

*IV. Army's Advance to Upper Somme (Aug. 22-30).—*It has already been stated that the left of the IV. Army N. of the Somme had successfully coöperated in the main advance being carried out by the III. Army on its left during all the period under review from Aug. 22 onward. At the same time, other offensive operations were also carried out by the centre and right of Gen. Rawlinson's line astride and S. of the river, which had the effect towards the end of Aug. of forcing the Germans to retire to the line of the Somme above Péronne.

The attack of the III. Corps, delivered on the morning of Aug. 22, had for its objective the capture of Albert and the crests E. and S.E. of it in order to afford a crossing-place for the V. Corps (the right corps of the III. Army) over the Ancre valley. The 18th, 47th and 12th Divs., as also the 3rd Australian Div., were entrusted with the operation, which involved an advance of some 2,000 to 3,000 yd.; the 58th Div. was held in reserve. Despite the fact that all the precautions taken failed to ensure secrecy and that hostile counter preparations began at 4 A.M., 45 minutes before the attack was timed to commence, considerable progress was made on the whole front. The 18th Div. cleared Albert and joined hands E. of Méculte with the left of the 12th Div., which together with the 47th on its right, had reached practically all its objectives before noon. The 3rd Australian Div. on the extreme right of the attack had also fulfilled their allotted task as early as 8:30 A.M. But in the afternoon a heavy German counter-attack, put in against the centre of the new British line, recovered much of the lost ground in that quarter, and inflicted such severe losses on the 47th Div. that it had to be relieved during the course of the next day by the 58th Div. from reserve.

This untoward incident somewhat disarranged the army plan for the 23rd, which had originally involved an advance on the whole front from Albert to Chaules. It was now decided that only the 18th Div. on the extreme left of the III. Corps should attack in conjunction with the Australians S. of the Somme. Accordingly, on the morning of the 23rd, the 18th Div., acting together with the V. Corps of the III. Army on its left, completed its operations of the previous day by the capture of the ridge immediately E. of Albert. The Australian attack to the S. was more ambitious and equally successful. It was carried out on a front of 4 m. by the 32nd Div. on the right and the 1st Australian on the left and involved an advance of some 2,000 yd. in depth, right up to the edge of the area laid waste in 1916, on the approximate line Herleville-Chuignes-Cappy. The divisions debouched at 4:45 A.M., assisted by 45 tanks and covered by an excellent barrage. The 32nd Div. early seized Herleville and the 1st Australian Div. also successfully carried out the first two stages of its advance, but met with unexpected difficulties in the last phase, which were only overcome after severe and gallant fighting. As a result of the day, 3,000 prisoners and 23 guns remained in the Australian Corps' hands.

Gen. Rawlinson decided, as a result of the day's operations, to go on with the attack N. of the river, and by way of variation to the usual methods an advance was carried out just after midnight of the 23rd by the whole of the III. Corps (47th, 12th and 18th Divs.) and the 3rd Australian Division. With the aid of the brilliant moonlight, good progress was made by all these formations, and despite violent hostile reaction, the ground lost on the 22nd was entirely recovered and La Boisselle, Bécordel and Bray all taken and held. The same good success attended the continuance of the advance next day, Fricourt and Mametz being both seized.

It had by now become evident, in fact, that the German re-

sistance on the IV. Army front, partly owing to the vigorous pressure exercised throughout the last four days, partly owing to the successes of the III. Army farther N., was beginning to weaken, and that only strong rearguards were being encountered fighting to gain time for the retirement of the main body behind the line of the Somme above Péronne. The German Higher Command, as already mentioned, on the 25th, ordered von Boehm (who had about the middle of Aug. been appointed to the command of a new Army Group consisting of the II., XVIII. and XI. Armies, between the Ancre and the Aisne) to fall back to the line of the river Somme-Ham-N.E. of Noyon, and the movement was carried out on the 26th and 27th. During these days the progress of the IV. Army was rapid, being opposed mainly by long range artillery fire and strong machine-gun detachments. By the evening of the 27th the Australian Corps, which had handed over part of its line, as far N. as beyond Lihons, to the French I. Army on the night of the 24th, had reached the front Vermandovillers-Fontaine-Vaux, while the III. Corps which had been severely tested by the resistance of three fresh enemy divisions newly put into line on its front had cleared Trones Wood and Longueval. The German II. Army had now reached its chosen positions of defence between Morval and Pargny but had apparently, at the desire of the Army Group which considered it important to retain the possibility of flanking movement from in front of Péronne against any eventual British advance in the open country to the N., decided to retain its hold on the W. bank of the river in that quarter. Accordingly, the resistance in that area, where the left of the Australian Corps was operating, grew stiffer during the 28th and 29th; while the 32nd Div. on the right of the corps reached the W. bank of the Somme astride the Amiens-Brie road without severe fighting early on the 29th, the 5th and 2nd Australian Divs. only established themselves on the river line after heavy fighting and thanks largely to the coöperation of the 3rd Australian Div. on the N. of the Somme. By the evening of the 30th the Australian line ran along the W. bank from Cizancourt in the S. to Blaches and thence over the river to Clerly and was continued by the III. Corps along the western edge of Marrières Wood to Priez Farm and E. of Combles. The Germans in this latter area had also fought stubbornly during the past two days and it became evident that they were here standing on a chosen line of defence. In view, however, of the small prospect of success afforded by any attempt to force the strongly held Somme line above Péronne, the IV. Army Command decided that the next operation must be a strong advance by the centre and left in order to turn that line to the N. and orders to this effect were issued on the evening of the 30th.

*Forcing of the Somme Line by IV. Army (Aug. 30-Sept. 2).—*The plan for the IV. Army's further operations involved the turning of the Somme line, to which the German II. Army had retired, by means of an advance N. of Péronne to the high ground around Nurlu. The III. Corps was to carry out the frontal attack from the W. against the German line northwards from Péronne, while the Australian Corps covered the southern flank of the attack and coöperated in the main operation by pushing forward against Nurlu from the S.W. Before this could be done, however, it was necessary to occupy Péronne and the key to it, the commanding height of Mont St. Quentin. This in itself was a most formidable task, for the position, strong both by nature and by art, dominated all the country to N. and W., and all the river passages by which it could be approached. The German High Command fully realized its importance, and had committed its defence to the picked troops of the 2nd Guard Div. with orders to hold it at all costs.

Sir John Monash, the Australian Corps commander, had already on the 29th formulated his plans for the attack of this stronghold. On this date the line of the corps was held from S. to N. by the 32nd, 5th, 2nd and 3rd Divs., the last-named being N. of the Somme. The idea was to bring over the 5th and 2nd Divs. to the N. bank, for the attack of Péronne and Mont St. Quentin respectively. The seizure of a bridgehead on the N. bank S.E. of Clerly, an essential preliminary, was carried out by the 2nd Australian Div. during the course of the 30th, and the

bridge at Ommécourt was ready for use by before dawn on the morrow. On this same night the 32nd Div. on the corps, right extended its front to the N., relieving part of the 5th Div. which in turn took over part of the front of the 2nd Div., thus liberating the necessary forces for the assault.

This was opened at 5 A.M. on the 31st by the 5th Bde., of the 2nd Div. which moved off under cover of a strong barrage and making good progress had attained by 7 A.M. both Feuillaucourt and Mont St. Quentin villages; the right of the brigade however was held up in front of Anvil Wood. To the left of the brigade also the attack of the 3rd Australian Div. had failed to keep pace and a heavy German counter-attack, flung in against the front and left of the troops holding Mont St. Quentin village, compelled them to relinquish it. They rallied again, however, on the western edge and there held their ground till nightfall. Feuillaucourt had also to be abandoned later in the day. Meanwhile the 6th Bde. (also of the 2nd Div.) crossed the river behind the 5th and part of it pushing forward on the right of its comrades, seized Halle and established itself on a line beyond. The remainder halted S.E. of Clerly. The 14th Bde. of the 5th Div., also effected a crossing at that place and collected E. of that village, pending the moment when the further advance of the 2nd Div. should allow it to advance against its assigned objective Péronne. By nightfall the 1,200 fighting men of the 5th Bde. had already broken the back of their task. Despite the difficulties which faced them, they had penetrated the formidable hostile positions to a depth of some 2,000 yd., and though reduced in numbers to some 600 rifles had held out on a wide front of 4,000 yd. against reiterated and desperate counter-blows by a foe in every way worthy of their steel. Their single feat of arms was rightly judged one of the finest in the war, and was to receive full fruition on the morrow.

The 6th Bde. of the 2nd Div., assembled S.E. of Clerly, was assigned to complete the capture of Mont St. Quentin, passing through the sorely tried 5th Bde., its units already in the front line S.E. of Halle being relieved by the 14th Bde. of the 5th Div., which now undertook the attack on Péronne. While this last-named brigade swept forward through Anvil Wood and Ste. Radegonde, forced its way into Péronne and got possession before noon of practically all the town with the exception of the north-eastern suburbs, the 6th Bde., despite strong opposition from parties of the enemy still at large behind the 5th Bde. front on the Péronne-Bapaume high road, reached the line of that road and after a short preparation by artillery stormed Mont St. Quentin village and wood and established itself on a line from there N. to near Allaines and S. to the E. edge of Péronne. The night of Sept. 1 thus saw the Australian Corps, the 3rd Div. of which on the extreme left had taken possession of the ridges S. of Bouchavesnes, in possession of all its objectives, after completely defeating the enemy opposed to it.

Further to the N. the III. Corps also had done most creditable, if less spectacular work, during these two days of battle. The 58th Div. on the right had cleared Marrières Wood on the 31st, while the 47th Div. made progress towards Rancourt, repulsing a hostile counter-attack. On the morrow these successes were continued and completed by the capture of Rancourt and Bouchavesnes, while the 18th Div. on the left of the corps in a brilliant series of attacks seized in turn Priez farm, Frégicourt and Saillisel, inflicting serious losses on the enemy, who afforded a stubborn resistance.

Sept. 2 saw the completion of the successful operations of the IV. Army in the battle of Péronne, the Australian Corps occupying Allaines and the III. Corps St. Pierre Vaast and Vaux woods. The results of the battle were imposing enough even in mere figures. In the period between Aug. 22 and Sept. 2 the IV. Army's 9 divs. had engaged and defeated 23 hostile divs. and taken from them over 23,000 prisoners, many guns and vast quantities of material. The strong line of the Somme had been turned and rendered untenable by sheer hard fighting in which the attacking troops had shown themselves capable of meeting and defeating the best of the German divisions which, thrown in piecemeal and in the utmost haste and confusion as they arrived

on the field, had been unable to hold for long even the strongest natural and artificial defences.

*General Results of the Battle of Bapaume-Péronne.*—In the battle described above the British III. and IV. Armies, consisting of five corps (23 divs.) in all, had fought and defeated the German XVII. and II. Armies, consisting of five corps (46 divs.), had forced them to fall back to a depth of from 6 to 13 m. on a front of 28, and had captured from them a total of 34,250 prisoners and 270 guns, without reckoning other material of war too various to recapitulate. The whole area of the Somme battlefields, which had cost the British five months' bitter fighting in 1916, had been conquered in less than a fortnight; more than half the area gained by the great German advance of the spring had been recovered; the only good natural line of defence available for the enemy to the W. of the Hindenburg system had been broken asunder; and the moral and material superiority of the British over the German fighting machine had become patent to the world. (X.)

**SONNINO, SIDNEY, BARON** (1847— ), Italian statesman (see 25.416). During the debates on Giolitti's Steamship Subsidies bill in the spring of 1909 it was Baron Sonnino who conducted the most vigorous attacks against the Government, exposing the radical defects of the measure, and when Giolitti resigned on Dec. 2 it was Sonnino who was called upon to form a ministry, for the second time. But he did not enjoy the favour of the still Giolittian Chamber, and his Cabinet was defeated over the new shipping bill. On March 21 1910 he resigned, again after 100 days of office. He continued to take an active part in the debates in the Chamber, and was a stern but just critic of Giolittian political methods, although during the Libyan war he generally abstained from opposition for patriotic motives. In the autumn of 1914, after the death of the Marquis di San Giuliano, the Premier Salandra assumed the Foreign Office for a short time, but when he reconstituted his Cabinet on Nov. 5 he offered that portfolio to Sonnino, who accepted it. His conduct of the Foreign Office was characterized by sincerity of purpose, high principles, unswerving patriotism and a wide knowledge of international politics. He had not, moreover, a free hand. He was still Foreign Minister, under Orlando's premiership, during the Peace Conference, which he attended as second Italian delegate from Jan. 18 to June 19 1919. On the fall, however, of the Orlando Cabinet (June 19 1919) Sonnino retired into private life. The irritation of the whole of Italy against the policy of the Allies towards Italy at the Peace Conference reacted to some extent against the nation's representatives at Paris, and Sonnino himself came in for a large share of unpopularity, although the more intelligent and better informed part of public opinion realized the great difficulty of his task and the insufficient support afforded him by Orlando, as well as the value of his actual achievements. He did not stand for Parliament at the elections in Nov. 1919, but was subsequently made a senator. In spite of what was regarded as his failure to overcome the obstacles of the Peace Conference, he enjoyed the reputation of being the greatest Minister for Foreign Affairs that Italy had had since Cavour, with the possible exception of Crispi, while as a financier he ranked very high. He was also a man of wide reading and culture, and a distinguished Dante scholar and bibliophile.

**SOROLLA Y BASTIDA, JOAQUIN** (1863— ), Spanish painter (see 25.434), was engaged for practically the whole of the decade 1910–20 on work for the Hispanic Society of America. It includes a series of portraits of Spanish writers, and a "Panorama of the Forty-nine Provinces of Spain" consisting of forty-nine immense compositions, each representing views, costumes and customs of a different province. This great undertaking was completed before paralysis brought the artist's painting to an end. Important exhibitions of his work were held at the Grafton Galleries, London, 1908; in New York, 1909; in Chicago, 1913; and he was represented by two typical works in the 1920–1 Exhibition of Spanish Paintings at Burlington House.

See Hispanic Society of America, *Eight Essays on Joaquin Sorolla y Bastida*; 1909; A. de Beruete y Moret, *Sorolla y Bastida*, 1920.

**SOUND** (see 25.437).—The increase in our knowledge of the subject of acoustics (the science of Sound) during recent years has been largely associated with the war conditions which prevailed from 1914 to 1918. As a consequence of the war the development of this science has been abnormal,<sup>1</sup> and research has been directed towards the rapid realization of practical acoustic devices and methods for immediate use in warfare, both on land and sea. A general survey of the work done shows that the advances consist of applications of well-established principles, rather than the discovery of new phenomena. Generally, the observations made have proved to be in accordance with previous theoretical investigations, mainly due to the late Lord Rayleigh.<sup>2</sup> This war work falls naturally under two headings, viz. (1) the detection and perception of direction of sounds in air, and (2) the detection and perception of direction of sounds in water. Theoretically, these two problems have much in common, but, practically, there are important differences which make it desirable to treat them in separate sections. A special section (3) is devoted to the important advances recently made in auditorium acoustics, and the remaining section (4) deals briefly with miscellaneous outstanding features of modern work on sound, not essentially military in character.

### 1. DETECTION AND PERCEPTION OF DIRECTION OF SOUNDS IN AIR<sup>3</sup>

**Detection.**—The human ear itself is a remarkably sensitive detector of the air vibrations which constitute sound. It is still much superior in this respect to any mechanical device which has yet been produced for recording the vibrations visually. Thus the perception of feeble sounds of necessity depends upon the limitations of audibility, either indirect listening, or with the ear aided by the intervention of an electrical device such as a microphone. The audibility of a feeble sound can be very largely augmented by making use of the principle of resonance, provided that the sound itself approximates to a pure tone. This can be secured, for example, by the use of a Helmholtz resonator applied to the ear in the case of direct listening, and in addition, by tuning the diaphragm receiver when microphonic listening is adopted. It has happened fortuitously that one of the chief sounds in air which it is important to be able to detect, viz. those emitted by aircraft, do contain predominant notes which enable the application of resonance, as above indicated, to increase largely the range of audibility. Typical predominant frequencies (apparently due to engine exhaust) are given in the following table, which relates to the engine running at the usual speed:—

Aeroplane engine	Frequency (vibrations per second)
S. E. 5 . . . . .	130
R. E. 8 . . . . .	90
F. E. 2B . . . . .	70
Avro . . . . .	90
Gotha . . . . .	80

<sup>1</sup> Owing to the abnormality of the conditions, it is impossible to follow the usual practices in writing the present article. Experiments on sound, with military ends in view, have been carried out in nearly all the belligerent countries. Comparatively few of the results have found their way into the recognized scientific journals, largely by reason of the secrecy which is still frequently enforced by the various Governments, under whose control most of the work was done. In the circumstances it is not safe to attempt to assign credit to particular investigators, nor is it possible to give adequate references. The present article has been drawn up, therefore, upon broad general lines which, since they fulfil censorship conditions, form necessarily a by no means complete survey; and names have been avoided as far as possible.

<sup>2</sup> Lord Rayleigh's work is contained in his *Collected Papers* (No. 6, 1920). His contributions were numerous between 1911 and 1919, when he died.

<sup>3</sup> The information contained in this section is largely drawn from a manual entitled *Development of Sounds*, kindly placed at the writer's disposal by the British Munitions Inventions Dept.

The following frequencies have been detected in the sounds from the Maybach engines of a Zeppelin airship:—

Slow speed—27, 54, 108, 135, 243.  
High speed—57, 114, 171, 228.

The operation of the *Doppler effect*, arising from the relative motion between the aircraft and the observer, prevents the possibility of the identification of the machine by means of the observed frequency, this being liable to change by as much as 20%, according to the speed and direction of flight. An interesting observation which has been constantly made is that the notes of low pitch continue to be heard at ranges where those of high pitch have ceased to be audible. This is in accordance with the theoretical expectation that damping increases with frequency.

The determination of the direction whence a sound arrives is theoretically possible by a variety of methods dealt with below, several of which have been tried in aircraft localization.

(a) *Binaural Listening.*—Lord Rayleigh's experiments (*Collected Papers*, vol. 5, p. 347) have shown that low-pitched sounds are determined in direction by the observation of the phase difference between the vibrations arriving at the two ears. This principle has been applied in direction-finding, and the effect has been exaggerated by increasing the distance between the two points of reception. The sound is received by two equal trumpets or horns rigidly connected together and capable of rotation about an axis perpendicular to the line joining them. Separate and exactly equal tubes lead from the trumpets to the two ears, respectively, and the apparatus is rotated until the sound under observation appears to come from directly in front. The line joining the sound receivers is then perpendicular to the incident sound stream. An alternative method which dispenses with the necessity of rotating the apparatus is to use a *compensator* or *phase-measurer*, which consists of tubes, adjustable in length, inserted between the sound receivers and the appropriate ears, so as to provide a path difference equal to that between the distant source of sound and the two receivers. Adjustment of the tube lengths is made until the impression received is that the sound is neither to the right nor to the left, and the determination of direction is then a matter of simple geometry. In practice the compensator is graduated to give direct angular readings.

The practice of binaural listening has verified theoretical conclusions in several important respects. It has been found that it is easier to perceive the direction of a mixed sound, or noise, than a pure note. Apparently it is necessary that the wave train should contain more or less isolated special characteristics whereby the phase difference can be readily appreciated. In the regular sine wave corresponding to a pure tone each vibration is exactly like those which immediately precede and follow it, and the ears are unable to identify corresponding displacements. It is apparently also necessary for successful binaural listening that the two portions of the incident wave which enter the two receivers should be free from subsequent distortion; in particular, that the sound receivers should be as nearly as possible non-resonant for the vibrations in question. Any amplification of the sound which depends upon resonance, therefore, such as the use of Helmholtz resonators already referred to, is incompatible with efficient direction-finding by observations of phase difference.

The construction and arrangement of the receivers used has varied very much in practice. As a typical system, that commonly used in the British army may be quoted, namely, circular cones, 2 to 4 ft. long and of semi-angle 20°, as receivers, placed about 7 ft. apart—a distance which proved to be sufficient for attaining nearly the maximum practical accuracy of setting.

The method is subject to many errors, chiefly those arising from the motion of the sound source, refraction due to temperature inequalities in the air, and the effect of winds. The necessary corrections are tabulated for use in practice.

(b) *Sound Mirrors.*—Some success has been attained in direction-finding by means of concave sound reflectors. The chief limitations have arisen from the question of size, and, consequently, of

<sup>4</sup> This method of perception of direction has been largely used also in a connexion which scarcely justifies treatment in a separate section. The *geophone* is an instrument for direction-finding of sounds proceeding through the earth, and its particular use during the war was for localizing the sounds of picks, etc. used in tunnelling and land mining. It consists of two hollow boxes connected by equal tubes to a stethoscope arranged so that the sounds proceed from the two boxes to separate ears. The boxes are laid upon the ground a few feet apart, and moved about until the sounds of the pick appear to come from straight ahead. It is then known that the sound source is on a line perpendicular to that joining the two geophone receivers, since the sounds arrive through the earth in synchronism. By combining several pairs of geophones separated by considerable distances, the actual position of the pick can be estimated, for it lies at the intersection of the several perpendiculars above specified.

portability. In optics the size of mirrors commonly in use is very great in comparison with the wave-lengths of the light; in the corresponding problem in acoustics it is almost impossible to make them so; and yet this is a necessary condition for the geometrical laws of reflection to apply with accuracy. In the largest sound mirrors—perhaps 20 ft. in diameter—the size is at most only a few wave-lengths for the aircraft sounds under investigation, with the result that the image of a distant sound obtained at the focus proves to be an area much larger than that corresponding to optical calculations. There is therefore no advantage secured by making the mirror paraboloidal instead of spherical, and considerable roughness of the surface is not detrimental. The mirrors were usually made of concrete, and listening was effected either by means of a small horn receiver placed in the focal plane and connected by a tube to the ears, or by means of a microphone placed in a similar position. If, as was more usual, the mirror was fixed, the direction of the sound source could be found by determining the position of maximum intensity in the focal plane. It may be noted that in this method of direction-finding amplification is obtained on account of the area of the mirror, and that further augmentation is attainable by using resonators, to which the same objections do not apply as in binaural listening. The accuracy of the determinations vary very much with frequency, being much greater for notes of high pitch than for low, as would be anticipated from considerations of wave-length.

(c) *Interference and Diffraction Methods.*—There have been many attempts to apply the principle of interference as a substitute for binaural listening, i.e., by ultimately mixing the sounds entering the two receivers, instead of leading them to different ears, and adjusting the compensator until the total sound heard is as loud as possible. Theoretically this will occur when there has been provided in the compensator a difference of path equal to the path difference outside the receivers. The method has not proved very successful, for a variety of reasons, some of which are obscure. We shall not elaborate them here.

On the other hand, remarkable results have been obtained by the application to sound waves of a phenomenon well known in the diffraction of light. A small distant source of light gives in the middle of the shadow of a small circular obstacle a luminous region, called the "white spot," arising from the diffraction of light round the edges of the obstacle. The same phenomenon is observable in sound under suitable conditions. Thus a large horizontal disc, at least 20 ft. in diameter, and made of material which either reflects or absorbs sound, will give below itself a sound shadow of a sound source, such as an aeroplane, above it. Near the centre of the shadow, in a position depending on that of the source, there is a region where the sound heard is comparatively loud—in many cases much louder than it would be if the disc were absent. The relation between the direction of incidence of the sound and the position of maximum intensity has been calculated, and the method provides, perhaps, the most reliable means of perceiving the direction of air-borne sounds.

(d) *Sound Ranging.*—This special military aspect of the localization of sound sources, viz. those arising from gun-fire and shell bursts, is dealt with in the article RANGE-FINDERS.

## 2. DETECTION AND PERCEPTION OF DIRECTION OF SOUNDS IN WATER<sup>1</sup>

Of all the methods practised for the detection of submarines that depending on the sounds which they emit has been of the widest application. The question of detection has been, of course, of nearly equal importance in the opposite sense, viz. the hearing of surface ships by the crew of a submerged submarine. The sounds created in the sea by a screw-propelled ship are of a very complicated character, arising partly from the interaction between the propeller and the water, and partly from the vibrations of the machinery which are transmitted through the walls of the ship into the sea. They vary greatly from ship to ship, even of the same class; and, in the later stages of the war, submarines had been constructed which, when cruising submerged at certain slow speeds, emitted practically no noise at all. In many ways the detection of submarines in the sea is more difficult than that of aircraft in air. Normally, listening in air takes place at stations which are fixed; in submarine listening the stations were most frequently ships, which for tactical reasons connected with their safety, had to be constantly on the move. Their own machinery noise and the acoustic disturbances arising from their motion through the water were very

apt to drown the noises proceeding from more distant sources. The noise of the sea, too, even in weather not at all stormy, interfered greatly, and the range at which a submarine could be heard varied much from day to day. A serious additional limitation was that recourse could not normally be had to the reflection of ordinary sounds (as is possible in air) chiefly by reason of the great size of the necessary reflectors. For the speed of sound in sea water is more than four times that in air, so that the wave-lengths are larger in the same ratio. This necessitates a corresponding increase in the linear dimensions of the sound mirror, if equal efficiency is to be obtained.

*Hydrophones.*—Hydrophones, or under-water sound detectors, were already in use before the war for signalling purposes, being carried by ships for listening to submarine bells operated by Trinity House as warnings in foggy weather. They consisted of small, metal, water-tight cases of which one face was a metallic diaphragm operating an enclosed microphone. The electrical disturbances of the microphone caused by any vibration of the diaphragm arising from sound pressure waves in the sea, were conveyed to telephone receivers on the ship, where listening took place. It was usual to suspend the hydrophones in water-filled tanks attached inboard to the outer shell of the ship, which, owing to the fact that steel in water transmits sound almost completely, does not diminish appreciably the intensity. Normally the hydrophone diaphragm was tuned so that its natural frequency in water<sup>2</sup> approximated to that of the signalling bell, and so that increased range could be secured by depending on resonance.

The earlier hydrophones used for naval purposes were of much the same type, although the resonant diaphragm proved to be by no means an unmixed advantage. All sounds containing a component corresponding to the diaphragm frequency were distorted in reproduction, and what was gained in sensitivity was liable to be lost in the difficulty of recognition, or, in other words, failure in discrimination between genuine noises due to a submarine and other noises inevitably present in the sea. Appeal to resonance is only really advantageous when the sound under observation has a predominant note, as in the case of an aeroplane; and submarines do not display this characteristic. Ultimately hydrophones of a non-resonant character came to be preferred, and were frequently used in practice. These consisted most usually of enclosures made of rubber, sufficiently thick to withstand the pressure of the sea at the usual depth (about 15 ft.), and having natural frequencies below the limit of audition.

An alternative type of hydrophone consisted merely of a hollow enclosure without a microphone, sometimes with a metallic diaphragm, and sometimes simply a rubber tube, filled with air and connected by long tubes to stethoscopes applied to the ears. These are operated by the transference of the pressure vibrations from the sea to the air cavity and thence to the ears. Electrical hydrophones have the advantage over non-electrical ones that their sensitivity can be readily augmented by various means, e.g., by the use of thermionic amplifiers (see WIRELESS TELEGRAPHY).

In cases where the hydrophones had to be used by ships in motion, they were sometimes fitted into the hull of the ship; or themselves consisted of fish-shaped bodies towed at a considerable distance behind the ship. The former precaution, i.e. making the shape stream-like, aimed at diminishing the vibrations created by the passage of the hydrophone through the water; the latter had in view the partial elimination of the disturbances arising from noises in the towing ship. Even so, it frequently became necessary to stop the engines temporarily, and listen with the towed hydrophones while the momentum of the ship continued to carry it forward. This proved to be only feasible at comparatively slow speeds.

*Directional Hydrophones.*—All the hydrophones so far described are of a non-directional character, i.e. the intensity of the sound heard in them is practically independent of the orientation of the sensitive receiving diaphragm with respect to the position of the source of sound. The limitations of dimensions necessitated by considerations of portability, etc., are such as to render the instruments much too small to give an effective "sound shadow." The reason for this has already been mentioned, viz. the great wave-lengths corresponding to audible sounds. At a frequency of 500 per second, for example, the wave-length in water is nearly ten feet.

*Differential Hydrophones.*—Curiously enough, however, one type of directional hydrophone, called here for distinguishing purposes a *differential* hydrophone, did, in fact, depend upon the small differences of pressure operating upon its two sides; and it met with considerable success. It was made in various forms, the simplest of which consisted of a circular metal diaphragm, bearing at its centre a water-tight box containing a microphone, and clamped round its rim to a heavy metal ring. When placed in the sea so that the plane of the diaphragm passed through the position of the sound source, the pressure variations on the two sides are the same both in amplitude and phase, with the result that the diaphragm and therefore

<sup>1</sup> The following publications should be consulted, although, for reasons already given, they form by no means adequate references:—H. C. Hayes, *Engineer* (1920), p. 491; C. V. Drysdale (Kelvin Lecture), *Journ. I.E.E.* (1920); W. H. Bragg, "Submarine Acoustics," *Nature*, July 1919; F. L. Hopwood, "Submarine Acoustics," *Nature*, Aug. 1919.

<sup>2</sup> This is considerably lower than the natural frequency in air, on account of the additional loading by the water.

the microphone, has no motion imparted to it, and the sound heard is a minimum. If, however, the diaphragm faces the sound source, there are, apparently, differences in the pressures on the two sides (probably in both amplitude and phase), and a small differential vibration takes place, with consequent sound in the receiving telephones. Actually, as the hydrophone is rotated through  $360^\circ$  about a vertical axis, two maxima and two minima of sound intensity are observed. In this form, therefore, the instrument is what is called *bi-directional*, i.e. it is unable to distinguish between sources in *front* and *behind*. The desirability of obtaining a *uni-directional* instrument led to the introduction of the so-called *baffle-plate*, the behaviour of which has not yet been explained satisfactorily in terms of orthodox theory. The essential characteristics of a baffle appear to be that it should be made of non-resonant material and have air cavities within it. Such a plate, fixed at a small distance (which has to be determined by trial) from the face of a bi-directional hydrophone, transforms it into a uni-directional instrument. A single sound maximum is now obtained upon rotation, occurring when the sound source and the baffle plate are on opposite sides of the diaphragm; and a single minimum,—this when the baffle lies between the sound source and the diaphragm. The “edge-on” minima, observed when the baffle is absent, now disappear.

**Binaural Listening.**—The principles underlying this method of direction-finding have been described already. In the present case the main difference is that the sound receivers have to be submerged hydrophones. It has been found to be equally necessary for success that these should be as completely as possible non-resonant. The simplest arrangement used in practice was two rubber cavities placed several feet apart horizontally, and joined by separate equal tubes to the two ears. The device could be rotated about a vertical axis, usually passing through the hull of the operating ship. As in the case of air listening, compensators were often used in order to avoid the necessity of rotating heavy apparatus. An arrangement much preferred was to tow two or more fish-shaped hydrophones in known positions (about 12 ft. apart) behind the ship. Here electrical transference of the acoustic disturbances had to be adopted, and this necessitated great care in the choice of the microphones and telephone receivers so as to avoid selective resonance. (The behaviour of microphones in this respect was often unsatisfactory, and telephone earpieces, or magnetophones, were frequently substituted for them. This results in diminished sensitivity, but the binaural effects are much improved.) The telephone receivers delivered the sound into the compensator, and the phase difference was measured in the usual way; allowing, of course, for the difference of speed of sound in the sea and in the air channels of the compensator. In using a compensator with two sound-receiving units only, there remains an ambiguity of estimated direction, i.e. one cannot distinguish between the angles  $\theta$  and  $\pi + \theta$ . The introduction of a third unit, so that the three form a triangle of known dimensions,—the units being capable of use in pairs with the compensator—ensures the correct choice between the alternative angles.

**Other Methods of Direction-finding.**—Several other methods of perception of direction, not easy to classify, have found application in practice. One of these consisted in fitting in the shell of a ship, on opposite sides, two diaphragms with microphones attached, arranged so that the hydrophones thus formed were of as nearly as possible equal sensitivity. These were listened to alternately by means of a reversing switch. The ship, on account of its considerable size, was capable of giving a marked sound shadow. Thus the starboard hydrophone would give greater response than that on the port side if the sound source were to starboard, and vice versa. By steering the ship so that the responses were equal, it could be inferred that the course was directed towards the cause of the sound. The limitations of the method were mainly those arising from local noises; and the speed had to be small while listening took place.

In other cases large numbers of sound receivers, usually simple diaphragms whose function was to transfer the vibrations from the sea to the air inside, were inserted in the ship's hull. Good results were obtained by an arrangement of this kind, called the Walsley gear, in which the sound receivers were disposed at regular intervals on a large bulge, in the shape of a spherical segment, incorporated in the hull on either side towards the bows. The system acted as a sound lens, a sound focus occurring at a point where the “sound paths” by alternative routes were equal. Application of the laws of geometrical optics enabled the relation between the position of the focus and the direction of incidence of the sound wave on the ship's side to be determined.

**Sea Sound-Ranging.**—The methods hitherto mentioned for perceiving sound direction would all fail when the sounds are abrupt in character, because they all require an appreciable time for carrying out the necessary tests. To determine the position of an exploding submarine mine or torpedo we require, therefore, a different device. A suitable method is one identical in principle with that practised on land. The main variations in applying the device to the sea are that the microphones must be in submerged hydrophones, and that a correct knowledge of the velocity of sound in sea water must form the basis of the calculations. Ordinary non-directional hydrophones of the type first mentioned have proved to be quite sufficiently sensitive. Indeed, the greatness of the distances at which explosions in the sea have given unmistakable im-

pressions on the recording film has been surprising. Small detonators serve at distances of several miles, while the explosion of 40 lb. of gun-cotton is operative more than 100 m. from the receiving hydrophones. Many experiments have been carried out by the British Admiralty with hydrophones disposed in suitable positions on the East coast of Britain, and the installations promise to be useful, not only for locating mine and torpedo explosions in circumstances of war, but also for navigational and surveying purposes. A ship in fog, for example, could ascertain its position by exploding (with due notification by wireless to the sound-ranging station) a small charge near itself in the sea; the station could within a few minutes inform the ship—again by wireless—of its position.

Sea sound-ranging has necessitated the accurate redetermination of the velocity of sound in sea water. This has been accomplished by the inverse of the process just mentioned, viz. by exploding charges in the sea, and measuring by the recording string galvanometer the time intervals between the reception of the first shock by hydrophones submerged in accurately known positions. The observed velocity depends on several factors, including tidal flow, temperature, and salinity, which vary from place to place. The following table gives some of the results obtained, corrected to a standard salinity corresponding to a specific gravity of 1.026 and a temperature of  $10^\circ\text{C}$ .:—

Date	Place	Corrected Velocity in ft. per sec.
16. 5. 18.	Dover	4,882
6. 11. 18.	“	4,921
18. 7. 18.	“	4,924
26. 7. 17.	Culver (I. of W.)	4,962

The effect of tide, apparently, has not been allowed for. It would amount, at most, to a few feet per second.

### 3. AUDITORIUM ACOUSTICS

The acoustics of public buildings have recently been put on what approximates to an exact scientific basis, largely as a result of the work of W. C. Sabine (*Frank. Inst. J.*, 179, p. 1, 1915). For good hearing three conditions are necessary and sufficient. The sound heard must be *loud enough*; the simultaneous constituents of a mixed sound must preserve their *relative intensities*; and the successive sounds must *remain distinct and in the correct order*, and be free from extraneous noises. The extent to which these conditions are fulfilled depends on the construction of the auditorium, its shape, its dimensions, and the materials of which it is composed. In already finished buildings radical alterations of the first two are not often feasible, but great improvements can be secured solely by suitable changes in the internal features.

The main difficulty arises from what has been called *reverberation*, due to the multiple reflection of sound at different parts of the room. If the reverberation is prolonged, it means that the rate of absorption of the sound is slow. Thus, in a lecture room at Harvard, where these experiments were commenced, the rate of absorption was so small that a single spoken word continued to be audible for  $\frac{5}{2}$  seconds. Successive syllables thus had to be heard and appreciated through a loud mixed sound due to the reverberation of many previous syllables, and the conditions of hearing were intolerable. Great reduction of the multiple echoes constituting reverberation can be made by increasing the rate of absorption of sound. It is apparent that, in the space of several seconds, the sounds travelling at 1,100 ft. per sec. will have suffered many successive reflections, and will, therefore, have penetrated to practically all parts of the room. The sound will have become diffuse radiation, and absorbing material introduced almost anywhere will be equally effective in reducing reverberation. An open window proves to be a complete absorber, in the sense that it permits the egress of the maximum possible quantity of sound radiation (*cf.* the properties of a small aperture in an isothermal enclosure in heat radiation). The introduction of cushions, carpets, wall hangings and people also largely diminishes reverberation, because of their considerable absorbing powers. Sabine has made a systematic study of the coefficients of sound absorption of various materials by the inverse method of measuring their effect in reducing the duration of reverberation. Typical results are given in the following table. These apply to the frequency an octave above middle C.

Material	Coefficient of Absorption
Open window	1.000
Linoleum, loose on floor	0.12
Oriental rugs	0.29
Plaster on wood lath	0.034
Glass, single thickness	0.027
Plain ash chairs	0.008
Upholstered chairs	0.30
Hair felt, 2.5 cm. thick, 8 cm. from wall	0.75

Other measurements indicated that an audience gave an absorption equal to 44% of that due to an equal area of complete absorber, thus accounting for the improved hearing conditions known to exist in well-filled buildings.

The absorption of sound can thus be adjusted with precision, but it must not be carried too far, otherwise the sound intensity is too much diminished. The ear is able to disregard, or even to take advantage of, reverberation which is not too prolonged, and the extent of absorption has to be adjusted to the appropriate amount. Too many apertures such as open windows or doors must be avoided.

Sabine has also made examination of the exact manner in which sound is reflected in an auditorium by constructing scale models of the latter, and photographing the sound waves at various instants after creation, using the beautiful method due to Toepler (*Annalen der Physik*, 127, p. 556) and elaborated by R. W. Wood (*Physical Optics*, 2 ed., 1911, p. 94). By this means the positions of the sound waves, both incident and reflected, are capable of observation at all instants and at all points in the model room, and they provide data upon which can be based correct architectural construction from the acoustic point of view.

#### 4. MISCELLANEOUS ADVANCES

**Absolute Measurement of Sound.**—A. G. Webster (*Nat. Acad. Sci. Proc.*, 5, p. 173, 1919) has advanced to a considerable extent the methods of absolute measurement. For this purpose it is impossible to rely upon audition, handicapped as it is by the vagaries of the ear. What is required is a reliable mechanical device, the performance of which is constant, to record the sound vibrations with sufficient magnification. Webster has made an exhaustive study of the properties of various materials, and has constructed from those most suitable for the purpose two instruments which he has called the *phone* and *phonometer* respectively. The phone provides a means of creating a simple tone of intensity and frequency which are under control and capable of exact measurement. The phonometer is an instrument for measuring absolutely the vibrations received by it. It consists of the combination of a diaphragm and a resonator, both of which are adjustable in frequency. The motion of the diaphragm is observed by making it a reflector and part of a Michelson interferometer, so that the amplitude is measured in terms of the wave-length of suitable monochromatic light. In practice the interference fringes are photographed on a moving film upon which they appear as wavy lines. Against this instrument, which is regarded as a standard, other portable phonometers can be calibrated, these depending on the simpler process of the deflection of a beam of light set into angular oscillation by the receiving diaphragm. With such instruments, and also with D. C. Miller's *phonodeik* (referred to later) L. V. King has carried out an elaborate investigation on the propagation of sound in air and fog-signal efficiency (*Phil. Trans.*, 218, p. 211, 1919) in the region near Father Point, Quebec. King, in this paper, also describes a modification of the siren called the *diaphone*, used as a standard source of sound in his research.

**Analysis of Sound.**—Webster's phonometer described above is a resonant instrument, and, therefore, unsuitable for the analysis of mixed sounds. Much progress has been made, however, in the analysis of such sounds, using non-resonant recorders, for example, D. C. Miller's *phonodeik*. This instrument, which depends on the motion imparted to a tiny mirror by the opera-

tion of a vibrating diaphragm, is described in Miller's *Science of Musical Sounds* (1916), where also will be found the results of the analysis of various sounds. Similar work has been carried out by C. V. Raman, in relation to the vibrations of bowed strings and instruments of the violin family (*Indian Assoc. for Cultivation of Science*, Bull. No. 15, 1918). In these cases the sound record is of the ordinary type and consists of the trace on a moving photographic film of a spot of light vibrating at right angles to the motion of the film, thus forming a transverse wave. Records of a different type have recently been obtained (A. O. Rankine, *Proc. Phys. Soc. Lond.*, 32, p. 78, 1919) in which the sounds are caused to vary the intensity of a narrow beam of light, which gives on a moving film a line image perpendicular to the motion. The record thus consists of a negative film of varying transparency along its length. It is not so suitable as transverse records for direct analysis of the component frequencies, but it has the advantage that it admits of reproduction of the sound by means of a selenium cell, such as is used in photography. This arrangement constitutes a novel type of phonograph operated by light, first invented by Ernst Ruhmer in 1900, but hitherto little known. (A. O. R.)

**SOUTH AFRICA** (see 25.463).—On the conquest of German S.W. Africa by the Union forces in 1915 the whole of S. Africa, except for the Portuguese possessions S. of the Zambezi came under British administration. Excluding the Portuguese territory (for which see DELAGOA BAY and PORTUGUESE EAST AFRICA), S. Africa was in 1921 divided politically as follows:—

1. The Union of S. Africa, a self-governing dominion of the British Empire formed in 1910 and consisting of the former colonies of the Cape, Natal, Orange River (Free State) and Transvaal.

2. The S.W. Protectorate (ex-German S.W. Africa), administered under mandate as an integral part of the Union.

3. The native protectorates of Basutoland, Bechuanaland and Swaziland, administered by the British Colonial Office.

4. Rhodesia, consisting of two separate administrations, S. Rhodesia and N. Rhodesia; both under the rule of the British S.A. Company.

**Area and Population.**—Including both Rhodesias the area of S. Africa is approximately 1,650,000 sq.m., of which some 125,000 sq.m. are Portuguese. The total pop. in 1921 was little over 11,000,000, of whom some 700,000 lived in Portuguese territory.

The following table shows the white population in the Union and in Rhodesia at the censuses of 1911, 1918 and 1921:—

	1911	1918	1921
Union of S. Africa	1,276,242	1,421,781	1,521,635
S. Rhodesia	23,606	..	33,621
N. Rhodesia	1,497	..	3,585
Total	1,301,345	1,421,781	1,558,841

The increase per cent. in the Union in the period 1911–21 was 19.23, masculinity (the number of males to 100 females) decreased from 115.92 to 106.14.

The next table gives particulars of area and pop. of British South Africa at the 1911 census:—

	Area Sq. m.	Pop. 1911 White	Native and Coloured	Total
Union of S. Africa:				
Cape Province	276,995	582,377	1,982,588	2,564,965
Transvaal Province	111,196	420,562	1,265,650	1,686,212
Natal Province (includes Zululand)	35,371	98,114	1,095,929	1,194,043
Orange Free State Province	50,392	175,189	352,985	528,174
Total Union	473,954	1,276,242	4,697,152	5,973,394
Territories:				
S. Rhodesia	148,575	23,606	747,471	771,077
N. Rhodesia	290,000	1,497	821,102	822,599
Total Rhodesia	438,575	25,103	1,568,573	1,593,676
Protectorates:				
Bechuanaland	275,000	1,692	123,658	125,350
Basutoland	10,293	1,411	402,434	403,845
Swaziland	6,536	1,083	98,876	99,959
Total Protectorates	291,829	4,186	624,968	629,154
Total British S. A.	1,204,358	1,305,531	6,890,693	8,196,224

Compared with the census of 1904 the increase in the white pop. was 172,390. Of this increase 123,285 was in the Transvaal. In Rhodesia the white pop. had nearly doubled in the seven years. The increase in the native and coloured pop. was 885,660. With respect to the coloured pop. two important factors must be remembered. (1) The Cape province total of native and coloured includes 391,000 persons with a marked strain of white blood, officially classed as "mixed"; the total "mixed" pop. being 435,000. (2) The Natal province total of native and coloured includes 133,000 Indians. There were also 10,048 Indians in the Transvaal, the total Asiatic pop. being 152,000.

The following table gives particulars of the white pop. of the Union by provinces at the censuses of 1911, 1918 and 1921:—

	1911		1918		1921	
	Males	Fe-males	Males	Fe-males	Males	Fe-males
Cape						
Province .	301,268	281,109	311,312	307,513	329,934	321,620
Natal .	52,495	45,619	62,745	59,186	70,624	66,834
Transvaal .	236,913	183,649	260,840	238,507	284,952	258,529
O. F. S. .	94,488	80,701	93,969	87,709	97,971	91,171
Total, Union	685,164	591,078	728,866	692,915	783,481	738,154

The coloured pop. of the Union in 1921 was in round figures 6,000,000, that of S. Rhodesia 744,000 and of N. Rhodesia about 1,000,000, that of the native protectorates 750,000, that of S.W. Africa 240,000, or a total of about 8,750,000.

There were in 1918 five towns with a white pop. of over 20,000 and eight towns with a white pop. between 10,000 and 20,000. The following list of the five chief towns gives the total pop. at the 1911 census with the white pop. in 1918 in brackets:—Johannesburg 237,104 (137,166), Cape Town 161,759 (99,683), Durban 89,998 (48,413), Pretoria 57,674 (41,690), Port Elizabeth 37,063 (23,339). Outside the Union the only considerable towns in S. Africa were Bulawayo and Salisbury in Rhodesia, Swakopmund and Windhuk in the S.W. Protectorate and Lourenço Marques (Delagoa Bay) and Beira in Portuguese territory.

#### THE UNION OF SOUTH AFRICA

The Union of S. Africa came into being on May 31 1910. Minor amendments were made in the constitution during the next ten years, but its main features (see 25,467) remained unaltered. In accordance with the electoral provisions—the basis of representation being the number of European male adults as ascertained by census taken every fifth year—the Transvaal province obtained nine additional seats in 1915, and four more seats were added in 1920. The seats allotted in 1920 were Cape 51, Transvaal 49, Natal and Orange Free State 17 each.

No alteration was made in the franchise laws. In the Cape province in 1919 out of a total of 186,000 voters, 33,000 were "other than European." In Natal the voters numbered 32,000, of whom 348 were "other than European." In the Transvaal (140,000 voters) and Orange Free State (47,000 voters), "Europeans" only, possess the franchise.

**Agriculture.**—The progress made in agriculture (including pastoral occupations) was in many respects the most encouraging feature in the economic development of S. Africa between 1910-21. The establishment in the Transvaal during the period of Crown Colony Government, of an agricultural department on scientific lines had given an impetus to the adoption of modern methods by the farmers, and the fusion, at the Union, of the agricultural departments of the four former colonies led to greater improvements. By withdrawing the control of agriculture from the provinces the Union Government was able to coördinate the work and to disregard artificial boundaries. Much of the progress was due to Gen. Botha "who with his instinct for things that really mattered" had held the portfolio of agriculture together with the premiership of the Transvaal, and in the Union was also for a considerable period minister of Agriculture as well as prime minister. General Botha gave full encouragement to the technical and scientific staff. Schools of agriculture—there were five in 1921—and experimental stations were established on large farms situated on main railway lines. A two years' course of instruction was provided as well as shorter courses and up to 1920 some 5,000 students had passed through the schools. Of the 300 experts in the department in 1921, over one-third were ex-students. Up to that year £1,000,000 had been spent on buildings and equipment.

The veterinary service did invaluable work in investigating the diseases of stock, discovering the causes of East Coast fever, and other diseases, some of which were eradicated. Its work rendered possible the keeping of animals in many districts where it had not previously been possible, and made profitable the importation of high-class live stock. In 1920 it was estimated that the value of the live stock in the country, chiefly cattle and sheep, was over £100,

000,000. The entomological and botanical divisions were also active, one notable achievement being the ridding—at least temporarily—of the country from locust plagues. This was done by tracking the locusts to their breeding places and as soon as the young were hatched (when they crawl, but do not fly) sprinkling them, and the surrounding veld, with a mixture of arsenic and molasses, a plan devised by a Natal farmer. This method proved so effective that in 1918-20 no swarms of locusts were reported in the Union.

New crops and plants were introduced, among them *leff grass* from Abyssinia, very valuable for hay, which in 1920 was grown on 234,000 acres. The general result of the Agricultural Department's work, backed by the rise in prices during the World War, was to make S. Africa almost self-supporting as regards food-stuffs, while in 1919 agricultural and pastoral exports were valued at £33,000,000, and in 1920, a year of depression—especially in the ostrich feathers trade—at £27,000,000. In the back-veld farming had been "transformed from what was little more than nomadic grazing to an organized industry and throughout had been placed on a higher plane."<sup>1</sup>

Of pastoral industries the breeding of woolled sheep is the oldest and most important. The number of woolled sheep in the Union was 21,842,000 in 1911, 26,490,000 in 1916 and 23,548,000 in 1919. The number of other sheep, 8,814,000 in 1911 had, however, declined to 4,943,000 in 1919. These figures did not include sheep in native locations, which in 1919 numbered about 2,250,000. The wool exported from the Union reached 176,971,000 lb. in 1913 and was 115,634,000 lb. in 1918. The World War sent up prices, the average price per lb. in 1913-4 being 7-95d. and in 1917-8 20-78d. In 1918-9 when the average price was 20-08d. the value of the wool exported was £14,648,000. Wool worth £5,678,000 went to the United Kingdom, £5,209,000 to the United States and £2,786,000 to Japan. France and Canada were the next largest customers. There is also a considerable trade in sheepskins; the value of the skins exported was £594,000 in 1911 and £1,329,000 in 1918.

South Africa produces more than half the world's supply of mohair. The Angora goats in the Union in 1918 numbered 5,278,000, mohair exported that year was 10,645,000 lb., valued at £1,641,000. The trade in mohair is subject to wide variations, and the limit of production in S. Africa is that of successful competition with Turkey for the supply of the Bradford market. In 1920 the value of mohair exported fell below £500,000, chiefly owing to lessened demand for yarn from Bradford by Poland and Germany.

The number of cattle in the Union rose from 5,796,000 in 1911 to 7,255,000 in 1919. The steady progress of the cattle industry is seen in the figures of imports and exports of meat.<sup>2</sup> Up to and including 1913 imports greatly exceeded exports. Thus in 1913 the quantity of meat imported was over 11,000,000 lb., and that exported but 1,387,000 lb. In 1917 the imports had fallen to 23,000 lb., while the exports had leapt to 47,250,000 lb. (valued at £1,043,000). This was an exceptional war-time condition, but in 1919 while there were no imports the exports reached 44,408,000 lb. In 1916, for the first time, sufficient butter and cheese were made in the Union for all local requirements and something left over for export. The total export of butter in 1918 was 1,316,000 lb., of cheese 424,000 lb. In 1919 butter exports fell to 452,000 lb., but that of cheese increased to 1,546,000 pounds.

Large areas of S. Africa are well adapted to horse-breeding; in general, horses do well wherever conditions are best suited for sheep. The numbers of horses in the Union in 1919 was 695,000, of mules 81,000, of asses 498,000. These figures do not include horses, etc., in native locations.

Ostrich-farming suffered severely through the World War. In 1913 the industry had attained unprecedented success, when feathers weighing 1,023,000 lb. valued at £2,953,000 (an average value of £2 17s. 9d. per lb.) were exported. In that year there were 776,000 ostriches in the Union (757,000 in the Cape province). Over-production and the effects of the war in five years brought about an almost total collapse of the feather trade; the export fell by three-fourths and prices to 15s. a lb. Many breeders took up other branches of farming and by 1920 few persons were wholly dependent on ostriches for their living. The stock of birds was greatly reduced (it was 314,000 in 1918), only those of finest plumage being retained.

The pig and bacon industry is a development wholly post-Union. Pedigree animals were imported but the industry had barely got beyond infancy in 1920. The total production of bacon in the Union in 1917-8 was slightly over 7,000,000 pounds.

Among cereals the most important crop is maize. The maize belt covers a large area in the eastern portion of the Union, chiefly in the Transvaal and Orange Free State. There is an expanding home market for maize and an assured overseas market. The quantity of maize exported was 356,000,000 lb. in 1910 valued at £693,000 and 509,000,000 lb. in 1918, valued at £1,600,000. Kafir corn, grown chiefly by natives, specially valuable for fodder in

<sup>1</sup> Consult a paper on S.A. Agriculture by F. B. Smith, sometime secretary of the S.A. Agricultural Department, read at a meeting of the Colonial Institute, May 31 1921.

<sup>2</sup> The figures relate to beef and mutton but the quantity of mutton exported is small, 62,000 lb. in 1910 and 46,000 lb. in 1919.

regions too dry for maize, was also an increasingly valuable crop. The area under wheat is mainly in the western part of Cape province; the production, 362,000,000 lb. in 1911, rose to 608,000,000 lb. in 1917-8, but fell the next year to 478,000,000 lb. Of oats 48,454,000 lb. were exported in 1919.

Sugar plantations are confined to Natal and Zululand. The area under sugar in 1916-7 was 163,000 ac., the production that year being 114,000 tons and the value £3,134,000. In 1919-20 the output was approximately 180,000 tons, of which over 30,000 tons were exported. The cultivation of tea declined, sugar yielding greater profits; the yield for 1916-7 was 1,747,000 lb., compared with 2,681,000 in 1903, the year of highest production. Tobacco production did not show great variation in quantity during 1910-20, the yield being 15,000,000 to 17,000,000 lb. yearly, but there was considerable alteration in the class of tobacco grown, due to the increased demand for light and medium varieties. Cigarettes from locally grown Turkish tobacco became very popular.

Fruits of many varieties are produced for which there is a very large home demand, especially in the mining areas. The export trade, in fresh, bottled, canned and dried fruit and in jams showed a fair amount of extension and in 1919 was valued at £125,000.

Plantations of black wattle for the production of tan-bark cover about 250,000 ac., of which 160,000 are in Natal. Before the World War the bark was taken by Germany; factories for the production of the extract were erected in Natal in 1919 and the extract sent to Great Britain. The value of the exports increased from £269,000 in 1916 to £412,000 in 1918.

**Irrigation.**—Considerable progress was made in local irrigation schemes, but no great project had been undertaken by the Union Government up to 1922. The opposition of vested interests stood in the way of an adequate water law for the whole country, but in 1912 an Irrigation and Conservation of Waters Act was passed and an Irrigation Department created. Provision was made for irrigation loans to private persons and to irrigation boards, and for hydrographic surveys, etc. The government expenditure on irrigation increased from £276,000 in 1912-3 to £573,000 in 1917-8. By 1920 schemes involving an expenditure of £2,500,000 had been approved. The Sunday river, Cape province, irrigation works were the largest then under construction and were designed to bring 42,000 ac. under cultivation.

**Mining.**—Despite appearances the most valuable mineral in S. Africa is coal. The position was put succinctly in 1920 by Mr. U. P. Swinburne, Chief Inspector of Mines, when he wrote in the *Official Year Book of the Union* "S. Africa has made its name through the production of gold and diamonds, but it is mainly due to the existence of cheap coal that the large output of gold and diamonds has been made possible. On the Witwatersrand proper only a few mines would be working at the present time if a plentiful supply of cheap steam coal was not available." Opinions of experts on the life of the gold mines on the Rand differ; the report of the Union Economic Commission, presented early in 1914, estimated that 550,000 tons of payable ore remained in the mines then working. This figure was very much less than had been expected. Since that year new mines on the Far Eastern Rand have been developed. Mr. P. A. Wagner, in his presidential address in 1918 to the S.A. Association for the Advancement of Science, hazarded the conjecture that £1,200,000,000 worth of gold remained to be extracted and that 50 years ahead some of the mines might still be profitably worked. But gold production on the Rand is so costly that a slight rise in costs has on many mines a disastrous effect.

With regard to diamonds their abundance is unquestioned, and a policy of limiting supplies to keep up prices is adopted. Even so most of the diamond mines were shut down in 1920-1, a striking example of the economic depression prevailing, S.A. being the only considerable source of the supply of diamonds in the world. Depression in prices led also in 1918 to the closing of the copper mines in Namaqualand, Cape province.

Since 1912 the gold industry has become increasingly dependent on the development of the Far East Rand. Thus in 1918 the dividends paid from the Far East Rand mines amounted to £3,344,000, compared with £1,929,000 from all other Rand mines. The value in sterling of the gold output from the Transvaal mines rose from £31,973,000 in 1910 to £39,489,000 in 1916. This was considered the high water mark.<sup>1</sup> The value in 1917 was £38,306,000, in 1918 £35,758,000, in 1919 £38,389,000 and in 1920 £34,652,000 (for the first half of 1921 the output was £16,671,000).

The statistics of the output of diamonds reflect the purchasing power of the public. The market is strictly controlled by the producers and the only diamond field of importance which was outside the Union—that of ex-German S.W. Africa—as a result of the World War came into line with the other S.A. mines. In 1914, shortly before the war began, a conference of representatives of the diamond industry was held in London with the object of regulating the output from each mine. Though no binding agreement was then made such an arrangement is virtually in force. The value of the

diamonds extracted in 1910 was £8,746,000, in 1913, the last full year before the war, £11,389,000. In 1915 diamond mining almost ceased, the total output that year being valued at £399,000. The mines restarted in 1916, when the value of the output was £5,728,000. In 1918 the figure was £7,114,000 and in 1919 had risen to £11,734,000, thus exceeding the record of 1913. The year 1920 began well and ended badly; the market was overstocked and purchasers few. The overstocking of the market was attributed by the De Beers Co. to the sale of diamonds by the Russians—by the Soviet Government to obtain goods and by private individuals who had lost other means of subsistence. The Rhodesian output of diamonds is very small; the De Beers Co. has the right to dispose of all diamonds found in the territory. In the Premier mine, Transvaal, the system of open working still prevailed in 1921. In Sept. 1917 a fine stone of 442 carats was found in the Dutotsapan mine, Kimberley.

A very marked development of coal mining took place between 1910 and 1921. The mines of the Cape province, which yield only poor quality coal, were nearly all abandoned as the richer deposits in Natal and the Transvaal were opened up. The output from the Cape exceeded 100,000 tons for the last time in 1909, in which year the Natal fields first yielded over 200,000 tons. The total output from the Union rose from 7,112,000 tons valued at £1,869,000 in 1910 to 10,382,000 tons valued at £3,275,000 in 1917 and was 10,266,000 tons in 1919. Besides supplying cheap fuel for the gold and diamond mines and other purposes, the coal is in great demand for bunkering ships and for export to India, E. Africa and S.A. ports. In 1919 Union coal bunkered was 1,427,000 tons; coal exported 1,092,000 tons (half of these exports going via Delagoa Bay).

The output of tin, mined almost entirely in the Waterberg and Olifants river districts, Transvaal (3,672 tons in 1913 valued at £436,000), had dropped in 1918 to 1,900 tons valued at £277,000.

Copper output increased with the opening of the railway in 1913 to the Messina mines on the Limpopo. These with the Namaqualand mines represented the copper output of the Union, which in 1916 with 22,800 tons reached a value of £1,137,000. In 1919 the output sunk to 4,900 tons valued at £208,000.

**Trade and Shipping.**—The following table gives the total of imports and exports to and from the Union for 1911, the first complete year after the Union had been established, for 1915, the year of the greatest restrictions of trade owing to war conditions, and for 1919. The exports include diamonds and gold, the imports government stores and specie:—

Year	Imports	Exports	Total Trade
1911	£38,035,000	£57,308,000	£95,343,000
1915	£33,833,000	£35,012,000	£68,845,000
1919	£50,791,000	£104,561,000	£155,352,000

Trade in 1920 was conditioned by the world depression, which did not become marked till the second half of the year. Imports in the first six months showed a large increase, being £48,000,000 against £28,000,000 in the corresponding period of 1919, and for the whole year exceeded £90,000,000. Exports for the first six months of 1920 showed a comparatively small decline, being £51,000,000 as against £58,000,000 for Jan.-June 1919, but for the whole of 1920 the total was only £72,000,000.

The distribution of trade by countries was as follows in 1910 and 1919.—Imports (1910) United Kingdom 59%, (1919) 46%; other British lands (1910) 11%, (1919) 17%; United States (1910) 8%, (1919) 24%; other countries (1910) 22%, (1919) 13%. Exports (excluding gold) United Kingdom (1910) 80%, (1919) 61%; other British lands (1910) 1%, (1919) 8%; United States (1910) 17%, (1919) 24%; other countries (1910) 17%, (1919) 15%.

Nearly all the external trade of the Union passed through Durban, Cape Town, Port Elizabeth and East London. The only non-British port which had a share in the trade of the Union was Delagoa Bay. In 1913 Delagoa Bay had 12% of the trade, in 1918 only 8% (see DELAGOA BAY). Of neighbouring countries the chief trade was with Rhodesia, Portuguese E. Africa and the Belgian Congo. The exports to British E. Africa (Kenya Colony) increased from £19,000 in 1913 to £396,000 in 1918; in the same period the imports from British E. Africa rose from £16,000 to £139,000. Of foreign countries outside Africa and excluding the British Empire and the United States, France and the Argentine were the chief traders with the Union. As to overseas carrying trade the British proportion of cargo shipped in 1918 was 79.85% and the Japanese 7.51. Of cargo landed the British proportion was 69.17% the Japanese 10.12% and the American 9.43%.

The value of the preferential treatment accorded certain articles of merchandise imported into the Union from the United Kingdom, Canada, Australia and New Zealand is shown by the following figures:—In 1913 on imports valued at £22,498,000 the amount rebated was £628,000; in 1918 on merchandise worth £25,158,000 the rebate was £698,000.

The number and tonnage of vessels entered at Union ports (including the coastwise trade) was as follows in the years named. The figures represent the gross number of vessels using the Union ports, i.e. the same vessel, if it called and cleared at Cape Town, Port Elizabeth and Durban, would be entered three times. The tonnage

<sup>1</sup> The total value of gold mined in British S. Africa in 1916 was £43,416,047: of this total £38,859,111 came from Rhodesian mines, £31,726 from the Natal goldfields, £1,336 from Natal and £132 from Cape province. The Natal mines in 1915 had yielded over £10,000.

of vessels cleared is not given, it corresponds closely to the figures of tonnage entered.

Year	No. of vessels entered	Net tonnage British	Net tonnage Total
1913	4,349	10,586,000	12,939,000
1915	3,322	7,298,000	7,937,000
1917	3,888	7,682,000	9,252,000
1919	3,060	6,642,000	7,608,000

The number of German ships entering Union-ports in 1913 was 230, of 723,000 net tonnage.

**Communications.**—Nearly all the railways in the Union are state owned. Railways and harbours are under the control of a Board, whose finances are independent of the other revenue departments. The mileage of railways open in 1910 was 7,586, of which privately owned lines had a mileage of 545. In 1919 the mileage open was 10,049, of which government lines had 9,542 mileage. It will be seen that development was rather slow, an average of 246 m. a year in a period of 10 years. The total expenditure on new lines in these 10 years was £9,113,000. The principal new line, that from Prieska to Kalkfontein connecting the Cape and S.W. Protectorate systems, was built for military purposes. The extension in 1913 of the railway from Krugersdorp via Zeerust to Mafeking brought Johannesburg and Bulawayo within 680 m. of one another (instead of 975 m. via Fourteen Streams) and made Mafeking the business centre for the western Transvaal. The opening, also in 1903, of the Messina railway, afforded the opportunity, by the building of a connecting line to W. Nicholson in S. Rhodesia of putting Bulawayo in direct communication with Delagoa Bay. But, up to 1921, the needed link had not been built (*see RHODESIA*). In the Cape province the completion of the Mossel-Bay-George-Oudtshoorn line gave a much more direct connexion between Cape Town and Port Elizabeth reducing the distance from 910 m. (via de Aar) to 684 m. (the distance by sea between the two ports is 436 nautical miles). The adoption of electricity on a number of lines, including the main line from Durban to Glencoe was recommended in 1920 by the government's consulting engineer. The scheme was adopted by the ministry for the Cape Town-Simon's Bay line and for the Natal main line from Durban as far as Maritzburg. With the electrification of the Durban-Maritzburg line a new alignment was undertaken as part of a scheme for rebuilding the whole line from Durban to the Rand.

The Railways and Harbour Board after the World War took over control of the railways in the S.W. Protectorate. The total railway mileage in the Union and Protectorate at the beginning of 1920 was 11,334. Up to March 31 1920 the capital expenditure on Government railways was £66,408,000. The gross earnings in 1919-20 were £19,169,000 and working expenses 78.9% of the gross earnings.

The use of motor vehicles greatly increased from 1913 onwards (when over 4,000 cars were imported), farmers having by then learned their value. In 1919 over 16,000 vehicles were licensed. Nearly all the cars came from America (United States and Canada), but heavy motor lorries were imported from England. Notwithstanding this development of motor traction the trek ox was still employed though in decreased numbers.

The extension of the telegraph system kept fair pace with the needs of the community, and wireless stations were erected at Durban, Cape Town and (in 1921) at Port Elizabeth. These were not of high power, the guaranteed range (at night only) not exceeding 1,500 miles. Wireless telephonic stations were added in 1921.

With respect to the mail service to England no improvement in speed was made. A contract to run for 10 years from Oct. 1 1912 was entered into with the Union Castle Co. for a weekly service to and from Southampton, the duration of the voyage to be 16 days 15 hours. The subsidy paid was £171,000 yearly, of which £21,000 was in consideration of the mail steamers beginning and ending their voyages at Durban instead of Cape Town. The contracting parties were on the one hand the steamship company and on the other hand Great Britain, the Union, Southern Rhodesia and the Bechuanaland Protectorate. Postal communication with Australia, India and the Far East was maintained by private ships as opportunity offered. A steamship service between Holland and S. Africa, subsidized by the Netherlands Government, was established in 1920, and in 1921 a direct service between S. Africa and Vancouver was started by the Canadian Government. While some £10,000,000 or more a year was spent on harbour works except at Durban (*see DURBAN*) the facilities for shipping were not greatly extended, and Cape Town suffered from lack of adequate dock accommodation.

Air travel developed slowly. The first aeroplane flight was made in 1910 in a Voisin biplane. Little progress was made in civil aviation until after the World War, when, in 1919, aerodromes were laid out at Wynberg, Bloemfontein, Johannesburg and other places as stages on the cross-Africa route. The first flight from Cairo to Cape Town was made in 1920 by two S.A. military pilots. In the same year an Aero Club for S.A. was formed at Cape Town.

**Education.**—"Education, other than higher education," which definition in practice was held to include all education other than university, is controlled by the provincial councils. The standards and methods differ in each of the four provinces but in general provision is made for a sound training of white and coloured (as

distinct from native) children. A matter which aroused acute dissensions before and in the two years immediately following the establishment of the Union was the question of the medium of instruction. By law the English and Dutch languages were in a position of equality. An attempt to favour Dutch was made in the Transvaal schools, while in the Free State the education authorities tried to enforce bi-lingualism, insisting that English-speaking children should be taught in the medium of Dutch. Eventually all four provinces adopted the principle recommended by the Union Parliament in 1911, namely that the medium of instruction up to standard IV. should be in the "home" language of the scholar, and that above that standard freedom of choice should be left to the parents. The compromise worked and in June 1912 the private schools which had been opened by the English speaking residents in the Free State in 1910 as a protest against compulsory bi-lingualism were handed over to the provincial administration. The subject of religious instruction presented little difficulty. The practice in each province in all public schools is for school to be opened with prayer and a reading from the Bible. Scripture teaching, subject to a conscience clause, is generally provided; sectarian teaching under certain conditions is allowed in the Cape province by an ordinance passed in 1913. The number of schools in the Union for white children increased from 3,873 in 1910 to 4,846 in 1918; in the same period the schools for coloured children increased from 1,999 to 2,877. The number of white scholars in 1910 was 163,200, in 1918 the number was 283,700. The coloured scholars had increased in the same period from 136,000 to 220,100. The teachers had increased from 10,912 to 18,301, and the expenditure from government funds had grown from £1,597,000 to £3,631,000. Private schools were not numerous; there were 270 in the Union in 1918, of which 96, the oldest dating from 1880, were in the Cape province. There were then in the Union 135 private schools founded since 1910.

State and state-aided schools for natives are provided in all the provinces, and in Natal and the Transvaal there are special schools for Indians. The expenditure on native schools rose from £81,000 in 1911 to £137,000 in 1918. In Natal in 1918 the government established an institution for training the sons of chiefs and *indunas* in the special duties they are called upon to perform. The education of the natives remained, however, very largely in the hands of missionary societies, though there was a growing inclination, among the natives, particularly in the Transkeian territories, to secularize education and to obtain a larger direct share in its management. Of the 23 principal institutions which in 1919 provided higher education for natives—literary, commercial, industrial, agricultural and training for the ministry—12 were in Cape province, the largest and most comprehensive being the famous Lovedale College. The most important step in regard to higher education of natives was the establishment, in 1914, of the S.A. Native College on a site at Fort Hare, Cape province, given by the United Free Church of Scotland. To this college the natives and the missionary societies, Presbyterian, Anglican and Wesleyan, contributed; the Union Government gives an annual grant. The college aims at providing education of university standard and is open to coloured and Indian students.

The system of higher education was reorganized in 1918, after much heated controversy (*see below § History*). Under the new scheme the university of S. Africa, with headquarters at Pretoria, which replaced the university of the Cape of Good Hope, is an examining body, having the following constituent colleges:—Grey University College, Bloemfontein, Huguenot College (for women), Wellington, Natal University College, Pietermaritzburg, Rhodes University College, Grahamstown, South African School of Mines, Johannesburg, and Transvaal University College, Pretoria. The new university of Cape Town provides for the residence as well as the teaching of students (men and women). A special feature of the new Stellenbosch University is its agricultural faculty (the Transvaal University College has also an agricultural faculty). The number of university students in the Union increased from 1,171 in 1910 to 2,069 in 1918. In the last-named year the expenditure on higher education in the Union was £240,000.

**Finance.**—The unitary system of government adopted in 1910 was strongly marked in the financial provisions made. All public revenues were payable to the Union Government, and the funds needed to carry on the administration of the provinces were provided by grants from the Union Exchequer. By the Financial Relations Act which came into force in April 1913 the Union Parliament assigned the revenue derived from transfer duties, liquor licenses and native pass fees in Transvaal labour districts to the provinces, but gave the provinces no power of legislation in regard to such revenue. Other sources of revenue, such as education fees, trading and professional licenses were assigned to the provinces with power of legislation in regard thereto. A subsidy from Union funds of one half the ordinary expenditure of the provinces was also made, plus additional subsidies to Natal and the Orange Free State whose funds were shown to be inadequate to meet the necessary expenditure. The provinces are not allowed to borrow from any other source than the Union Treasury.

All trust moneys, (e.g. post office savings bank moneys) are handed over for investment to the Public Debt Commissioners. Any yearly surplus of revenue over ordinary expenditure is paid to the Commissioners and by them applied to the redemption of debt.

Revenue and expenditure of the Union is divided into two distinct funds, the ordinary or general, and the railway and harbours.

The following table shows the ordinary revenue and expenditure, for three typical financial years:—

	1913-4	1916-7	1920-1
Revenue	£15,980,000	£18,617,000	£28,381,000
Expenditure	£14,289,000	£15,490,000	£28,890,000

The chief sources of revenue for the year 1919-20, were as follows: Customs, £5,010,000; interest, £4,277,000; income, super, and dividend taxes, £4,050,000; posts, telegraphs and telephones, £2,031,000; excise, £1,228,000, and mining revenue, £1,023,000. The native poll and hut taxes produced altogether, £830,000. Among the main items of expenditure for the same period were: public debt, £6,940,000; provincial administrations, £3,520,000; justice, £3,209,000; postal, etc., services, £2,144,000; defence, £1,575,000; pensions, £1,200,000; interior, £1,019,000; agriculture, £861,000, and public works, £614,000.

Railway and harbour finance is controlled by a board presided over by a cabinet minister. The management of harbours and railways is required to be upon business principles. The following table shows receipts and expenditure for these services in the years named:—

	1913	1916	1918-9
Harbours (receipts)	£1,039,000	£1,031,000	£939,000
" (expenditure)	£900,000	£656,000	£479,866
Railways (receipts)	£12,388,000	£13,257,000	£11,680,000
" (expenditure)	£8,964,000	£8,891,000	£15,282,000

The war expenditure of the Union was met out of loan funds, the total charge on such funds amounting on March 31 1920 to £29,736,000. At the same date the public debt of the Union was £473,905,000.

#### THE SOUTH-WEST PROTECTORATE

After the surrender, in July 1915, of the German forces in S.W. Africa Gen. P. S. Beves was appointed military governor of the protectorate.<sup>1</sup> None of the German inhabitants was then repatriated and while the regular troops were placed in internment camps the civilians were allowed to return to their homes and continue their ordinary business. Mr. (afterwards Sir) E. H. L. Gorges, Secretary of the Interior in the Union, who had at Gen. Botha's request already drawn up a scheme for the future administration of the protectorate was made chief civil secretary. On Oct. 30 1915, on Gen. Beves's departure the two offices named were abolished and the functions of both taken over by Mr. Gorges with the title of Administrator. This post he retained until nearly the close of the military occupation period, which lasted till the end of 1920. Martial law remained in force but in a mild form and the administration was on civilian lines. At the beginning of 1917 it was found necessary to send an expedition to Ovamboland, the northern and most populous part of the protectorate, where German authority had been very slight. A chief named Mandume proved recalcitrant and two battalions, the first and the fourth of the S.A. Mounted Riflemen, together with a composite regiment of military constabulary were sent against him, Col. de Jager being in command. The expedition, despite fever, flood and dense forest, as well as the opposition of the natives, was successful. Excellent relations were afterwards established with the Ovambo.

In the rest of the protectorate S.A. rule was from the first welcomed by the natives, and the Germans gave no serious trouble. Until nearly the close of the World War they believed that the British occupation was temporary, being confident in the ultimate victory of Germany. This was evidenced by the fact that the German banks and traders maintained a rate of exchange of 24 marks to the £ sterling until Nov. 1918—the month of the Armistice. Instances were known of farmers selling their stock for sterling and converting it into paper marks. Where the artificial rate of exchange broke down serious losses followed. The Germans, however, continued to entertain false hopes, and after the Armistice they wrote to President Wilson asking his help on "self-determination" lines. They desired, they said, to become an autonomous republic leagued to the German republic, and this solution, they gratuitously added, would, they believed, meet the wishes of the natives. In 1919 the German

soldiers—about 5,800 in all—together with some 600 "undesirables" were repatriated. This still left, according to official figures, over 9,000 Germans in the protectorate. These German settlers continued hostile to Union rule, and obnoxious to authority. Lord Buxton, then governor-general of the Union, who visited Windhuk, the capital, in Oct. 1919, took occasion to inform them that the severance from Germany was irrevocable, and that the protectorate would in future form an integral part of the Union. Gen. Smuts when on an official visit to the territory in Sept. 1920 used similar language. The Germans had informed him that the country should be administered as "an independent province," and that the German civil code should continue, arguing that the introduction of the Roman-Dutch law would be "a retrogression of centuries." They also asked for the recognition of German as an official language, and the maintenance by the State of the German schools, but were refused.

By the treaty of Versailles Germany had renounced sovereignty over the protectorate, and in accordance with its provisions the Supreme Council in May 1919 assigned the mandate for the territory to the Union of S. Africa. An Act was passed by the Union Parliament in Sept. 1919 to give effect to the mandatory powers; finally the mandate was confirmed by the Council of the League of Nations on Dec. 17 1920. On Jan. 3 1921, martial law was withdrawn and Mr. Gysbert Hofmeyer, who had succeeded Sir Howard Gorges as Administrator in Oct. 1920, was given a nominated advisory council of six members. This council met for the first time on Feb. 2 1921.

**Settlers and Industries.**—In general the laws in force in, and the economic policy of, the Union was applied to the protectorate from the early days of Sir Howard Gorges's rule. Walvis Bay, the only good harbour on the S.W. coast, had languished. It had formed a small British enclave in what was German territory, and without hinterland, served only the purpose from which it got its name—a whaling station. Swakopmund was an artificial and poor port. The Union authorities built a line (22 m. long) from Walvis Bay to Swakopmund, and thus gave the protectorate its natural sea outlet. The whole length of the line from Walvis Bay to Windhuk was relaid on the standard S.A. gauge of 3 ft. 6 inches. In 1921 the Railways and Harbour Board undertook the construction of a line (132 m. long) eastward from Windhuk to Gobabis.

While no crown lands were alienated up to 1921 temporary licenses were granted and many members of the army of occupation on demobilization settled in the country with their families. A fairly large British-Dutch population soon grew up, evidenced sufficiently by the fact that in 1920 there were 975 children attending Government schools.<sup>2</sup> The new settlers were chiefly engaged in stock raising and farming; the copper, tin, and diamond mines were already in beneficial occupation, largely with British capital. The Otavi mines in the years 1916-8 produced 100,000 tons of copper ore, valued at £600,000. The expectation that the Luderitzbucht (Luderitz Bay) diamond fields would be thrown open to all comers was not realized. At the end of 1915 some of the companies on the diamond field were allowed to resume work; between Oct. 1915 and Jan. 1919 diamonds valued at £1,900,000 were obtained. Later the whole diamond field came under the control of one company, which entered into a working arrangement with De Beers and other diamond mining companies in the Union. The depression in trade led, in 1921, to the temporary closing of the mines. Depending upon diamonds for prosperity, was, declared Mr. Hofmeyer, like building on sand.

**Trade and Revenue.**—During the war external trade was all overland with the Union, trade being facilitated by the line built in 1915 from Prieska to Kalkfontein to connect the two railway systems. Customs duties were those in force in the Union, with free trade between the Union and the protectorate. During 1918 the value of imports was £1,031,000, about one half being S.A. produce. Of the total imports £409,000 represented the value of food and drink, and £181,000 cotton goods. The value of exports in 1918 was £817,000. The chief items were, diamonds £652,000, copper ore £55,000, cattle and small stock £57,000, horns, hides and skins £55,000.

The revenue of the protectorate in the financial year 1917-8 was £295,000; and in 1918-9 £377,000, of which £275,000 was from the tax on diamonds. The expenditure for the two years named was £650,000 and £744,000; as to more than three-fourths the expenditure was on the upkeep of the garrison.

**Native Affairs.**—Nowhere else had German methods of dealing with the natives been more ruthless than in S.W. Africa. The result of an examination of German judicial and administrative methods and documents was made public in 1918. It showed that not only

<sup>2</sup> The German settlers had separate schools. Efforts were made in 1921 to induce them to abandon these schools. They were offered "mother-tongue" instruction up to standard VI., coupled with the compulsory learning of either English or Dutch.

<sup>1</sup> For earlier events see GERMAN SOUTH-WEST AFRICA.

during the Herero and Hottentot wars but in peace time the natives were systematically subjected to brutalities and robberies, by the Government as well as by the settler. One consequence was that, apart from Ovamboland, where the Germans had little authority, the native population had decreased from some 130,000 in 1904 to 37,000 in 1911. In 1920 it was estimated at 80,000. To reconstruct, as far as practicable, tribal organization, Sir Howard Gorges established native reserves (over 4,000,000 ac. in all) controlled by hereditary chiefs, when such survived, or by an elected or nominated headman. To these men small salaries were given. Rules to protect natives in the railway and other public departments and in European private service were enforced.

#### THE NATIVE PROTECTORATES

No change was made in the political status of the native protectorates—Basutoland, the Bechuanaland protectorate and Swaziland—in the period 1910–21. They remained under the control of the Colonial Office, represented by the High Commissioner for S.A. and were administered by resident commissioners. They form in whole, or in greater part, native reserves, and the Basuto and Bechuana showed marked disinclination to incorporation in the Union of S. Africa. All three protectorates prospered.

**Basutoland.**—At the 1921 census the people numbered 500,544 (of whom 1,615 were whites and 155 Asiatics) compared with 403,845 in 1911 and 348,848 in 1904; of the total pop. in 1921 males numbered 224,435 and females 276,109. Maseru, the capital and largest town had (1920) approximately 900 native and 500 white inhabitants. Outside Maseru, the white residents are nearly all officials or missionaries. Ownership of land by whites is forbidden. Some 20,000 male Basutos are normally employed outside the country—mostly on the Rand gold mines. Agriculture and stock raising are the chief occupation of the people.

Education is in the hands of the missionary societies, except for four small Government schools. In 1919 there were in all 344 schools with 28,500 scholars, most of the schools being maintained by the French Protestant Mission (the Paris Evangelical Society). Grants in aid are made by the administration (£25,000 in 1920–1). Serious crime is rare and the drinking habits of the people, which once threatened their destruction, have been very largely abandoned under missionary influence. About one-fourth of the Basutos prefers Christianity. Trade is almost exclusively with the Cape and Free State provinces; the Basuto export grain, cattle, wool and mohair, and horses; and import mainly clothing, ploughs, saddlery, iron and tin ware, and groceries. The value of imports increased from £239,000 in 1908 to £1,137,000 in 1919. In the same period the value of exports rose from £193,000 to £1,380,000—in part due to inflated prices obtained for wool and mohair.

Financially Basutoland is self-supporting. Revenue is obtained from customs, licenses and, principally, from the poll tax on natives. This tax was substituted in 1911 for the hut tax previously enforced. A tax of £1 per annum on adult males was then put in force, but if a Basuto had more than one wife, he paid £1 per annum for each wife, up to a maximum of £3 for himself and his wives. This tax yielded £92,000 in 1913 and £106,000 in 1918–9. Total revenue increased from £145,000 in 1910–1 to £199,000 in 1919–20; the corresponding figures for expenditure were £134,000 and £202,000.

The system of government which under a resident commissioner allows a measure of home rule to the Basutos continued to work well. The *pitso* or national council meets yearly, 95 out of its 100 members being nominated by the chiefs and the other five by the administration. It has advisory powers only, but its advice is often taken. Sir H. C. Sloley who had been resident commissioner since 1901, and who earned the full confidence of the people, was in Dec. 1917 succeeded by Lt.-Col. E. C. F. Garraway. Letisie II., who had been paramount chief since 1905, died in Jan. 1913. He was a great grandson of Moshesh, the founder of the Basuto nation and dynasty, and was succeeded by his brother Griffith. When the World War began Griffith and his people offered to raise regiments for combatant service. The offer was declined, to the grief of the Basutos, to whom service with the labour contingent did not appeal. However, 1,400 Basutos served with the S. A. Native Labour Contingent in France, and many were employed in S.W. and E. Africa. The Basuto also contributed £50,000 to war funds. In 1921 the new High Commissioner, Prince Arthur of Connaught, visited Maseru, and the presence of a member of the royal house was made the occasion for a national tribute by the "Sons of Moshesh"—as the Basutos call themselves—to their loyalty to the British throne and their wish to remain directly under imperial control.

**Bechuanaland.**—The Bechuanaland protectorate is a much poorer country than Basutoland and the Bechuana are a less virile race than the Basuto. Bathoen, paramount chief of the Bangwaketse, died in July 1910 and Sebele, paramount chief of the Bakwena, died in Jan. 1911. Montsioa, chief of the Barolong, died in April 1911. All these chiefs were noted men in the early struggles between the Boers and British for the possession of Bechuanaland, Sebele being a son of the chief Sechele, the friend of David Livingstone. Khama,

the chief of the Bamangwato, and a Christian from his youth, still survived in 1921 and had then ruled over his people with undisputed authority for some 50 years.

The Bamangwato are the largest tribe, numbering about 40,000. The people grow maize, kafir corn and other crops but their chief wealth is in cattle, and cattle hides and skins are the chief exports. Firewood and timber for mining props are also exported. In 1917–8 exports to the Union included 23,600 horned cattle and 36,000 sheep and goats. The chief markets are Kimberley, Mafeking and Johannesburg. For customs purposes the protectorate is dealt with as part of the Union and no statistics as to value of imports and exports are kept. Revenue, £52,000 in 1910–1, first exceeded expenditure in 1915–6, when the figures were revenue £70,000, expenditure £68,000. In 1919–20 revenue was £81,500, expenditure £91,600. Deficits were made good by grants from the Imperial Exchequer. The seat of the administration is Mafeking, in the Cape province. Mr. J. C. Macgregor became resident commissioner in 1917. Khama's headquarters are at Serowe (pop., 1920, about 25,000).

**Swaziland.**—At the 1921 census the inhabitants numbered 113,772, of whom 2,203 were whites. Of the total pop. 54,702 were males and 59,070 females. The state of chaos into which Swaziland had fallen owing to the indiscriminate grant of concessions (see 26.181) was ended by 1914. The partition of rights between the European concessionaires and the Swazis was completed in 1911, and those natives who were required to move from properties held by whites by July 1914, did so voluntarily—such as did move, for many natives made terms with the concessionaires and remained on their farms. Out of a total area of 4,274,000 ac. 1,635,000 ac. were set aside as Swazi reserves; in addition the Swazis bought 77,000 acres. The Swazis raise maize and other crops and own large stocks of cattle while 7,000 to 10,000 Swazis are usually at work on the Rand mines. The whites engage in agriculture, including fruit farming and cotton and tobacco growing and in mining. The gold mines, which produced 6,497 oz. in 1915–6, were closed down as unprofitable in 1917. Tin of a total value of £346,000 was produced in the years 1915–20. The large coal deposits in the protectorate had not been exploited up to 1921. No separate statistics of Swaziland trade are kept. Revenue which in 1910–1 was £58,000 had risen to £91,800 in 1919–20. Expenditure in the same period rose from £62,000 to £87,000. The settlement of the concessions' questions cost £182,000.

The administration is under the charge of a resident commissioner, with headquarters at Mbabane, a small, picturesquely situated hill village (altitude 4,000 ft.) overlooking the middle veld. The paramount chief and other chiefs exercise jurisdiction in all civil cases in which natives only are concerned. Naba Tisibeni, the "queen regent," a well-known figure in Swazi history acted for many years as paramount chief, until the coming of age of her grandson Sobhuza (born about 1900). Education is mainly in the hands of missionaries; Sobhuza was educated at a Government school established at Naba Tisibenis Kraal. Mr. De S. M. G. Honey who had served in Swaziland since 1904 became in 1917 resident commissioner.

#### HISTORY

The 12 years (1910–21) following the establishment of the Union of S.A. were marked by political, racial and industrial crises which profoundly affected the future of the country. The most urgent issue was raised by a powerful section of the Dutch community, which revived a narrow Nationalism and developed a demand for the separation of the Union from the British Empire. Coupled with this conception went strong opposition to action against Germany, or any share in the World War. But this Nationalist section, whose greatest figure was ex-President Steyn and whose mouthpiece was Gen. Hertzog, was unable to control events. The policy of Gens. Botha and Smuts of "building up a new State on non-racial lines" and as an equal member of the British Commonwealth prevailed.

Besides this main issue the growth of an organized Labour party, which found its chief stronghold on the Rand and put forward an advanced socialistic programme, presented perplexing problems to a community new to such manifestations. The position of Indians in the Union, and the resolve of the white races to prevent further immigration of Asiatics was another problem which caused acute controversy, only partially silenced by the ultimate assent of the Government of India to the policy of exclusion. And behind all these questions was the ever-present problem of the relation between the white and native races. Signs multiplied that the Bantu peoples, gaining in knowledge and an increasing factor in industry, had acquired a sense of race solidarity and would not rest satisfied with their existing economic, social and political status.

While these racial and political questions held the field they were accompanied by a steady development of the material

resources of the country and of trade. The progress in agriculture and in mining was marked; a beginning was made in manufactures. The benefit of unification in this respect was apparent. That benefit was even more apparent in the relations of S.A. with the outside world; she spoke with one voice and as a powerful unit. The new position which S.A. had acquired, in common with the other British Dominions, was seen when as a separate entity she was represented at the Peace Conference in Paris and her delegates signed the Treaty of Versailles.

Outside the Union the period under review was chiefly noticeable for two things: the disappearance of German sovereignty accompanied by the transfer of the administration of ex-German S.W. Africa to the Union, and the decision to terminate the government of Rhodesia by the Chartered Company, in response to the demand of Rhodesians for self-government.

The Union had been brought about by the recognition by the leaders of the Dutch and British communities that S.A.

**Botha's  
First  
Ministry.**

was one country, not several, and that in every part of it the interests of the two races were so intermixed that they could not be separated without harm to both. Lord Gladstone, the first governor-general of the Union, had called upon Gen. Botha, the Prime Minister of the Transvaal, to form the first Ministry under the Union.<sup>1</sup> This Gen. Botha had done and this Ministry came into existence on May 31 1910, the day on which the Union was proclaimed (being the eighth anniversary of the close of the Anglo-Boer War). General Botha's Ministry was formed from members of the expiring Cabinets of the various colonies, but while it included Natal ministers and strong Boer partisans it was not a coalition ministry. The first general election, held on Sept. 15 1910, was fought on party lines and was hotly contested. It resulted in a majority for the "South African" party, that led by Gen. Botha, of 13 over all other parties, though Gen. Botha himself was defeated at Pretoria East by Sir Percy Fitzpatrick and a seat had to be found for him by means of a by-election. In the first session of the Union Parliament (opened by the Duke of Connaught on Nov. 4) Gen. Botha had the support not only of his own party, but of that of the four Labour members elected by Rand constituencies and of several of the Natal members of whom 13 out of 17 had been returned as Independents. The opposition, known as the Unionist party (and mainly British) was led by Dr. Jameson, who was created a baronet in Jan. 1911. Owing to ill health Jameson resigned the leadership in April 1912, and was succeeded by Sir Thomas Smarts, an ex-Cape minister and, like Jameson, a medical man. In Oct. 1912 Jameson resigned his seat for Albany (Graham's Town) and retired from Parliament.

General Botha's Cabinet was of a rather heterogeneous character. Among its members were Gen. Smuts, Mr. H. C. Hull, Mr. Jacobus Wilhelmus Sauer, Mr. Henry Burton, Mr. Abraham Fischer and Gen. Hertzog. They were divided on personal and provincial as well as progressive and retrogressive lines. General Smuts, Minister of the Interior, did not at first figure very prominently, but was the Prime Minister's right-hand man. Mr. Hull (b. 1860), after being in the Cape civil service, had practised at the bar, served in the war of 1899-1902 and was afterwards Treasurer of the Transvaal, and he entered the Union Cabinet as Minister of Finance. Mr. Sauer had been 30 years a member of the Cape House of Assembly and had frequently held office. In Gen. Botha's Cabinet he was Minister of Railways and Harbours and chairman of the Railways and Harbours

Board, and thus head of the largest revenue producing department of State. Mr. Fischer and Gen. Hertzog represented the extreme clement among the Boers. They were both from the Orange Free State, of which (as the Orange River Colony) Mr. Fischer had been Prime Minister. In the Union Cabinet he became Minister of Lands and Gen. Hertzog Minister of Justice.

The first session of Parliament was devoted mainly to putting the Union machinery into working order. It was not until towards the close of 1912 that Gen. Hertzog publicly abandoned the principles on which the Union had been established, though there was no doubt of his belief that the Dutch community had a prescriptive right to dominance in S. Africa. The most controversial issue considered in the 1911-2 session arose out of the Education Acts of the former Orange River Colony (see 20.160), where, during its brief period of self-government, Gen. Hertzog as Minister of Education had enforced bi-lingualism in the state schools. By the Act establishing the Union education "other than higher education" had been left in the control of the provincial councils for a period of five years, after which Parliament was free to take what action it pleased. In the meantime it could only advise. A select committee on which the S.A. and Unionist parties were equally represented considered the subject and on April 17 presented a majority report recommending that instruction up to Standard IV. should be given in and through the "home language," with the optional use, on the demand of parents, of the other language, and that above Standard. IV. freedom of choice in the medium of instruction should be left to the parents; also that teachers should be free to qualify in either language (English or Dutch). This was a reversal of Gen. Hertzog's policy, but though he disliked this compromise it was accepted by the Union Parliament (April 24). During 1911-2 the provincial councils of the Transvaal, Free State and the Cape passed ordinances adopting the compromise, though with some modifications in favour of Dutch. This virtually ended the language controversy as far as schools were concerned, and the provincial councils taking a liberal view of their duties, their control over elementary and secondary education was continued even after the lapse of the five years provided in the Union Act. But Gen. Hertzog's position was much shaken during the controversy over the medium of instruction. The success of an action for slander (Aug. 1911) brought against him by Mr. Wm. Fraser—Free State inspector of schools whom Hertzog had dismissed in 1909—caused much scandal, which was intensified by the success (Nov. 1911) of another slander action brought against him, the second plaintiff being Dr. Ward, president of the O.F.S. medical council. The situation was rendered piquant by the fact that Hertzog was Minister of Justice. He tendered his resignation, but Gen. Botha, not wishing to alienate the Boer extremists, refused to accept it.

Having brought about a settlement of the language question in elementary schools the Union Parliament was called upon to deal with higher education. The only university in S.A. at the time of the Union was that of the Cape of Good Hope, founded in 1873, with its seat at Cape Town. It was an examining body, with affiliated colleges. Demands for teaching universities had grown up and the Union Government had to deal with an offer of £500,000, half of this sum being a bequest by Sir Julius Wernher, the other half being given by Messrs. Alfred and Otto Beit. This money it was desired should go to establish a national university on the Groote Schuur estate, near Cape Town. A bill to give effect to this proposal was introduced into Parliament in the session of 1913. It met with much criticism and was withdrawn, a strong University Commission being appointed in Nov. 1913 to enquire into the subject. Its report, issued in 1914, is a valuable document, dealing fully with the lines of possible development, though the Commission was fain to acknowledge that the many vested interests constituted an "almost insolvable" problem. It recommended two universities—one at Cape Town and one at Pretoria, to one or other of which the existing university colleges would be attached. This recommendation provoked almost as much criticism as had the bill of 1913.

<sup>1</sup> Mr. J. X. Merriman, as Prime Minister of the Cape, the oldest colony in S.A., had some claim to be called upon to form the first Union Ministry, but his claims were passed over. He declined to serve under Gen. Botha. It appears, however, from the biographies of Jan Hofmeyr and of ex-President Steyn that both Botha and Merriman were prepared to serve under Steyn. Steyn was an invalid, and his doctors forbade him to entertain the idea of taking office. The ex-President was against a coalition Ministry, among other reasons because he feared that had Dr. Jameson been in the Cabinet he would have pressed for the inclusion of Rhodesia in the Union. While Steyn had favoured the Union movement he was not prepared even in 1910 to accept its full consequences. See J. H. Hofmeyr's *Once Jan.* (1913) and Van der Merwe's "Life" of Steyn (in Dutch 1921).

**Education  
Controversies.**

The Dutch community strongly opposed the proposal that Victoria College, Stellenbosch, founded in 1866 as the Stellenbosch Gymnasium and mainly attended by Dutch students, should be incorporated in the Cape university. A solution of the difficulty was reached in 1916 when Parliament passed Acts establishing three universities: the university of South Africa, the university of Cape Town, and the university of Stellenbosch. The two last were to be teaching universities and the seat of the Cape Town University was to be at Groote Schuur. It was formed by incorporating the South African College (founded at Cape Town in 1829) and to it the £500,000 of the Wernher-Beit bequests accrued.

The university of South Africa took the place of and was the legal successor of the university of the Cape of Good Hope, headquarters being removed from Cape Town to Pretoria. The new university, like its predecessor, was a federal organization with examining functions. Its first chancellor was the Duke of Connaught. The changes became effective on April 2 1918.

In the 1911-2 session of Parliament an attempt was made to grapple with the relations of the white and Kafir races, the position of Asiatics in the Union and with national and imperial defence. General Botha with two of his colleagues (Sir David de Villiers Graaff and Mr. F. S. Malan) had attended the Imperial Conference held in London in May and June 1911, when the Asiatic question and defence had been considered. The Union Government decided that S.A. should provide for its own internal defence, and a Defence Act was passed in June 1912, creating a citizen force at a cost of about £500,000 a year; this is in addition to a permanent force of five regiments.<sup>1</sup> The Act provided for the military training of 50% of the young men between 18 and 21; the other 50% being compelled to join rifle clubs and similar associations. The 50% for training are obtained in the first place by voluntary enlistment, but if sufficient numbers are not forthcoming by this method, then by ballot. (Recourse to the ballot had not been necessary up to 1922.) Members of the Citizen Force with the colours are paid. Provision was made for artillery, cavalry, infantry, engineer and transport units, uniformity with the units of the other overseas dominions being aimed at. General C. F. Beyers, one of the Transvaal commandants in the Anglo-Boer War, was appointed commandant-general, while the Council of Defence created by the Act consisted of Gen. Schalk Burger (Transvaal), Col. (afterwards Sir) Charles Crewe (Cape), Gen. de Wet (Orange Free State), and Col. Sir Duncan Mackenzie (Natal).

Objections to the Act came chiefly from the "back-veld" Boers who entertained strong dislike to compulsory service. The force being established, the reduction of the strength of the British imperial forces in S.A. from 11,500 to about 7,000 was announced in Nov. 1912. With regard to naval policy practically no progress was made. General Botha was fully alive to its importance and sought to educate his followers on the subject in several speeches. But in 1920 the situation remained as it was in 1910. The British Admiralty continued to use Simon's Town as headquarters of the Cape and East Coast Squadron. In 1921, however, the Government adopted the principle of the formation of a S.A. navy for home defence.

The policy to be adopted with respect to Asiatics had two aspects: (1) the treatment of Asiatics already in the Union and (2) whether or not to permit further immigration. On the second question there was a determination on the part of the great majority of white S. Africans to prohibit the further entry of Asiatics alike on racial and economic grounds. They had the black man ever with them and they were determined as far as in them lay not to add another racial and disturbing factor. But there were already 150,000 Asiatics in the Union, and except for some 2,000 Chinese they were all British Indians. Of these fully four-fifths lived in Natal. They had gone thither at the invitation of that colony, where the sugar and tea plantations depended upon coolie labour. Indeed almost the only dissidents in the Union from the exclusion

<sup>1</sup> Only persons of European descent were allowed to become members of the Defence Force.

policy were the Natal planters. On the question of immigration the Government of India, however, took a step which eased the situation. It was a vigilant champion of the rights of Indians settled in other parts of the Empire and it had been for years dissatisfied with the treatment of the coolies in Natal. In 1908 it had decided to prohibit the further importation of indentured Indians into Natal and it was at the request of the Natal authorities that it permitted the system to continue until July 1911, when it finally ceased. This left untouched the question of voluntary immigration, which among the coolie class was never great. The position in the various provinces of the Union differed. In the Orange Free State as a result of a rigid exclusion policy constantly enforced there was no Indian question; in the Cape province Indians enjoyed equal rights with whites—political and municipal, not only in theory but in practice. But comparatively few Indians were attracted to the Cape and in that province the question was not acute. The Cape Immigration Acts of 1902 and 1906 sufficiently guarded the province from the influx of undesirable elements. In Natal the matter was much more pressing. There the Indians considerably outnumbered the whites and besides the coolie class included many Bombay Mohammedans (often misnamed "Arabs" in S.A.), keen and enterprising traders. Measures restrictive of Indian enterprise had been passed by Natal and in that province they had no political rights. They however possessed the municipal franchise and, as in the Cape province, had unrestricted rights to own and occupy land. In the Transvaal the Indians had neither political nor municipal rights nor were they allowed to own land, save in specially assigned locations. The Indians in that province were mainly Moslem traders, who had found a favourable field for their activities in the development of the country which followed the discovery of the Rand gold mines. For years the Indians in the Transvaal had been subjected to many restrictions; it was in this province that feeling against them was most bitter and the agitation against them most strong. The position held by white S. Africans was plainly stated by Gen. Smuts at the Imperial Conference of 1917. What he then said was strictly applicable to the situation in 1911 when the Union Parliament first took up the subject.

In S.A. there has been this fundamental trouble [he said], that the white community has been afraid of opening the door too wide to Indian immigration. We are not a homogeneous population. We are a white minority on a black continent, and the settlers in S.A. have for many years been actuated by the fear that to open the door to another non-white race would make the position of the few whites in S.A. very dangerous indeed. It is because of that fear . . . that they have adopted an attitude which sometimes has assumed the outward form, although not the reality, of intolerance.

Save that among many of the whites in the Transvaal the outward form of intolerance was also its reality, this was a fair statement of the position of white S. Africans. They feared, or a considerable proportion of them feared, being swamped by Asiatics, and, especially in the Transvaal, they greatly feared Indian competition in trade. On its part the Government of India, when the Union began legislating on the subject was ready to acquiesce in an exclusion policy, but sought in return to secure fair treatment for the Indians already in the Union. And by "fair treatment" the Government of India meant in the long run political and municipal rights—weapons by which the Indians would have effective means of self-protection. In 1911 and again in 1912 Immigration Restriction bills were introduced into the Union Parliament, but the bills were dropped, a wider measure being announced for 1913. In Oct. 1912 Mr. G. K. Gokhale, one of the most influential of Indian politicians, visited S.A. on "a mission of peace" and in Nov. went to Pretoria as the guest of the Union Government to confer with them on the forthcoming legislation. Mr. Gokhale's object was primarily to secure concessions for the Indians already in S. Africa. This was also the main object of Mr. M. K. Gandhi, who had first gone to S.A. in 1893 to conduct a law suit, but had stayed there and become the leader of the Indians in Natal and the Transvaal.

In June 1913 the Union Parliament passed an Immigrants Regulation Act, the chief purpose of which was to prevent the

further entry of Asiatics into the Union. This was done not *eo nomine* but by ministerial certificate. Wives and young children of domiciled residents were allowed to enter, and also registered Indians who might be temporarily absent from S. Africa. The Act further restricted Asiatics to the province in which they were resident. This restriction of movement, and the poll tax of £3 levied on all ex-indentured Indians in Natal—a tax unequal and uncertain in its incidence—caused great dissatisfaction among the Indian community. Under Mr. Gandhi's leadership (Mr. Gokhale had returned to India) they adopted an attitude of passive resistance, but this was succeeded by strikes at Durban and at the collieries and plantations. Then, to assert the right of Indians to move from one province to another, Mr. Gandhi put himself at the head of some 2,700 Indians who started to march past Majuba to Johannesburg. About 500 were stopped at the Natal border, the rest got some distance into the Transvaal before they were turned back. Mr. Gandhi was arrested and convicted on several charges, e.g. he was sentenced to nine months' imprisonment for abetting a strike of coal miners. But the situation could not be met simply by repressive measures. An Indian Inquiry Commission was appointed and, on its recommendation, the Natal poll tax was abandoned and certain concessions made as affecting the recognition of Indian marriages. These changes were made operative by the Indian Relief Act, 1914. More important was the so-called Smuts-Gandhi agreement of the same year. General Smuts as Minister of the Interior was in charge of the legislation affecting Indians, and, seeking a statesmanlike solution of the difficulty, he approached Mr. Gandhi. The negotiations succeeded and the arrangement reached was set forth in letters exchanged between Mr. Gorges (then secretary to the Ministry of the Interior) on behalf of Gen. Smuts, and Mr. Gandhi and dated June 30 1914. The essence of the agreement was the assurance by Gen. Smuts that existing laws would be administered "in a just manner and with due regard to vested rights." This was at the time interpreted by the Indians, by the Government of India and by many of the whites in S.A. to mean that the rights which Indians were entitled to exercise under the laws as existing in 1914 could not be restricted by fresh legislation. Mr. Gandhi, conceiving his mission in Africa ended, returned shortly afterwards to India.

It is convenient here to summarize later developments of the Indian question before turning to the main stream of S.A. history. Mr. Gandhi in a farewell letter, published in the *Rand Daily Mail* of July 20 1914, had assured the Indians that the settlement then reached did not preclude them from fresh agitation for the removal of other disabilities: for their part a large section of the whites agitated for further restrictions upon Indian activity. Friction inevitably arose, but during the World War untoward incidents were avoided. A definite settlement of the immigration question was reached at the Imperial Conference of 1918 when a reciprocity resolution was accepted which declared it to be "an inherent function of the governments of the several communities of the British Commonwealth, including India, that each should enjoy complete control of the composition of its own population by means of restriction on immigration from any of the other communities." In accepting this resolution on behalf of the Union Mr. Burton declared, justly, that S. Africans had found the Indians "good, law-abiding, quiet citizens" and that it was the duty of the Government to see that they were treated "as human beings, with feelings like our own, and in a proper manner."

What was the "proper manner" was still a point of contention. After the Smuts-Gandhi agreement Indians applied for and obtained new licences to trade, and in the Transvaal formed private companies with limited liability for the purpose of acquiring land and fixed property—the Transvaal law of 1885 which prohibited individual Indians from acquiring land not applying to corporate bodies. This action by the Indians was denounced by the white community in the Transvaal as a flagrant violation of the Smuts-Gandhi compact, to which the Indians replied that it was one of their vested rights and that

such companies had been formed before the agreement was made. There were in fact three such companies in 1913; by March 1919 the number registered had grown to 370, with a total capital of £479,000. Early in 1919 the Krugersdorp municipal council brought the matter to an issue, nominally on the trading question, by obtaining an interdict from the Supreme Court at Pretoria, prohibiting Indians from occupying a certain trading "stand" in the town. This led to the appointment of a parliamentary select committee. As the result of its investigations an Act (No. 37 of 1919) was passed by the Union Parliament which, while confirming the right of Indians to the occupation of land for trading purposes which they then held, prevented the further acquisition of land by Indians through private companies.

The Act of 1919 pleased neither party. It was noteworthy that in the Transvaal, where numerically the Indians were few, feeling against them was much stronger than in Natal, with its large Indian population. The explanation was to be found in the fact that whereas in the Transvaal nearly all the Indians were traders—many of them merchants owning large businesses and formidable competitors with white traders—in Natal the great bulk of the Indians were Madrassi of the agricultural and labouring classes, and save in fruit and vegetables did not enter largely into trade. Moreover, large numbers of the Indians in Natal were S.A. born and could hardly speak any Indian language. The agitation in the Transvaal against the "Asiatic menace" led in Feb. 1920 to the appointment of the Asiatic Inquiry Commission specifically charged to consider the question of trading rights and land ownership by Indians. The sittings of the Commission were held in public, the Government of India being represented throughout by Sir Benjamin Robertson, a man with unrivalled knowledge of the history and facts relating to Indians in S. Africa. The Commission issued an interim report in May 1920 recommending that steps be taken to aid the repatriation of as many Indians as desired to leave the country, and some few thousands did return to India. The final report of the Commission was issued in March 1921. The chairman was Sir J. H. Lange, a judge of the Supreme Court, and all the commissioners were men of experience, animated with the wish to do justice. Their inquiry had the merit of bringing out the facts and dispelling the belief that the Transvaal was menaced, numerically, by an Asiatic invasion. They also made clear the fatuity of the proposals put before them for the compulsory expropriation of the whole Indian population, or of "squeezing them out" by multiplying restrictions on their activities. Their recommendations were however significant of the strength of white feeling on the subject. They proposed alterations in the law which would secure Indians from being refused trading licences arbitrarily or on the ground of race; they opposed compulsory segregation, but advocated a system of voluntary separation by "attraction" to desirable residential and trading areas. They opposed the repeal of the Act of 1919 and went further by proposing that in Natal the right of Asiatics "to own land for farming or agricultural purposes should be confined to the coast belt, say 20 to 30 m. inland." On this last point Mr. Duncan Baxter, one of the four commissioners, dissented, describing it as retrograde and a breach of the conditions of recruitment. The Government of India also at once lodged a protest against this recommendation, holding that it was not only a breach of the conditions under which Indians were recruited but also a breach of the Smuts-Gandhi agreement. The Union Government took no action on the Commission's report in the 1921 session of Parliament, but Mr. Patrick Duncan, who had become Minister of the Interior, indicated his sympathy with a proposal to allocate separate and distinct areas for occupation by the Indians of Natal.

The Government of India, while still seeking the removal of particular grievances, adhered to its wider view that only by the grant of equal rights could Indians in the Dominions be fully protected. At the Imperial Conference held in June-Aug. 1921 the Indian delegates pressed for the recognition of this principle and it was accepted by the representatives of Canada, Australia and New Zealand. But the S.A. delegates, of whom the chief

were Gen. Smuts and Sir Thos. Smartt, declined to subscribe to the resolution which declared that it was desirable that "the rights to citizenship" of Indians lawfully domiciled in other parts of the Empire "should be recognized." They regretted "their inability to accept this resolution in view of the exceptional circumstances of the greater part of the Union." Direct negotiations between the Governments of India and of S.A. to reach a more satisfactory position were not precluded. That the Union delegates rightly interpreted the feeling of most white South Africans was shown by an ordinance passed at this time by the Natal provincial council to prevent any Indians in the province acquiring in future the municipal franchise. This ordinance was disallowed by the Union Government. At the Cape at the same time an Indian, Dr. Abdurrahman, a well-known member of the Cape Town municipality, was also a member of the provincial council.

The first step taken by the Union Government in regard to the relations between the white and native races was the decision that the control of all regulations made by local authorities affecting natives should be exercised not by the provincial councils but by the Government through the Native Affairs Department, a decision tending towards a much-needed uniformity of policy.

While the Government were considering what principles should guide their action public attention in 1911-2 was chiefly focussed on one aspect of the question, assaults by Kaffirs on white women. On the Rand in the first half of 1911 three Kaffirs were shot by white women whom they had attempted to assault. This shooting followed the commutation, in Jan. 1911, by the High Commissioner (Lord Gladstone) of a death sentence on a Rhodesian native convicted of an attempt to assault a white woman. This action roused much indignation against the High Commissioner who, however, met his critics fairly and won their respect. But feeling was intensified by the acquittal in Aug. 1911, by a Rhodesian jury, of a white man who had shot dead a Kaffir. (This led to the making of a special jury list for the trial of such cases, the ordinary jury not being trusted to administer impartial justice.) In all during the year ending March 31 1912, there was in the Union alone (*i.e.* Rhodesia excluded) 85 cases of outrages upon Europeans by natives, as compared with 69 during 1910. On the Rand the evil was attributed in part to illicit liquor selling and in part to the fact that the mine labourers were without their women-folk, and a petition signed by 52,000 Rand residents (presented to Parliament May 1912) asked *inter alia* for the provision of compounds in which natives should be permitted to keep their wives, as well as for facilities for training native female servants and for the importation of European domestics.

A commission, appointed in June 1912 on the motion of Sir Thomas Smartt, enquired into the prevalence of sexual assaults, and the extent to which they were attributable to economic and social factors. This commission was presided over by Mr. Melius de Villiers, ex-chief justice of the Free State and included four servants, one from each province. On its report remedial measures were taken, such as provision for wives in the compounds. It was shown that one cause of the evil was the undue familiarity with which many white women treated male natives employed by them as domestic servants. The measures taken had a good effect, and assaults of the character stated became fewer.

On the larger question as to the place which the Bantu should hold in the community there was much heart searching. There was on the part of the whites agreement on one point only—the dependence of agriculture and industry on the manual labour of the native. The situation was complicated by the fact that the whites had not only the native to deal with but a very large number of coloured persons with a greater or less proportion of white blood—the well-known "Cape Boys." These people not only competed with the whites in skilled labour, but a good many of them had entered the professions as lawyers, doctors, journalists, land surveyors, etc. The pure African was following their example, and both the coloured and native peoples were learning the power of coöperation. They had their own newspapers, their own political and trade organizations,

and were quick to learn from the methods of the whites. Especially powerful was the influence of education and Christian missions. Many natives made great sacrifices to obtain education. For educational facilities they had to rely chiefly upon the missionary societies. The provincial councils were not generous in their expenditure in this respect though the total expended on native education rose from £81,000 in 1913 to £137,000 in 1918. More than half the total sum was spent by the Cape province. In regard to higher education the Union Government took a somewhat more liberal attitude and gave its support to the South African Native College at Fort Hare.

The desire of the natives, or the more vocal section of the natives, to escape from European tutelage was seen in a growing inclination, particularly in the Transkeian territories, to secularize education and to obtain a larger share in its management. This desire for "self-determination" was also seen in the setting up of many churches independent of European control, a movement fostered by intercourse with the negro churches of the United States. Of these native separatist churches perhaps the most influential was the "Ethiopian Church of South Africa." Their leaders joined in the demands of the "Native National Congress," an organization claiming to represent the Bantu peoples of S.A., in demanding redress of grievances and in especial the removal of the colour bar which existed in all the provinces except the Cape. A deputation from this body came to England in 1919 "not to demand independence, but admission into British citizenship."

Such were the aspirations of educated men among the coloured and native races; the more extreme, among whom communist doctrines had gained a hold, raised the cry of "Africa for the Africans." The loyalty of the natives and the valuable services they rendered during the World War went to show that the extremists were not an immediate danger. But the natives also during the war got a new idea of their power. Bantus in Rhodesia, the "Cape Boys" from the Union served as combatants in the E.A. campaign—and they saw that the heaviest fighting there fell to black troops. A new situation had arisen, one of the most noteworthy being the development of a race, as distinct from tribal, consciousness.

The problem as it presented itself to the Union Government was how best to secure the future for the white race in S.A., surrounded as it was by a black population five or six times its numbers. The Government would have had to face the bitterest hostility of the Dutch community, and of a considerable section of the British in Natal and the Transvaal had they attempted to remove the colour-bar in those provinces or in the Free State; had the Boers had their way the colour-bar would have been set up in the Cape province. Gen. Botha did not subscribe to the principle of Cecil Rhodes—"equal rights for all civilized men." Yet he and his colleagues acknowledged that it was the duty of the State to help forward the native on the path of efficiency and civilization, in opposition to the standpoint of the extreme Dutch Nationalists that there was no room for the advancement of the native save at the expense of the white man. The point of view of the Government was that the natives should be aided in such a manner that they should not come into competition with the whites. The proposal which attracted most support was to keep blacks and whites in separate areas, while still employing natives for labour on white enterprises. The plan was feasible; it was for example being worked in Basutoland under the Colonial Office. In that territory white settlement was forbidden, but thousands of Basutos went on contract to the gold-mines or to farms in the Free State. And there were already native areas in the Cape, such as the Transkei, where, under white officials, the natives possessed some share in the administration. It was in this direction Gen. Botha looked for a solution of the problem. In a speech in Parliament (May 9 1912) he stated that "the time was coming when the native question would have to be considered most seriously in the direction of keeping whites and natives apart and preventing their intermingling. They would have to fix attention closely on the question of segregation, while treating everyone with absolute

justice." The segregation plan received the support, among many others, of Sir Matthew Nathan, an ex-governor of Natal, and Gen. Hertzog. But it was opposed by those who, like Mr. P. W. Schreiner and Mr. Patrick Duncan (a leading member of the Unionist party), regarded it as both wrong and impolitic to put hindrances in the way of the advancement of the natives in civilization and industrial efficiency. Mr. Duncan in a striking pamphlet published in Oct. 1912 ("Suggestions for a Native Policy") admitted the dangers foreseen by the segregationists, but believed the remedy to be in European immigration on a large scale. "Nothing else," he declared, "will save S.A. for the European race." But to immigration on a large scale the Dutch community was definitely opposed, and it was not till 1920 that the Government made any strenuous effort to attract white settlers to the country.

A motion brought forward at the Unionist Congress in Johannesburg (Nov. 21 1912) to commit the party to the policy of segregation was defeated, the previous question being carried by 91 votes to 7. Opinion being so divided the Union Government found great difficulty in shaping its native policy. As a temporary measure a Native Land Act was passed in 1913 which prohibited the further acquisition of land by natives or from natives—an Act which led to vehement protests from native associations and leaders of native thought, while a legal decision was obtained that the provision of the Act did not apply to the Cape province. The Act had set up a commission, under the chairmanship of Sir William Beaumont, which had for its object the ascertainment of what land areas should be allocated to natives and those from which they should be excluded. The commission reported in 1916 and a Native Affairs Administration bill was introduced in 1917, chiefly as a means of ascertaining public opinion, native as well as white. It embodied the principle of separate areas in rural districts. After exhaustive consideration Parliament in 1920 passed a Native Affairs Act which was in effect a half-way segregation measure. The Act, for which Gen. Smuts was largely responsible, was based on the principle that the white man is the permanent and predominant factor in the civilization and government of S. Africa. But it was not repressive to the black man. It set aside areas for the exclusive occupation of the natives in which they would have greater opportunities than before for obtaining local self-government, it opened the way to a system of representative native congresses which would express authoritatively native opinion on intended legislation, and it held out the prospect of the development of native institutions parallel to but separate from those of the whites. In short Gen. Smuts, the great advocate for the union of the two European races in S.A., was equally earnest in his efforts to keep the streams of white and (nascent) black civilization apart. A feature of the Act of 1920 was the establishment of a permanent Native Affairs Commission to deal with the position of natives in urban areas, education and the Pass Law system, in all of which matters it was admitted that the natives had not received fair treatment. The Act was regarded by the white community—Dutch extremists apart—as a piece of constructive statesmanship, and its policy received the approval of the most responsible leaders of the natives. But danger lay in the inflammable language and actions of less responsible, and less educated agitators, working on the mass of their fellows, scarcely emerged from barbarism, and in the equally pernicious utterances of the white extremists. Events in 1920-1 showed the peril attendant on any mishandling of the native question.

The promotion of trade and agriculture occupied much of the energies of the people and Government. A prolonged drought—lasting from Oct. 1911 to Nov. 1912—the most severe experienced in S.A. since 1862, affected chiefly Natal, the Transvaal and the Transkei. The severe losses sustained forced attention to the need of more scientific farming and to irrigation works, upon which the Government expended £500,000 in 1912. In 1919 there was another very serious drought involving the country in an expenditure of £16,000,000. This led to the appointment of a commission in 1920 to enquire into drought, soil erosion and other allied prob-

lems. One result was to emphasize the need of water storage in connexion with irrigation. In Oct. 1912 a State Land and Agricultural Bank began operations in the Union, and a similar institution was established in Rhodesia.

Much diversity of view existed as to the tariff policy of the Union. Early in 1912 a commission, of which Sir T. M. Cullinan was chairman, appointed to enquire into the conditions of trade and industries reported in favour of increased duties on wheat, flour, sugar, tea, clothing and furniture, declaring that it was "not only necessary that a policy of protection should be adopted, but that there should be continuity of policy." Two influential members presented minority reports in favour of the "open-door." Rhodesian feeling was in favour of a lower tariff, and it was suggested that Rhodesia might withdraw from the Customs Union rather than bear greater fiscal burdens. At Johannesburg on Nov. 19 1912 Sir Thomas Smartt declared that a plank in the Unionist party's platform was a tariff primarily for revenue purposes, combined with a policy for the encouragement of industries for the general benefit and the extension of the existing imperial preference. This was, in the main, the solution adopted. Tariffs and rebates were fixed by various Acts of Parliament passed between 1914 and 1919, designed to afford relief to home manufactures, the majority newly established. An Industries Advisory Board was set up in Oct. 1916, consisting for the most part of business men, and early in 1917 a Scientific and Technical Committee was instituted. There followed in 1921 the creation of a Board of Trade and Industries, and a definite policy of industrial development was undertaken by the Government. But Mr. F. S. Malan, Minister of Mines (and then acting Prime Minister) addressing the convention of the Federated Chamber of Industries at Port Elizabeth (July 25 1921) declared that the Government had no intention of "going in for an out-and-out protective policy." And Col. Reitz (Minister of Lands) told the sugar planters of Zululand that "the consumer must be protected. Higher tariffs would mean dearer prices."

One great department of state, the Railways and Harbour Board, was required by the Act of Union to be run with due regard to agricultural and industrial development and not as a producer of revenue for extraneous purposes. The Board built needed railway lines and undertook harbour works, though nothing material was done to enlarge the docks at Table Bay, a matter which provoked strong protests from the citizens of Cape Town. Mr. Sauer, the minister in charge of the department—whose budget was separate from that of the general budget of the Union—took an independent view of his duties and as early as July 1911 differences arose between him and his colleagues, especially with Mr. Hull, the Finance Minister. Mr. Hull had also to meet the attacks of Mr. Merriman, the most accomplished parliamentarian and ablest financier in the House of Assembly and a very candid friend of the Ministry. Mr. Merriman denounced the Government's financial proposals as predatory and extravagant, while Mr. Hull alleged that railway expenditure was incurred without Treasury sanction—that there had been a tendency to regard the railway and harbour administration as something for which the Government had no collective responsibility. General Botha admitted that the Cabinet had not been sufficiently consulted in railway matters and on May 18 1912 Mr. Hull resigned. A reconstruction of the Ministry was postponed until after the close of the parliamentary session (June 24), when the chief changes made were the appointment of Mr. Henry Burton (an ex-Cape minister), to the Ministry of Railway and Harbours, while Mr. Sauer became Minister of Agriculture, an office which Gen. Botha had combined with the premiership.

The differences between Mr. Hull and Mr. Sauer were shortly afterwards forgotten in consequence of the attitude taken up by Gen. Hertzog, who now began publicly to assail the principles upon which the Union had been established. To what extent Hertzog was supported or restrained by ex-President Steyn is uncertain; but Steyn, whose opinion would have been decisive with a large section of the Dutch community, did nothing publicly to counter-

*Trade and Tariffs.*

*The Two Streams Policy.*

act the rekindling of the fires of racial bitterness. The by-election campaign at Albany, caused by the resignation of Sir Starr Jameson, brought about a crisis. General Botha, and with him Gen. Smuts and the majority of the Dutch members of the Cabinet, had definitely accepted the British connexion, and the position of S.A. as a self-governing member of an Imperial Commonwealth, with corresponding responsibilities, and, knowing that peace between the two white races was essential to the prosperity of the country, he was an ardent advocate of the closest co-operation between them. On both these points Hertzog was violently opposed to his colleagues. His motto "South Africa first" meant in fact Dutch supremacy. In a speech at Nylstroom (Oct. 1912) he characterized Sir Thomas Smarrt (who had succeeded Jameson as leader of the Unionist party) and other prominent members of the Opposition as "undesirable political foreign adventurers," and at Rustenburg, on Dec. 8, he declared that imperialism appealed to him only when it was useful to S. Africa. He had a short time previously pronounced in favour of the Dutch and British in S.A. remaining "two nationalities flowing each in a separate channel." General Botha though he publicly dissented from Gen. Hertzog's views was desirous if possible to avoid an open breach, but after the Rustenburg speech action was unavoidable. On Dec. 12 Col. Leuchers, Minister of Public Works and a Natal member of Parliament, resigned as a protest against Hertzog's "anti-British and anti-imperial sentiments." Botha then intimated to Hertzog that his resignation would be acceptable, but Hertzog refused to move. Botha met this difficulty by tendering his own resignation, Dec. 15, and was at once asked by the governor-general (Lord Gladstone) to form a new Ministry. This he had accomplished by Dec. 20, the new Cabinet being composed of the same members as the old except for the omission of Gen. Hertzog and Col. Leuchers (the latter replaced by Sir Thos. Watt, another Natal member). The death of two ministers—Mr. Sauer and Mr. Fischer—during 1913 necessitated a further remodelling of the Cabinet. Mr. N. J. de Wet became Minister of Justice and Mr. H. C. Van Heerden Minister of Agriculture.<sup>1</sup>

The cleavage in the ranks of the ministerialists (the S.A. party) became complete in 1913. It was soon apparent that the appeal to Dutch racialism had considerable support, notably in the O.F.S., and some 10 or 12 members of the House of Assembly elected as supporters of Gen. Botha turned to Hertzog as their leader. At the party conference opened at Cape Town on Nov. 30 Gen. de Wet nominated ex-President Steyn as "leader of the party outside Parliament, with power to nominate the Prime Minister." On this proposal being defeated the malcontents left the conference in a body and in Jan. 1914 a new party under Hertzog's leadership was formed. It took the title of the Nationalist party.

The year 1913 and the opening months of 1914 were, however, as notable for labour unrest as for political differences. The disturbances in Natal due to the opposition of the Indians to the Asiatic legislation of the Union have already been recorded. They caused no such trouble as attended disturbances on the Rand, which began with a strike of the white miners at the New Kleinfontein mine in May 1913. The strike was nominally on the question of hours, but it was symptomatic of a determination of Labour to gain greater control over industrial conditions. There was, too, a revolutionary wing to the movement, and the extremists seemed likely to carry with them the mass of the men.<sup>2</sup> The two antagonistic views were afterwards sharply put by Gen. Smuts and Mr. Creswell, the latter the leader of the parliamentary Labour

<sup>1</sup> The year 1913 witnessed the death of other prominent S. Africans—Sir Gordon Sprigg, four times Prime Minister of Cape Colony, Sir Richard Solomon, High Commissioner in London of the Union, and Dinizulu, the son of Cetywayo. Sir Walter Hely-Hutchinson, formerly Governor of Natal and of Cape Colony, also died in 1913. Sir R. Solomon was succeeded as High Commissioner by Mr. W. P. Schreiner, who died in 1919. Sir Edgar Walton was appointed High Commissioner in 1921.

<sup>2</sup> The white employees in the mines were almost equally divided between those born in S.A. and those born in the United Kingdom. The foreign born were scarcely 5%.

party. Smuts declared the movement to have been "a conspiracy against constituted order." Mr. Creswell declared that there was "a conspiracy (of the Govt.) with capitalists to run the country in their own interests." Neither view gave a satisfactory explanation of the facts. The strike extended, negotiations for a settlement failed, feeling ran high and by the end of June the Government had drafted 2,000 troops into the Benoni district, the centre of unrest, and some 20 m. E. of Johannesburg. The leaders of the strike had chosen a time when the Union was without a regular armed force of its own. The citizen army provided by the Act of 1912 was not yet formed, while the militia and volunteers had been disbanded as from July 1, and the permanent force—the S.A. Mounted Riflemen—provided for in the Act of 1912, had only begun training in April (1913). British regulars were therefore drafted into Johannesburg, where serious rioting followed a demonstration by the men in Market Sq. (July 4). The strikers seized the electric power station, and during a night of terror burned down the Park railway station and the offices of the *Star* newspaper. Several persons were killed and many injured in conflicts with the police and military. The next morning Gens. Botha and Smuts intervened and opened negotiations with the strikers. While these were going on dynamite explosions occurred and the mob attacked the Rand club. The negotiators succeeded in reaching agreement and at night the strike was declared "off", one condition being the reinstatement of the men at the New Kleinfontein mine. But it was difficult to appease the mob and there was further rioting on July 6. In all some 20 persons were killed and 250 injured. A grave element of danger was the excited condition of the native labourers on the Rand mines and it was in part consideration of what they might do if the riots continued that drew the authorities and the strike leaders together. The situation continued anxious, as extremists were calling for a new and general strike. But on July 31 the executive of the Federation of Trades decided by 65 votes against 18 not to call a general strike. An official inquiry into labour conditions was then instituted, but in Jan. 1914 new trouble arose. A policy of re-trenchment on the railways was resented by the men and a general strike proclaimed for Jan. 14. It was, according to the official view, an attempt by the Trades' Federation to control the railway administration. The Government acted promptly (Gen. Smuts was at the time both Minister of Defence and Minister of the Interior). Martial law was proclaimed and 20,000 troops mobilized and concentrated on the Rand. Ten prominent Labour leaders—not including Mr. Creswell—were arrested and secretly deported, illegal action for which the Government subsequently obtained an Act of indemnity. In Parliament Gen. Smuts justified his action on the ground stated, namely that the leaders of the men were engaged in a revolutionary conspiracy. The action of the Government had, in any case, prevented a renewal of the rioting of 1913 though a large number of outrages occurred. Ameliorative measures were then tried and during 1914 an Industrial Disputes Act was passed. It set up machinery intended to render easier the settlement of disputes and this Act was followed in subsequent years by other measures—such as the Factory Act of 1918—designed to improve labour conditions.

In 1914 Lord Gladstone's term of office as Governor-General and High Commissioner expired and he returned to England shortly before the outbreak of the World War. His successor was Mr. Sydney Buxton, who on his appointment was created a viscount. Lord Buxton assumed office in Sept. 1914.

The outbreak of the World War tested S.A. in a manner in which no other British Dominion was tested. Twelve years only had passed since the Boers had been in arms against Great Britain, they had long and bitter memories and all the ties of kinship, affection, a common tongue and a common heritage which powerfully influenced the British in S.A. were in them lacking. The spirit of racialism had revived, and a large number of the Dutch were led to believe that the war was no concern of theirs and that S.A. should remain neutral. A smaller section actively sympathized with Germany and a few prominent Boers had entered into rela-

Effect of  
World  
War.

tions with the Germans in S.W. Africa. The German Government counted with some confidence that S.A. would stand aloof from the contest. It was misled. The attitude of Gen. Botha and of his colleagues was never in doubt. Botha, Smuts and the other Dutch members of the Government represented all those Boers who were not only faithful to the new allegiance they had solemnly recognized in 1902, but who were sincerely convinced that by the subsequent grant of responsible government to the ex-Dutch republics and the establishment of the Union, S. Africa's interest, as a self-governing dominion, was to stand side by side with the other members of the British Commonwealth.

The test as to the part S.A. would play in the World War soon came. On Aug. 7 1914, the Imperial Government telegraphed to the Union Government that "if they desired and felt themselves able" to do so, the seizure of such parts of German S.W. Africa as would give them the command of Lüderitzbucht, Swakopmund and the wireless stations there, would be "a great and urgent imperial service." And two days later the British Cabinet suggested that another expedition might be sent later to Windhuk, where there was a long-distance wireless station. On Aug. 10 Gen. Botha replied that he and his colleagues cordially agreed to coöperate with the Imperial Government and that the military operations indicated would be undertaken by the Union Government. General Botha had already intimated—on the day that war was declared—that the country would undertake its own defence, thus setting free for duty elsewhere the imperial garrison in S. Africa. It was not however until Sept. that Gen. Botha publicly announced the intention of the Government to send an expedition against German S.W. Africa, though this intention was communicated to Gen. Beyers on Aug. 13 and discussed at a meeting of the principal officers of the defence force held on Aug. 21. On that occasion Beyers expressed approval of the measures proposed. While their intentions in regard to S.W. Africa were meanwhile regarded as confidential, the fact that the Government had ranged itself on the side of Britain had been known from the first day of the war and had greatly excited the Dutch Nationalists. Some of them saw in it the opportunity they had eagerly awaited of regaining the independence of the Boer republics; some were already aiding the Germans in S.W. Africa. The decision of the Government to take the offensive against the Germans precipitated, but was not the originating cause of, the rebellion. German secret agents, too, had been busy, but their intrigues at most only served to fan smouldering fires of revolt. Botha submitted the resolution authorizing an expedition to German S.W. Africa at a session of Parliament on Sept. 9. It was bitterly denounced by Hertzog and his followers, who declared that the Union should remain neutral, but it passed the House of Assembly by a large majority on Sept. 10 and by the 14th had received the approval of the Senate.

On Sept. 15 Gen. Beyers made clear his true attitude. He resigned his post of commandant-general of the Union Forces, affirming that "by far the great majority of the Dutch-speaking people of the Union" disapproved the expedition against German S.W. Africa. Botha's reply was that he himself would take command of the Union forces and personally command the operations against the Germans. On Oct. 9 Lt.-Col. Solomon G. Maritz, the commander of the Union forces—about 1,600 men—on the German frontier, was in open rebellion; on Oct. 23 de Wet was in rebellion in the Free State, the next day Beyers and Maj. J. Kemp were in rebellion in the Transvaal. The movement was concerted, though the plans for concerted action failed. Of the four rebel leaders named, Maritz was the least important and the only one proved to have been in treasonable relations with the Germans before the World War began. The evidence against Beyers of collusion with the Germans through Maritz after the war had started was conclusive, but there is no evidence that he rose in revolt out of sympathy with them. As one of their ablest leaders in the Anglo-Boer War he enjoyed a great reputation with the Transvaal Boers. Kemp also was known to them as an efficient soldier who had been one of De La Rey's chief lieutenants in the Anglo-Boer War. Kemp was now an officer of the Defence

Force. De Wet was the most famous fighting general of the Free State Boers. All the men named desired to translate into action the policy which Hertzog advocated, and which they believed Steyn approved. In the opinion of a judicial commission<sup>1</sup> which later enquired into the rebellion (whose report was issued in Dec. 1916) Gen. De La Rey plotted a rising as soon as the war broke out. The chief aim was to restore the Dutch republics—if not to establish a completely independent S.A. Republic. At the time it looked as if De La Rey was being dragged into rebellion by Beyers and Kemp. It is certain that they depended upon De La Rey to give the word to the Transvaal burghers to rise. Whether or not through infirmity of purpose when De La Rey was brought to Treurfontein (Aug. 15) to address a meeting of burghers which had been called, in his name, with the intention of immediately starting a revolt instead of the expected words he advised his hearers to remain calm and wait events. De La Rey two days previously had been called to Pretoria by Botha and there had had a prolonged interview with Botha and Smuts who had exhorted him to use his unrivalled influence in the western Transvaal in the interest of peace.<sup>2</sup> And without question the burghers, though mystified, obeyed De La Rey and dispersed quietly to their homes. Then came the public announcement of the expedition against German S.W. Africa and De La Rey went to Cape Town to attend the session of Parliament, of which he was a senator. Meanwhile the Citizen Force of the western Transvaal was gathered at Potchefstroom and Beyers and Kemp arranged with De La Rey that he should return N. and address the burghers in camp on Sept. 15. On the evening of that day, at Pretoria, Beyers announced his resignation. In the morning of the same day he had received a messenger from Maritz who brought word that "all was ready" on the border. De La Rey had reached Johannesburg from the Cape; Maritz's messenger was sent by Beyers to bring him to Pretoria and late in the evening the three set out to go by motor to Potchefstroom. The revolt was to be started the next morning. The way led through Johannesburg and the car was ordered to stop by armed police, who were looking out for a gang of criminals who had escaped in a motor. Beyer's driver disregarded the summons to stop and drove on. The police patrol fired and De La Rey was shot dead. The dramatic death of De La Rey disorganized the conspirators' plans. It deprived them of the one man who could have raised the whole of the western Transvaal against Botha and the one man whose military talents might have matched those of Botha and Smuts. It accounted for the delay in the rebellion, for the interim protestations of loyalty made by Beyers and de Wet's declaration that he wanted to act constitutionally. In de Wet's case there was no evidence that he had been mixed up with Maritz's intrigues with the Germans until after the World War had begun; his was pure discontent with the existing regime.

An illuminating light on the mentality of the rebels was the profound belief that many of them entertained for the "visions" of a certain Nicholas Van Rensburg, a farmer of Lichtenburg, who had served in the Anglo-Boer War under De La Rey, at which time his reputation as a seer was established. Van Rensburg's sincerity was doubted by few—and he seldom professed to understand his own visions, which were of a true Delphic character. One of them was held to foretell the struggle in Europe and to indicate the victory of Germany "the grey bull" which defeated a red bull (England) in bloody combat. Another concerned Gen. De La Rey and with this vision was associated the number 15, which Van Rensburg beheld on a dark cloud from which issued blood. This man's visions and the faith they

<sup>1</sup> Composed of three judges of the Supreme Court, namely J. H. Lange (chairman), M. W. Searle, and F. A. Hutton.

<sup>2</sup> From Gen. Botha's account of the conversation De La Rey appears to have been in a distracted frame of mind. That he wished S.A. to break away from the British Empire and proclaim its independence is beyond question, and he saw in the World War an opportunity to achieve this object. He was very much under the influence of the "prophet" Van Rensburg (see later). By several observers of his conduct at this time De La Rey was believed to be mentally deranged.

inspired among the burghers—and in none more strongly than in De La Rey himself—were cleverly worked upon by the conspirators—it was because of the visions that the Aug. and Sept. meetings were called for the 15th of the month. But the rebellion rested on more solid foundations than visions. As has been stated the moving cause was the desire of the Boers to regain independence, while support for the rebellion was largely gained by the assertions of Beyers and others that there would be no fighting and that Botha was secretly on their side.

News of Maritz's open revolt reached Beyers and Kemp on Oct. 12; two days later de Wet was in conference with Beyers at Pretoria and final plans prepared. But Maritz was crushed before the others could take effective action. General Smuts, as Minister of Defence, had taken over the full direction of affairs from headquarters. Colonel Coen Brits was sent to deal with the traitor and did so effectively; in an engagement at Kakamas on Oct. 24 Maritz's force was broken into small and fugitive bands and he himself compelled to take refuge over the German border. Meanwhile both Botha and Smuts were urgent in their efforts to prevent bloodshed in the Free State and the Transvaal. They turned to ex-President Steyn as the one man whose word could deter the rebels from executing their purpose. On Oct. 11 Botha telegraphed to Steyn—who, in poor health, was living at his farm Onze Rust, near Bloemfontein—informing him of the treason of Maritz, and saying "A word from you will go far." Steyn refused to speak the word. Not that he approved the action of Maritz, but because "I shall have to tell the people that I most strongly disapprove of the policy of the Government respecting an attack upon German W. Africa . . . that as far back as three years ago I warned you against such a policy and that on the outbreak of the European war I had again repeated that warning to Gen. Smuts. . . . As a result of that policy a number of officers and men, who as far as I know were loyal, have become rebels." To this Botha replied that the Government's policy was "not only supported but demanded by the vast majority of the population of the Union," and that, moreover, he possessed proofs that Maritz's plot was formed long before the Government's decision was made. He ended with a moving appeal to Steyn to speak a word "to warn our people against treason, against the everlasting stain that anything of the kind would be upon our national honour, and against the incalculably fatal consequences." No sign in reply came from Onze Rust. On Oct. 22 Botha again wrote to Steyn, informing him of the imminent revolt of de Wet, Beyers and Kemp. In this letter Botha referred feelingly to the outcome of an insurrection "headed by men who in the past have been our honoured leaders" and once more appealed to Steyn to turn those men "from the path of destruction where they now stand." Botha suggested that Steyn should summon de Wet, Beyers and Kemp to a conference at Onze Rust, and now at length Steyn acted. From Oct. 23 onward, and after hostilities had begun he used his efforts to bring the rebel leaders to reason. But only after he had been beaten did Beyers go to Onze Rust, nor was it until he, too, had been defeated that de Wet showed any desire to visit Steyn. The ex-President himself publicly uttered no word. It may here be added that two years later Steyn died and the restraining hand which he had laid upon the extreme manifestations of Dutch racialism was removed. Hertzog, who had not joined the rebels, and had indeed given Steyn some help in trying to induce de Wet and Beyers not to proceed to hostilities, was then free to develop his demand for separation from the Empire.

General Botha delayed operations against Beyers and de Wet as long as there was any possibility of avoiding bloodshed, indeed the Government was sharply criticized for allowing de Wet undisturbed to overrun the northern part of the Free State on pretext of carrying on private negotiations. Rebel activity in the Transvaal at length compelled action and Gen. Botha himself took the field against his old colleagues. If that action finally destroyed his influence with part of the Boers, it won the support of many others and it was one of the disappointments of the rebels that so many

men of their own blood sided with the Government. On Oct. 27 Botha dispersed a rebel commando led by Beyers at Commissie Drift, S. of Rustenburg. Even after this encounter—in which the casualties were two or three men wounded—efforts were made to avoid further fighting, but unavailing. Beyers crossed into the Free State and on Nov. 7 a fight took place at Gruis Drift, on the Vet river, in which some 400 rebels were taken prisoners. It was after this defeat that Beyers, under a safe conduct, sought a belated conference with Steyn, a conference which led to no result. Meanwhile de Wet had been active in the Free State, his burghers freely pillaging all whom they pleased. At Vrede on Oct. 29 he denounced "the ungodly policy of General Botha," the "miserable pestilent English" and described the S.W. expedition as "a dastardly act of robbery." On Nov. 9 he seized Winburg; he had refused to go to Onze Rust to see Steyn. Smuts rightly gauged the mentality of de Wet in stating that unless he were "convinced by force" he would not listen to reason. On Nov. 12 Botha defeated de Wet's main commando, some 2,000 strong, at Mushroom Valley, 18 m. S.E. of Winburg. After this de Wet was willing to go and see Steyn, but the Government was convinced that the time had gone by for the rebels to "extort peace terms" and on Nov. 17 Smuts informed Steyn that now unconditional surrender was required, on the basis of very lenient terms already announced. Pressed by the Government troops de Wet doubled and redoubled and finally, with some 50 followers, turned due W. hoping to make German territory. But he was overtaken about 100 m. W. of Mafeking—his tired horses being no match for the fleet armoured cars chasing him—and surrendered, Dec. 1 (1914) to Col. Brits. A few days later the end came for Beyers. After his visit to Steyn he had rejoined his commando, and after an engagement at Bultfontein on Nov. 16 made N. intending to re-enter the Transvaal. On Dec. 8, in the Hoopstad district, he was once again defeated. With some 25 burghers Beyers reached the Vaal river near Zand Spruit closely pressed by a party under Field-Cornet P. H. de Necker. While the rebels put up a delaying fight, Beyers and one companion tried to cross the river on horseback. When fired upon they dismounted. Their horses managed to gain the further bank, but Beyers and his comrade, though they escaped the bullets, were carried away by the current and drowned. A week later (Dec. 16) the last of the rebel commanders, Fourie, was defeated and he surrendered. The rebellion was over.<sup>1</sup>

Altogether about 10,000 men had been in armed rebellion, while the number of their sympathizers was very considerable. In their ranks were three members of Parliament. The casualties on the Government side were 132 killed and 277 wounded. Of the rebels over 5,700 were either captured or surrendered—their casualties are not known, and many returned home during hostilities under assurances that by so doing they would not be prosecuted. Only one man, Fourie, an officer of the Citizen Force who appears to have deserted while on active service, suffered the last penalty. He was tried by court-martial and shot on Dec. 20. The rest of the rebels were leniently treated. De Wet, in June 1915, was sentenced to six years' imprisonment and a fine of £2,000; Kemp was sentenced to seven years' imprisonment and a fine of £1,000. Others received lesser sentences and few, if any, served their full term; de Wet, for instance, and 118 others were released in Dec. 1915 in time to spend their Christmas at home.

During the insurrection Hertzog's name had been freely coupled with that of the rebels, and in the parliamentary session of 1915 he made himself their advocate. He was no rebel, neither,

<sup>1</sup> Major Kemp had been sent, on Nov. 2, by Beyers on a mission to get arms and ammunition from Maritz. Kemp, who had with him some 800 men, appeared at Kuruman on Nov. 8 where he obtained supplies from the townsfolk. Followed up by loyal forces he made his way to German territory and joined Maritz at the end of November. In Jan. 1915, in company with Maritz, he reappeared, attacked Upington and was defeated. At the same place on Feb. 3, with over 500 men he surrendered to Col. (later Maj.-Gen. Sir) J. L. Van Deventer, while 100 of Maritz's men surrendered at Kakamas. Maritz and his immediate following withdrew to German S.-West Africa. Not wanted there Maritz went to Angola and to Lisbon.

*The Appeal to Mr. Steyn.*

*De Wet captured.*

he maintained, were de Wet, Beyers and their following. Their action was only "an armed protest" against the invasion of German S. West Africa.<sup>1</sup> Nor did Hertzog and his parliamentary supporters modify their attitude; they sought to gain at the polls what the rebels had tried to gain arms in hand. But Gen. Botha had no difficulty in enrolling thousands of Boer volunteers for the campaign in German S. West Africa; the force raised for that purpose was composed almost equally of Dutch and British S. Africans. The campaign ended in the surrender of the Germans on July 9 1915, and on his return home Botha received a triumphal welcome from Boer and Briton alike. Popular feeling against Germany had become intense with the sinking of the "Lusitania," which led to serious riots; in Johannesburg alone damage to German property estimated at £500,000 was done.

After the conquest of German S. W. Africa Nationalist hostility was aroused by the beginning of recruitment for service in Europe. The response to the appeal for volunteers, considering the hostility of the Nationalists, was excellent. First to last the Union (apart from forces used in suppressing the rebellion) raised 146,515 men for service in the World War, and of these over 30,000 served in Europe and 43,000 in E. Africa. These figures refer only to whites. Including the native labour contingents and the coloured combatant corps from the Cape provinces the total personnel of the S.A. forces on war service was 231,591. The casualties numbered 18,642, including 6,606 dead.

None knew better than Gens. Botha and Smuts how deeply they were distrusted by a large section of the Dutch community.

The general election held on Oct. 20 1915, fought on the issues raised by the rebellion, gave a very fair indication of the strength of the Dutch irreconcilables. Botha had appealed to the electors to sink their differences and "see the war through." Out of a total of 130 seats in the House of Assembly the S.A. (Botha's) party gained 54, the Nationalists (Hertzogites) 27 and the Unionist (mainly British) party 40. Labour, out of favour after the industrial upheaval, gained only three seats and there were six Independents (all anti-Hertzogites). Most of the Nationalist members were returned for constituencies situated in the districts where the rebellion had been. The luck of the ballot was with Botha and the Unionists for the figures of the poll showed the Nationalist strength to be greater than the number of seats secured. The figures were: South African party 93,374 votes, Nationalists 78,301, Unionists 48,484, Labour 25,305, Independents 12,029. Some 75% of the electors voted.

As a result of the election Botha was appointed for continuance in office on the support of the Unionists, and this was ungrudgingly given. There was some talk of Sir Thomas Smartt and other leaders of the Unionists joining the Ministry, but this was not done. The cordial support given by the Unionists to Gen. Botha was the more valuable as the Nationalists continued their agitation and increased their demands. Hertzog's efforts were powerless to affect the policy of the Cabinet but they led to increased bitterness in S. Africa. The Government had, nevertheless, no difficulty in securing volunteers for service in German E. Africa. The appointment of Gen. Smuts as commander of the British forces there entailed his absence from the Cape, an absence prolonged by his selection early in 1917 as a member of the Imperial War Cabinet in London. This was a serious loss to Botha in the conduct of home policy.

After Steyn's death (in Nov. 1916) Hertzog became more openly hostile than ever to the imperial connexion. At Stellenbosch in May 1917 he declared that S. Africa's autonomy (*zelfstandigheid*) entitled her to remain neutral in the war and that no real self-government could exist without independence of all other countries, including Great Britain. "The only bond that binds us together," he said, "is our common King but under him we each stand separately and independent of each other." But even "the common bond"

was irksome, and the logical outcome of Hertzog's policy was seen in the adoption by the Nationalist party of republicanism as a plank in their programme, to be achieved "by steady constitutional pressure." The opposite policy was seen that year in operation in London. General Smuts was sitting in the Cabinet with equality of status with that of the ministers of the United Kingdom, and the Imperial War Conference of that year (1917) declared the Dominions to be "autonomous nations of an Imperial Commonwealth with an adequate voice in foreign policy." The adoption of republicanism in the Nationalist platform was strongly resented in the Union and on the motion of Mr. Merriman—who voiced very accurately the feelings of most of the Cape province Dutchmen—a motion condemning republican propaganda was carried (June 18 1917) by 72 votes to 21. The propaganda, however, grew in virulence. There was, said Gen. Botha in 1918, an agitation on foot to establish a republic by violent means.

It will be seen that throughout the World War S.A. had been divided by bitter racial strife. It was not, however, the traditional clash between Briton and Boer, but a combination of Boer and Briton against a section of the Boer community, and this marked an advance on old conditions. Nor were all those who gave Hertzog their votes really prepared to follow him to all lengths. But the defeat of Germany brought no respite in the Nationalist agitation—it rather increased, nor did it require much astuteness for Hertzog to fix upon President Wilson's declarations in favour of self-determination as a weapon. The last half of 1918 was, however, noteworthy in S.A. for other than political happenings. In the influenza epidemic which swept over the world S.A. suffered very severely. Influenza attacked both the white and coloured population and was most severe in the Cape peninsula. A total of 54,899 deaths were registered in Aug.—Dec. 1918. Of these, 11,510 were among whites and of these 6,094 occurred in the Cape province. (There was a recurrence of the epidemic in 1919, but in a milder form.)

As soon as the World War ended Gen. Botha was summoned to London<sup>2</sup> where he joined Gen. Smuts. They represented S.A. throughout the peace negotiations and both were signatories of the Treaty of Versailles, under which S. A. and the other British Dominions became original members of the League of Nations. The counter-measures of the Nationalists failed. No sooner had hostilities ceased than the central committee of their organization sent a note to President Wilson expressing their desire to lay before him their aspiration that the principle of self-determination should be applied as much to the S.A. people as to "other small nations." Mr. Wilson declined to interfere. General Hertzog was at heart most concerned to regain independence for the ex-Dutch republics. Thus in a debate initiated by Sir Thomas Smartt on the republican propaganda in the House of Assembly in Feb. 1919 he maintained the right of the Free State to break away from the Union. At the opening of the session in Jan. one of his henchmen, Mr. Tielman Roos, in the debate on the resolution congratulating King George on the victory of the Allies, had moved an amendment declaring that peace could only be maintained by the "complete application" of the principle of self-determination enunciated by the Allied and Associated Powers. This amendment had been defeated by 73 votes to 20.

Hoping to get some advantage out of the struggle going on around the Peace Conference table in Paris Gen. Hertzog and certain of his colleagues determined to visit Europe. Hertzog held that the question of the Union as a whole becoming a republic was a matter in which Great Britain had no voice, but meanwhile Great Britain might "redress the wrong done to the ex-Dutch republics by restoring to them their freedom." He and his colleagues would lay their case before the Prime Minister, Mr. Lloyd George. When it was announced that a Nationalist deputation would leave for England, trouble arose. The crews of the mail steamers intimated that they would not put to sea if Gen. Hertzog and his colleagues were passengers. This difficulty was met by the offer to bring them over to England in a British

<sup>1</sup> In a proclamation issued by Beyers and de Wet on Oct. 29 1914, they signed themselves "generals of the protesting burghers."

man-of-war. Hertzog, however, realized that that would render him ridiculous; eventually he and his friends sailed in a Dutch vessel to New York, whence they took passage to Europe. They saw Mr. Lloyd George, they visited Paris, and they returned to S.A. unsatisfied. Mr. Lloyd George pointed out to them, among other things, that the restoration of the Dutch republics was not a matter to bring before the Imperial Government; the Union of S.A. was a self-governing state and could speak only through its own constitutionally chosen Ministry.

The Treaty of Versailles having been signed (June 28 1919) Gens. Botha and Smuts returned to S. Africa. A few weeks

later Gen. Botha, whose health had been indifferent for some time, died (Aug. 27) after a very brief illness. In him S.A. lost one of her greatest sons, and the Empire a man who, whether as friend or foe, had been large minded, sincere and whole-hearted. With regard to Botha's successor Lord Buxton, the governor-general, had no hesitation. Gen. Smuts was the inevitable choice. In Sept. at a special session of Parliament, the peace treaty with Germany was debated, and a resolution passed asking King George to ratify it on behalf of the Union. In this debate and on many other occasions Gen. Smuts dwelt on the enhanced position S.A. had acquired as a result of the World War; she had not only become an equal member of the British Commonwealth, with a voice in the direction of its foreign affairs, but a separate entity in the comity of nations. Greater freedom it could not possess; it was mistress of its own destinies, but, so he argued, it was not open to the Union to break away from the British connexion.

The war had ended, economically S.A. had suffered from it less than might have been anticipated, and a period of trade expansion had set in. Smuts, both in generalship and in diplomacy, had been the greatest figure which the British Dominions had thrown up during the conflict. He was presently called upon to get the verdict of his own people on his policy and actions, for by the constitution, another general election was due. It was held in March 1920 in circumstances somewhat unfavourable for the Ministry. Though on imperial questions the Unionist party and the S.A. party held the same views, there were many points on purely domestic issues on which they did not agree and they opposed one another at the polls, often too when a Nationalist was contesting the same seat. There were several triangular and even some quadrilateral contests—caused by Labour candidatures. And the election showed that the Nationalists, determinedly narrow in their outlook—for many back-veld Boers the world outside S.A. counted as nothing—had gained strength. There were 134 seats to be filled as against 130 in 1915. The Nationalists came out the strongest single party with 45 seats; the S.A. party held 40, the Unionists 25, while Labour gained the remarkable number of 21 seats. Three Independents completed the list. The Nationalists were jubilant and with the help of the Labour members hoped for great things. Gen. Smuts was in a difficult position but he resolved to meet Parliament and carry on the Government. This could only be done with the help of the Unionists—and that help was given to Smuts as freely as it had been given to Botha. Even so, the margin of votes was exceedingly small and would have disappeared had not several of the Labour members on the main issues also supported the Ministry. As it was Smuts went through the session with remarkable skill and succeeded in passing more than one important measure—among others the Native Administration Act (*see above*).

The evidence that the election had afforded of the strength of the Nationalists could not however be ignored, nor was it possible that in the existing state of parties Parliament could continue to do its work efficiently or the country be at peace. Some way out must be found. Considering his race, it is not a matter for wonder that Smuts tried first to see if an accommodation could be reached with the Nationalists. A reunited party which would have the support of the whole Dutch community was a tempting prospect. Negotiations went on for some time; finally in Sept. 1920 a *hereeniging* (re-

*Hereeniging Efforts.*

union) conference was held at Bloemfontein. It failed, and its failure might have been foreseen. On various points the Nationalists or the S.A. party were prepared for compromise, but when the test came it was seen that there was no bridging the gulf which separated them on essentials. Gen. Smuts and his party held firm to the principles of the unity of the Union and the preservation of the ties which linked the Union to the Empire. The Nationalists, on their side, refused to abandon the republican plank in their platform.

Gen. Smuts consequently turned for support elsewhere. In a manifesto issued on Sept. 29 and addressed to "all right minded S. Africans, irrespective of race or party" he asked them "to join a new party which shall be strong enough to safeguard the permanent interests of the Union against the disruptive and destructive policy of the Nationalists." This was an open bid to the Unionists, nor were they indisposed to respond. Their fundamental principles were those of Gen. Smuts and his followers. But when at the conference of the S.A. party, held on Oct. 27, a resolution was adopted directing the head committee of the organization to take the necessary steps not for the creation of a new party, but for "an expansion of the S.A. party," some difficulty was created. The Unionists, who represented the bulk of the British section of the community, had, though with natural regret, been prepared to make a new combination, but they disliked the idea of simple absorption into a predominantly Dutch organization. These feelings were expressed at the Unionist party conference at Bloemfontein early in November. Counsels of patriotism prevailed and at a meeting between the Unionist executive and Gen. Smuts at Johannesburg on Nov. 27, a complete agreement was reached. The Unionists joined the S.A. party, which retained its name. Nor was it an unfitting title, though it would become meaningless if the fusion of the two races came about, and the old distinction between Boer and Briton obliterated. This possibility was precisely what the Nationalists (and also a few British extremists) most dreaded while it was the goal to which Smuts looked forward. Speaking in London on May 22 1917, he had declared "we want to create a blend out of various nationalities. We want to create a new nation and that is the South African nation. . . I am hopeful that . . . we shall in the end succeed and create under our South African sun a new type in the world."

Having drawn together the supporters of "national unity of the European races and the economic development of S.A. along peaceful lines" Gen. Smuts made a new appeal to the country, backed by the whole strength of what had been the Unionist party. Smuts fought the election on the republican issue. With the alternative thus nakedly put the Nationalists took alarm. They knew that success for them on such an issue was impossible and therefore they tried to confuse the people, and snatch a victory on other grounds. Severance from the British Empire, the turning of the Union into a republic, was not, they declared, their immediate object, rather was it an ideal which they hoped to attain in a remote future. This manoeuvre deceived no one. Even if the Nationalists did not ardently desire a complete rupture with Great Britain they did want to secure at once complete ascendancy in the ex-Boer Republics. During the election campaign Hertzog was induced to put the case baldly. Heckled at a meeting at Roodebank in the Standerton district he said that "even today (1921) he would accept a republic in the Transvaal and Free State and those Englishmen who objected might retain their British citizenship. If they had any grievances they would be represented by a British diplomatic agent." He admitted that if his wish were granted and difficulties arose the country would be in exactly the same position as before the Boer War.

The election was held in Feb. 1921 and resulted in a notable triumph for Gen. Smuts and the enlarged S.A. party. But it was significant that the Nationalist vote increased and that on balance of losses and gains they held two more seats in the new than they had held in the old Parliament. The distribution of parties was as follows:—South African 76, Nationalist 47, Labour 10, In-

*The 1921 Election.*

dependent.<sup>1</sup> The 76 seats held by the S.A. party compared with 40 in the old S.A. party and 25 in the old Unionist party. The gains of the enlarged party had been at the expense of the Labour candidates. But an analysis of the poll showed that Smuts had rallied to his side many doubtful voters besides those transferred from Labour. Nor could the Nationalists claim that those who voted for Labour candidates favoured their propaganda; there were in the Transvaal bitter contests between Nationalist and Labour candidates. In considering the figures of the votes cast it should be remembered that nine S.A. party candidates were returned unopposed, whereas only one Nationalist (Gen. Hertzog himself) was not opposed. It is also noteworthy that the Nationalists' successes were almost entirely in rural and remote constituencies, decisive evidence that their strength lay in the back-veld Boers. The figures were: S.A. party 138,942 (an increase of 19,455 compared with 1920), Nationalists 104,692 (an increase of over 8,000), Labour 28,983 (a decrease of over 12,000).

Following upon the election there was a reorganization of the Cabinet in which Sir Thos. Smarrt became Minister for Agriculture, Mr. Patrick Duncan Minister for the Interior, and Mr. J. W. Jagger Minister for Railways and Harbours. Another leader of the late Unionist party, Sir Edgar Walton, was appointed High Commissioner in London. In June 1921 Gen. Smuts, Sir T. Smarrt and Col. H. Mentz (Minister of Defence) came to London to attend the Imperial Conference. In regard to matters affecting the internal affairs of S.A. the most delicate question discussed by the conference was the status of British Indians (see above). While the ministers were still in London the question of the future of Rhodesia advanced a stage. A deputation had been invited to discuss with the Colonial Office a plan for ascertaining whether Rhodesia was prepared to take a referendum upon a definite scheme of self-government (see RHODESIA). Largely however as the result of the general election in the Union in Feb. 1921 the party in Rhodesia which preferred to join the Union had again grown in strength. The Rhodesian deputation saw Gen. Smuts early in Sept., immediately after his return to Cape Town, when it was made clear that though the admission of Rhodesia as a province of the Union would be welcomed, it was a matter for the Rhodesians to decide.

In the 1921 election campaign the Nationalists sought to evade the main issue partly by assailing the policy of the Government on native affairs. That policy has already been outlined; by Nationalist orators addressing the back-veld Boer the conciliatory measures adopted were denounced as "cooperating with niggers"; by Nationalist orators addressing audiences in the Cape province—where the native had the vote—the segregation clauses of the Act of 1920 were denounced as evidence of the bias of the Government against the Kaffirs. This method of electioneering had elements of danger, for discontent among considerable sections of the natives was pronounced. The chief ground of complaint was in regard to their economic position. The natives had been quick to learn the lesson of the strikes of white labour on the Rand and in 1917 and subsequent years there had been strikes and native disturbances at Johannesburg and other cities. There were also many evidences of political and religious ferment. Serious disturbances at the Lovedale missionary institute in April 1920<sup>2</sup> were followed on Oct. 23 of the same year by a disastrous collision at Port Elizabeth. In the last-named case the native labourers had struck for higher wages and their leader, Masabalala, president of the Native Workers Union, had been arrested and refused bail. An angry crowd gathered before the court house and fire was opened upon it by the Europeans who feared an

attack. Rioting and incendiarism ensued and for a time it looked as if Port Elizabeth would be at the mercy of the natives. In all over 20 persons (including one European) were killed and 40 injured. The action of the natives was condemned by many of their leaders, such as Dr. Rubusana, an ex-member of the Cape provincial council and by Mr. Jabavu,<sup>3</sup> a graduate of London University, who, while calling for the remedy of grievances, denounced the "Bolshevist propaganda" permeating the native mind. An investigation made by a commission appointed by the Government tended to show that the authorities at Port Elizabeth had mishandled the affair, and that bloodshed might have been avoided had Masabalala been granted bail. It was a cause for angry recriminations later when Nationalist candidates for Parliament appeared on the same platform as Masabalala.

A greater tragedy followed at Bulhoek, near Queenstown on May 24 1921. For months several hundreds of natives known as Israelites, proselytes of one Enoch Ngijima, who gave himself out as the prophet Enoch, had been allowed to remain at Bulhoek and they had become a menace to the community. Whether or not earlier action might have averted the calamity is not certain; in this case the Government acted with great forbearance. But at length it became imperative that the Israelites should be compelled to return to their homes, and forces were moved to Bulhoek to be in readiness for eventualities. Enoch proved intractable and his followers proved themselves possessed of all the fanaticism of dervishes. On May 24, when preparations were being made for their removal, large numbers of them, though destitute of firearms, charged the troops, and some 400 were killed or wounded before their ranks wavered and broke. On this occasion the soldiers had no option but to fire; the Israelites, though their reckless charge exhibited only fanaticism, had also shown military skill and had dug trenches and prepared ambushes for the troops. Their dispersal was a necessity. Neither did responsible native leaders approve Enoch's teachings.

The Bulhoek tragedy was, however, regarded by the leaders of the natives as the outcome of unjust economic laws. The case against the Government was put by Mr. Selby Maimang, the president of the Industrial Commercial Workers Union—a union which embraced nearly all the native and coloured trade organizations in South Africa—at its meeting at Cape Town in July 1921. Mr. Maimang said that the land laws of the country were to blame for the catastrophe. Enoch's following had fallen victims to bad influences brought about by bad administration. Coloured workers were smarting under irritating disabilities in every walk of life. Mr. Maimang, a representative of moderate opinion among the natives, rebuked the useless stirring up of passions, declaring it to be the duty of the Union to educate all non-European workers to guard their own interests. Organization was essential; they could only ward themselves against exploitation by a distinct band of comradeship. As to that many European employers were already convinced that combination among the natives engaged in industries was a factor which they could not ignore.

The decline in trade which became noticeable in the middle of 1920, and was acute in the first half of 1921, added to the difficulties of the industrial problem. It affected both white and coloured labour severely and caused renewed agitation on the Rand, while diamond mining came almost to a standstill.

Lord Buxton's tenure of the office of governor-general and high commissioner came to an end in 1920. In very difficult circumstances he had carried out his duties with firmness and in a manner which won the esteem of all classes, including the Nationalists. He identified himself with the interests of S. Africa. On giving up office he was granted an earldom (Oct. 21 1920), and on his return home served as chairman of the committee appointed to inquire into the future government of Rhodesia. Prince Arthur of Connaught was chosen as the new governor-general and high commissioner. He reached the Cape on Nov. 17—seven years after his father, the Duke of Connaught, had opened the first session of the Union Parliament.

<sup>1</sup> Son of Tengo Jabavu (d. 1921), editor of *Imvo (zi Bantu)*, an influential native newspaper, which he had founded in 1884.

<sup>1</sup> These figures include the results of recounts and of two by-elections in the Transvaal, necessitated by ties in the voting at the general election. At two by-elections for Cape Town constituencies in Sept. 1921 Labour candidates won, bringing the Labour members of Parliament to 12 and reducing the S.A. Party to 7.

<sup>2</sup> The students attempted to burn down the college buildings and murder the professors. The rioting began with complaints as to the quality of the bread served, which was the same for whites and blacks.

**AUTHORITIES:** (a) *Official.* The *Official Year Book of the Union*, prepared by the Union census and statistics department is a valuable record and contains sections relating to state archives and official publications and a classified bibliography. The Colonial Office, London, publishes annual reports on all parliamentary papers. The *Colonial Office List* (yearly) gives lists of all parliamentary papers. The Government of India issues reports concerning Indians in S.A. (see especially *Statement made by Sir B. Robertson before the Asiatic Enquiry Commission* (1921), a survey of the whole question).

#### DEFENCE AND MILITARY INSTITUTIONS

The establishment of union in S. Africa in the year 1910 involved a fusion of the different military systems then obtaining in the four colonies which became original Constituent Provinces in the new amalgamation. These systems were as follows. The Cape Colony maintained a permanent force (the Cape Mounted Riflemen) together with a volunteer force and a cadet organization. The forces of Natal consisted of a military force, of much the same strength (3,000-4,000 men) and character as the volunteer force of the Cape and a reserve organized in rifle clubs, and included cadets again on much the same lines as those of the kindred organization in the Cape Colony. The two forces contained regiments of long standing and high reputation gained in many local campaigns and embraced all arms. These regiments retained their identity in the new forces. A volunteer force on modern lines, confined to the towns, except for two mounted regiments recruited from country districts, was the form of military organization which had been adopted by the Transvaal. This force, however, had only been in existence for seven or eight years at the date of union. In the same period an efficient cadet system had been instituted. In each of these three colonies a small permanent staff was maintained. The Orange Free State relied upon the burgher system based on universal male liability for service in time of war, a principle accepted indeed by all the four colonies, and reaffirmed in the present S. Africa Defence Act.

It was not until June 14 1912 that it was found possible to pass a law embodying the recommendations which had been made and the conclusions which had been arrived at after investigation, but upon this date the S. Africa Defence Act, 1912, was placed on the statute book. Field-Marshal Lord Methuen, then commander-in-chief of the British forces in S. Africa, evinced great interest in the matter of South African defence and assisted the local military authorities in the conferences and

deliberations which preceded the passing of the Act. By this Act every citizen between 17 and 60 (both included) is liable to render personal service in time of war in defence of the Union "in any part of South Africa." A permanent force is provided for, but in May 1921 an amending bill was before the House of Assembly, which if accepted would materially alter the composition and functions of this force.

Every citizen is liable to undergo, beginning in his twenty-first year, four years "peace training" in the Active Citizen Force, which constitutes the first line of defence. It is however permissible for any citizen to enter voluntarily for his "peace training" in any year between his 17th and 21st years (both included). The number of citizens to be trained in the Active Citizen Force is placed in the Act at 50% of the total number liable, but Parliament has power to increase this number. If the number required for training in any district is greater than that of its voluntary entries, a ballot may be taken to make good the shortage. After four years' "peace training" in the Active Citizen Force the citizen goes to Class A of the Citizen Force Reserve where he remains until his 45th year. A Coast Garrison Force is established, and service may be undertaken in that force as equivalent to Active Citizen Force "peace training." A similar concession is allowed to citizens who may elect to serve in the Royal Naval Volunteer Reserve which is part of the Royal Naval Reserve constituted under the Naval Forces Act 1903 (Great Britain and Ireland) and may be placed at the disposal of the Royal Naval authorities. Any citizen who at 21 has not been entered for service in the Active Citizen Force (or one of its equivalents) is compelled to serve for four years in a Rifle Association where he is taught to be "familiar with the use of military weapons of precision," after which he is included in Class B. of the Citizen Force Reserve until his 45th year. Cadet service is compulsory, but a request from a parent or guardian that a boy "be exempt from cadet training" secures a certificate of exemption. Several special reserves are provided for in the Act, and one of these, the Veteran Reserve, was largely used in establishments within the Union during the period 1914-8. The National Reserve consists of all citizens who, liable to render personal service in time of war, do not belong to any other portion of the forces. The full establishments of the Active Citizen Force in 1914 represented a force of approximately 30,000 men. The periods of "peace training" are not more than 30 days in the first year and 21 days in each subsequent year with a maximum of continuous training (in camp) of 22 and 15 days respectively.

The response to the first year's (1913) call for entries was striking, and 44,193 citizens entered voluntarily for training, producing a strength of 14,000 in excess of requirements. The following year saw the outbreak of the World War, and the annual registration in Jan. of all citizens who reach the age of 17 in the year has been in abeyance since Jan. 1914.

Immediately after the passage of the Defence Act in 1912 steps were taken to establish the military system for which it provided. The permanent force at its inception consisted of two portions. The staff was employed partly at defence headquarters and partly distributed in the 15 military districts of the Union. The South African Mounted Riflemen (five regiments and three batteries of field artillery) was, with the exception of the artillery, employed solely on police work, and divided into very small detachments on posts. The whole of the police force had in May 1921 been placed under the command of the commissioner of police, and the new military arrangements proposed in 1921 contemplated a reduced permanent force employed on military duties alone.<sup>1</sup>

The complications introduced by the rebellion made it impossible to call out the whole of the citizen forces in the formations in which they strictly belonged, and, though a considerable number of units of the Active Citizen Force were called out by proclamation in the regular way, most of the Dutch members of the forces—many of whom were beyond the age of those in the Active Citizen Force—were specially embodied under the old commando system to which they had been formerly accustomed. Thus the whole of the Dutch-speaking units serving under Gen. Botha in the rebellion and German S. W. Africa were organized on a commando basis, the English speaking units being those of the Active Citizen Force. In the rebellion 30,000 troops (of whom 20,000 were of Dutch descent) were employed at a cost of £5,100,000 to the Union Government, and casualties to the extent of 132 killed and 242 wounded were sustained by the loyal troops. In German S.W. Africa 67,237 Union troops were engaged at an approximate cost of £15,000,000 and 127 lives were lost, the wounded amounting to 272.

<sup>1</sup> The S. African Mounted Riflemen, as a brigade, served in the rebellion of 1914, and at the close of the campaign in German S.W. Africa, but thereafter were retained in the Union, though many individual members of the force served with credit and distinction on many battle fronts.

At the conclusion of the campaign in German S.W. Africa the Union Government turned its attention to other fields in which assistance was needed. These were oversea, and the liability of S. African citizens to military service did not extend to such distant spheres of activity. It was thus necessary to devise special measures to furnish troops composed of S. Africans who were prepared of their free will to serve beyond the limits of S. Africa.

In July 1915 the Imperial Government accepted the offer of the Union Government to furnish personnel for units for service beyond S. Africa. A director of war recruiting was appointed and recruiting was maintained until the Armistice in 1918. The following are the numbers of all the forces which were raised in the Union for the different campaigns in which South African troops took part:—

The rebellion	30,000
German S.W. Africa	67,237
Overseas (France)	30,880
German E. & Central Africa	47,521
For service in the Union	5,180

The achievements of the S. Africans in France and their fortitude under hardship in the East African campaign are matters of history.

The coloured community in the Cape province had early expressed a strong desire to furnish a representative body of troops, and an infantry battalion of the Cape Corps was formed, and later a second battalion was recruited. The regiment after gaining valuable experience in E. and Central Africa was sent as one battalion to Egypt and Palestine, where it served with credit. The natives of the Union, who throughout the war maintained an attitude of complete self-control and loyalty, furnished for non-combatant duties 35,000 men for German S.W. Africa, 10,600 for France and 18,000 for E. and Central Africa. Some hundreds of natives lost their lives in the transport "Mendi" which was sunk in the English Channel.

While, as a consequence of the large number of men who, especially at the outset of the war, joined the British forces as individuals, a full statement of the casualties sustained by S. Africa in the World War is not available, the following figures give some idea of the incidence of losses. In the S. African Infantry Brigade in France nearly 15,000 casualties were sustained, of which some 5,000 were killed. In the Cape Corps which served in E. Africa, Egypt and Palestine, the casualties in dead and wounded totalled 701. Disease and privation took heavy toll in East Africa and hundreds of men returned to the Union from the campaign in that country shattered in health. The Royal Naval Volunteer Reserve supplied and maintained a strong detachment for service in the Grand Fleet and naval establishments. Hospitals, camps, supply and ordnance depots, and veterinary hospitals were formed in S. Africa under Union control, and heavy purchases were made and vast amounts of supplies were forwarded to E. Africa under Union military supervision on behalf of the Imperial Government.

As regards the future military arrangements of the Union the main provisions of the Act of 1912 have been accepted as sound, though methods will doubtless be reformed to a considerable extent. An amending defence bill in May 1921, in addition to important changes in the constitution and functions of the permanent force, provided for a resumption of registration, with retrospective effect as regards citizens who should have been registered in and since 1918; also for the working of the normal training system in 1922, and for a substantial increase in the period of continuous "peace training," as well as for increasing cadet efficiency, by additional expenditure of public funds and by extending the age for cadet service. The bill was, however, dropped in June 1921. (J. J. C.)

**SOUTH CAROLINA** (see 25.499\*).—The pop. of the state in 1920 was 1,683,724, an increase of 11.1% over the previous decade, as compared with 13.1% and 16.4% during the two preceding decades. During the decade 1910–20 negroes increased from 679,161 to 818,538, or from 44.8% of the total pop. to 48.6%. The density was 55.2 per sq. mile. The urban pop. was 17.5% of the whole, as compared with 14.8% in 1910. The pop. of Charleston was 67,957 and the decennial increase 15.5%, the white increase being 23.3% and the negro 4%. The white pop., increased by war industries, was 52.4% of the whole, con-

stituting a majority for the first time in about 200 years. The pop. and decennial increase for the other leading cities were as follows:—

	1920	1910	Increase per cent
Columbia	37,524	26,319	42.6
Greenville	23,127	15,741	46.9
Spartanburg	22,638	17,517	29.2
Florence	10,968	7,057	55.7
Anderson	10,579	9,654	9.5
Sumter	9,508	8,109	17.3

**Manufactures.**—Textile mills paid very large dividends during 1917–20, and in addition doubled or trebled their capital. Wages rose greatly, but were cut 30 to 50% in the depression of 1920–1. The number of spindles in 1918 was 4,914,524; of operatives in 1919, 50,898, a decrease of about 4,000 since 1916; the bales of cotton consumed diminished from 972,000 in 1916 to 779,000 in 1918–9; capitalization that year was \$201,237,320. Almost half the motive power in 1920 was hydro-electric. Unionization has not proceeded far among textile workers, though skilled trades in larger places are generally organized. The State Board of Conciliation, created in 1916, arbitrates labour disputes on invitation or investigates them on its own motion or the order of the governor. Women are forbidden to work in stores after 10 P.M. or over 12 hours in one day.

**Agriculture.**—The coincidence of the World War and a large cotton crop in 1914 demoralized farming. A law was passed forbidding the planting of more than a third of a farm's acreage in cotton, but was repealed before the next planting season. An enormous inflation of values soon followed and in turn was succeeded by a decline of prices from about \$0.40 to \$0.10 or \$0.11 in six months (1920–1), entailing great hardship. Legislation (1912) sought to stabilize agricultural prices by a system of state warehouses for holding products for a favourable market. Private capital has been extensively invested to the same end. The boll weevil became a serious menace in 1920 in the south-western counties. A packing plant with a daily capacity of 400 hogs was established in Orangeburg. Butter-making in co-operative creameries has made some progress. Under the law of 1920 extensive drainage projects were undertaken. Agricultural methods have improved; farm-houses are better; banks, which have increased in number and capital, finance the farmer directly at greatly lower cost than formerly charged by "lien merchants." South Carolina led all the states in 1917 in crop value per acre with an average of \$63. The value in 1918 was \$75. According to state Government estimate cotton covered in 1920 45% of the cultivated acreage and represented 50% of the value of the 13 leading crops. One million five hundred and thirty thousand bales were raised, the state's acreage being fourth and its production second in the Union. Corn, second in value, amounted to 42,370,000 bushels. Other crops were: tobacco 66,950,000 lb.; rice 120,000 bus.; sorghum 1,500,000 gal.; peanuts 1,620,000 bushels. The average value of ploughed land was \$61 per acre as against \$91 for the United States. Average monthly wages for adult male farm labour without board were \$41.80, next to the lowest for any state. During 1919–20 the number of farms increased from 176,434 to 192,693; improved land from 6,097,999 ac. to 6,184,159 ac.; average value per farm from \$2,223 to \$4,046; average value per acre from \$20.02 to \$76.70.

**Education.**—School legislation since 1910 included an Act for compulsory school attendance in 1919 throughout the state, increased state additions to local funds, calculated to ensure after 1920 a seven-months' term in the poorest districts; night schools for adults; consolidation and grading of rural schools, with transportation for children; an increased number of high schools; special teachers and inspectors in rural and textile districts; greatly improved school buildings; enlarged facilities for agricultural, vocational and home economics training; state standard certification of teachers and enforcement of payment for tuition at state colleges by those able to pay. The most significant principle underlying the forward movement in education has been the recognition of the necessity of greater assistance from state funds and greater power in the state authorities as distinguished from the local divisions. Difficulties have been the lack of competent teachers to carry out the enlarged programme and maintain the higher standards, the shortness of the rural school term, and excessive local authority to do or neglect to do what it pleases. The expenditure on common schools in 1918–9 exceeded \$8,000,000. Attendance in common schools in 1919–20 for whites was 226,065; for negroes, 251,980; total 478,045. There were in that year enrolled in the 36 colleges in the state 12,000 students, of whom a third were negroes.

The three most numerous religious denominations, the Baptist, Methodist and Presbyterian, have added materially during 1910–20 to their extensive work in higher education. All but 11 of the 36 institutions for higher education in the state were in 1920 under church control, and these institutions contained a thousand more students than all state and other non-sectarian institutions combined.

**Social Legislation.**—Every attempt of forces of reaction to abandon a step in the large number of forward moves in social legislation since 1910 has been defeated, usually overwhelmingly.

\* These figures indicate the volume and page number of the previous article.

In 1912 race gambling was forbidden. In 1913 the penitentiary hosiery mill was abolished as harmful to the health of the prisoners. The State Board of Charities and Corrections, created in 1915, was reorganized in 1920 as the State Board of Public Welfare. The state hospital for the insane was entirely remade, materially and administratively, during 1915-9. A school for the feeble-minded was established in 1918. The placing of orphans and homeless children was taken over by the state in 1920. In 1918 the Industrial School for Girls, a reformatory institution for white girls, was established and the reformatory for negro boys was reorganized. The probate judge in each county is constituted a juvenile court, and several cities have undertaken remedial work for juvenile delinquents and dependents. Penal and charitable institutions (including church and private charitable institutions) have been since 1915 under state inspection. Since 1918 diseased women prisoners of all classes are held until cured. The age of consent was raised in 1921 to 16 years. No city has acted upon the permission in 1915 to segregate whites and negroes by city blocks. Marriage licences were required by law in 1911 and registration of births and deaths in 1914. Medical inspection of school children was made state-wide in 1920.

**Finance.**—The budget system, concentrating responsibility on the governor and the chairmen of the two legislative finance committees, adopted in 1919, has tended to economy and system, though the Legislature may disregard without any limitation the recommendations. The State Tax Commission, created in 1915, has improved the administration of the tax laws. The assessed taxable value of all property in 1920 was \$448,222,786, being from a fourth to a third of the market value. For the state government there was raised a revenue of approximately \$6,000,000; for county governments \$12,000,000; for common schools (local tax) \$8,000,000; and for municipal government between \$5,000,000 and \$6,000,000.

**Political History.**—The class feeling that has always been strong in South Carolina politics found violent manifestation during the governorship of Coleman L. Blease, who served two terms from 1911 to 1915. Blease's political tactics were calculated to appeal to the lower and less literate elements of the state; he quarrelled with the state Supreme Court, with the General Assembly, with other state officers and with the U.S. authorities. The Legislature was at all times controlled by his opponents, and probably more measures were passed over his veto than had been so passed in the case of all former governors combined. He startled a congress of governors at Richmond, Va., in 1912 by an open advocacy of lynching, and while governor he pardoned or paroled more than 1,500 criminals. At the time of his resignation (a few days before his term expired in 1915) he had freed all but 150 convicts, the number then said to be remaining in the institutions of the state. Almost his last official act was an order disbanding the state militia; this was promptly countermanded by his successor. Resigning without giving any explanation, he was succeeded for five days by Lt.-Gov. C. A. Smith. In 1918 Mr. Blease made a campaign for election to the U.S. Senate, taking extreme ground against the country's entering the war. He was overwhelmingly defeated. A progressive period began with the election of Gov. Richard I. Manning in 1914. A significant feature of the campaign was the support given to Prof. John G. Clinkscales in his advocacy of compulsory education. Gov. Manning's two administrations were marked by constructive legislation and effective cooperation with the national Government. Gov. Robert A. Cooper was elected in 1918 on a platform that made education its chief plank and frankly announced that as the result of progressive legislation taxes would be higher. He was reelected without opposition in 1920. His chief measures were the strengthening of the public schools, the creation of a budget system and the consolidation of management of charitable and correctional institutions. The Australian ballot was put in force (1921) in primaries, though not in the general election, the latter being merely a formal ratification of the former as the Democratic nomination is equivalent to election.

**The World War.**—Of the total of 78 Congressional Medals of Honour awarded, South Carolina received six. The total number of men sent by South Carolina into the war was 54,254, not including those who had enlisted before the United States declared war. The amount of Liberty and Victory loans and other Government securities bought was \$94,211,244, and \$3,027,740 was contributed to Red Cross and similar appeals.

**BIBLIOGRAPHY.**—Snowden (editor), *History of South Carolina* (5 vols. 1920); *Reports of S.C. Superintendent of Education, Treas-*

*urer, Comptroller-General and Commissioner of Agriculture, Commerce and Industries; S.C. Statutes at large.* (D. D. W.)

**SOUTH DAKOTA** (see 25,506).—The pop. of the state in 1920 was 636,547, as compared with 583,888 in 1910, an increase of 52,659, or a little more than 9%. The average density in 1920 was 8.3 per sq. mile. The rural pop. was 84% of the whole in 1920, against 86-8% in 1910, an increase of 27,460, or 5.4%. The urban pop. (cities with 2,500 inhabitants and over) was 101,872 in 1920 against 76,673 in 1910, an increase of 25,199, or nearly 33%. The pop. of Sioux Falls increased 79.7% to 25,176 in 1920. Its rapid growth is due largely to the opening of extensive packing plants, stock yards and factories. Aberdeen in 1920 had 14,537 inhabitants; Watertown, 9,400; Mitchell, 8,478; Huron, 8,302; Rapid City, 5,777; Yankton, 5,024; Lead, 5,013; and Pierre, the state capital, 3,200. The foreign-born white pop. in 1920 was 82,372, of which 16,807 were Norwegians, 8,569 Swedes, 5,983 Danes, 15,670 Germans, 11,191 Russians, 4,453 Canadians, 2,943 British.

**Communications.**—A panoramic picture of the surface of the state in 1921 would present many changes from one in 1910, but both pictures would have the appearance of a chess-board, of which the country roads, running a mile apart from E. to W. and from S. to N., would mark the squares. In the hills, near river beds, in the bad lands, and in uncultivated and thinly populated portions, the roads are not uniformly maintained. The law provides that they be 66 ft. in width. Each square mile of land is called a section and contains, including one-half of the roads on the four sides, 640 ac. of land. The roads are still for the most part dirt roads. During the decade 1910-20 they were considerably improved by grading and elevating the centre. All of the 64 counties either have been actually engaged in the building of hard-surfaced roads or have started preparations for doing so. Advantage is taken of the Federal appropriations for highway purpose of which South Dakota's share was \$4,458,545. State and county have made heavy assessments. Over \$6,000,000 has been spent in building hard-surfaced roads. The state Legislature appropriated \$2,000,000 for the construction, in 1921, at Rapid City, of a cement plant with a daily capacity of 2,000 barrels. A system of state trunk highways is supposed to connect all county seats and all towns having a pop. of 750 and more. A law provides that every county must employ a county engineer whose occupation is the planning of better highways. The automobile, the truck and the tractor have become more common than horsed vehicles, and have awakened the farmers to the advantage of good roads; 117,320 automobiles, enough to carry comfortably all the inhabitants of the state at one time were licensed in 1920. In connexion with the improvement of the roads, mention should be made of the bridge which was being built in 1921, at a cost of \$1,500,000 across the Missouri river at Yankton, and which supplies the last connecting link of the Meridian Highway which crosses the state and extends from Winnipeg, Canada, to the Gulf of Mexico. Only about 300 m. of railway were built during the 10 years, 1910-20.

**Agriculture.**—There were 74,637 farmers in 1920, of whom 47,815 were owners, 26,041 renters and 781 managers. Many owners of the rented farms either lived on their farms or in the neighbouring towns, having rented to their prospective heirs. Though there were 74,637 farmers to 76,868 sq. m. of land, it is not the case that the great majority of the farmers occupied on an average a sq. m. of land each. All of the land area was not under cultivation; and among those who occupy the 34,636,491 ac. of agricultural lands outside of the corporate limits, the great majority of the farmers have each much less than the average, which is 454 acres. A minority, mostly west of the Missouri river, operate the large farms.

The farmers prospered during the 10 years, 1910-20. Their prosperity was evident in many other respects than the improvement of the highways and the large number of automobiles, trucks and tractors. Farm life underwent a rapid change. Electricity, telephones, rural mail delivery and consolidated school-houses added to the comforts and education of the people. Farm machinery was improved and bodily labour decreased. Many of the counties employ county agents, who are supposed to be highly trained agricultural experts. Because of the introduction of scientific methods, farm crops have become more varied and rotation of crops has become possible. The corn acreage in 1920 surpassed the wheat acreage, and the production of other grains and grasses increased. The introduction of alfalfa was especially noteworthy. Alfalfa was harvested three and four times a year. As a result, and also because of the large use of the silo, much more stock has been raised and more dairy products and eggs sent to market. The breeds of cattle, horses, hogs and poultry have been improved and many farmers raise only pure-blooded stock. A much greater number of farmers, as well as of city people, were in 1921 raising their own vegetables and fruits. Orchards and groves have increased in number and area. Because of many clusters of trees the unbroken prairie-like appearance of the farms has been modified. Farm values have more than doubled and the use of improved farm equipment has become much more exten-

sive. There were not only many more farmers in 1921 than in 1910, but the investment per acre was much greater. The homes, barns, stables and granaries more recently erected are usually well built, are much larger than those of the past and have modern conveniences. Practically all of the towns with a population of 2,500 have their own electric light plants. The Homestake Mining Co. has a power plant costing about \$2,000,000. The 1919 Legislature provided for an hydro-electric commission and appropriated \$50,000 for the purpose of surveying the Missouri river to find water power. The engineers found three sites—Moberg, Mulchard, and Medicine Butte—to be advantageous, in the order named. The commission presented a report to the 1921 Legislature and recommended that the Moberg site be developed. It estimated that the dam and plant would cost \$9,400,000 and the transmission system \$7,833,000. Under the economic conditions existing in 1921 the Legislature hesitated to act favorably and the question was to be submitted to the people in the election of Nov. 1922. The following table shows the increase of farm products:—

		Acreage	Production	Value
Corn.	1910	2,756,234	66,060,782 bu.	\$89,779,016
"	1909	2,037,058	55,558,737 "	26,395,985
Wheat	1910	3,891,468	31,086,995 "	69,233,996
"	1909	3,217,255	47,054,590 "	42,878,223
Oats	1910	1,839,089	51,091,904 "	38,318,937
"	1909	1,558,643	43,565,676 "	16,044,785
Barley	1910	751,929	12,815,768 "	15,378,922
"	1909	1,114,531	22,396,130 "	10,873,522
Rye	1910	463,132	4,111,543 "	5,961,741
"	1909	13,778	194,672 "	115,126
Flaxseed	1910	159,234	1,109,303 "	4,880,931
"	1909	518,566	4,759,794 "	7,001,717
Potatoes	1910	58,180	2,863,186 "	7,157,983
"	1909	50,552	3,441,692 "	1,967,550
Hay and forage	1910	5,071,747	4,996,846 tons	71,988,845
"	1909	3,435,907	3,651,706 "	15,247,570

In 1919 receipts for the sale of dairy products were \$12,222,562; of chickens, \$1,477,500. The total value of domestic animals on farms was \$232,364,625.

**Minerals.**—The value of the minerals produced in the state in 1910 was \$5,500,000. Prof. Freeman Ward, state geologist, has computed the mineral products in yearly averages for the five-year periods, 1905-9 and 1915-9, as follows:—

	1905-9	1915-9
Bentonite		\$5,480
Coal	\$4,000	23,500
Copper	2,200	3,000
Gold	6,000,000	6,600,000
Gypsum	10,000	45,000
Lithia	1,000	38,680
Myca	50,000	10,400
Natural gas	18,120	19,000
Silver	97,900	126,000
Stone		
Crushed	23,480	80,000
Limestone	15,000	31,140
Sandstone	140,000	109,000
Structural materials	371,800	310,400

**Mainufactures.**—The following table indicates the growth of manufactures:—

	1919	1909
Number of establishments	1,414	1,020
Proprietors and firm members	1,410	942
Salaried employees	1,120	682
Wage earners (average)	6,382	3,602
Capital	\$30,933,030	\$13,017,932
Salaries	2,079,199	615,621
Wages	7,905,426	2,297,512
Cost of materials	42,985,870	11,476,350
Value of products	62,170,782	17,870,135
Value added by manufacture	19,184,912	6,393,785

The principal industries in 1919 were flour-mill and grist-mill products, bread and other bakery products, printing and publishing, automobile repairing, cars and general shop construction and repairs by steam railway companies, lumber and timber products.

Doane Robinson, secretary of the state History Department, estimates the value of the total production of all commodities as \$581,119,000 in 1918; \$481,624,000 in 1919; and \$316,305,000 in 1920. He gives the produce sold outside of the state as \$270,536,000 in 1918; \$376,720,000 in 1919; and \$324,667,000 in 1920.

**Finances.**—The bank deposits were \$206,496,073 in 1918; \$235,617,276 in 1919; and \$251,804,649 in 1920. They were protected by a depositors' guarantee fund amounting to \$1,247,397 in 1920. The total assessed valuation of all taxable property was \$1,598,544,562 in 1918, \$2,095,154,178 in 1919, and \$2,257,853,656 in 1920. The

assessed valuation was usually not above half the real value, but even so amounted to \$3,547 per capita in 1920. The tax levied was \$17,781,439 in 1918, \$21,470,598 in 1919, and \$27,550,312 in 1920. The expenditure for the state Government, education, charitable and penal institutions was \$1,255,593 in 1910, \$9,711,964 in 1920. The state's debt in 1910 was \$1,073,575 which was reduced until in 1919 the funds in excess of the debt amounted to \$35,785. In addition there were in 1920 outstanding bonds, covering rural credit, highway and land settlements, amounting to \$33,800,000.

Since 1917 South Dakota has had a noteworthy state rural credit system. Up to 1921, 13,575 applications had been made for loans amounting to \$61,243,000. The rural credit board conservatively allowed only 7,915 loans, amounting to \$31,083,450. This is more than four times the business done in the state by the Federal Farm Loan Board. The state can borrow money several per cent below the rate paid by individuals, and gives the farmers this advantage. The rural credit system having proved a success, the voters at the election of 1920 empowered the Government to make similar provisions for people in the towns. A law was consequently passed by the Legislature to create a municipal credit board and to make state loans to individuals for the purchase of homes. The state insures crops against hail at a low rate per acre. The Government administrative departments have been enlarged and a number of new commissions or departments have been created, including the following: insurance, railways, free circulating library, marketing, highway, rural credit, industrial, immigration, pure food and drug, state engineer, budget, tax, agriculture, charities and corrections, bank, depositors' guarantee fund, securities, health, pharmacy, live stock (sanitary), game and fish, coal mines, land settlement.

**History.**—South Dakota remained strongly Republican throughout the decade 1910-20. Of the political questions before the people the primary election law received the greatest attention. Successive Legislatures failing to deal with the matter by statute, an appeal to the initiative was successfully made at the election of Nov. 1912. Several months later, the Legislature of 1913 passed an Act of its own, and submitted it to the people at the 1914 election. It failed and the 1912 law remained in force. Thereupon the 1915 Legislature repealed the 1912 law and enacted one of its own, only to have the 1912 law in a somewhat revised form carried in the 1918 election. There has been much progressive legislation. The Non-Partisan League is a strong and active organization, but since a number of its policies have been adopted and carried out in legislation by the older parties it has not gained control of the Government. The code was revised and published in 1919. The number of men supplied by the state in the World War was 35,000, 10,000 being volunteers. There was purchased, in the state, of the Liberty and Victory bond issues \$109,627,200. A bonus was voted for those who served in the World War and the sum of \$6,000,000 appropriated for this purpose. Ex-service men engaged in farming are also given a state loan for "purchase of land, improvements and live stock to be placed on the land." The loan may be as high as 70 and even 90% of the value, and is payable on the instalment plan over a period of 30 years.

The governors since 1910, all Republicans, were Robert S. Vessey, 1909-13; Frank M. Byrne, 1913-7; Peter Norbeck, 1917-21; William M. McMaster, 1921- . (C. C. \*)

**SPA** (see 25-525).—Pop. (1909), 8,293. The Germans occupied the town, which was undefended, on Aug. 4 1914, and it became first a hospital base and, later, a place of convalescence for their sick and wounded. The German Great G.H.Q. was transferred here from Kreuznach in March 1918 and the Kaiser fled from the Château du Neubois, 2½ m. E. of the town, into Holland on Nov. 8 1918. His concrete dugout at the château is preserved intact and shown to visitors. A conference of the Supreme Council of the Allies was held at Spa in July 1920.

**SPAIN** (see 25-527).—At the census of 1910, the total pop. (including the Balearic and Canary Is., as well as the territories of Northern Africa, but not those of the Guinea Colony) was 20,364,392, giving a density of 34.40 per sq. kilometre. The maximum density corresponds to the province of Biscay (161.59 per sq. km.) the minimum to that of Lerida (23.45). Figures above 100 per sq. km. are given by the province of Barcelona (148.46); Guipuzcoa (120.28); Pontevedra (112.80), and Madrid (109.80). There are only eight towns of more than 100,000 inhabitants, namely, Madrid (599,807), Barcelona (587,411), Valencia (233,384), Seville (158,287), Malaga (136,365), Murcia (125,057),

Saragossa (111,704), Cartagena (102,542). The birth-rate varied between 2.83 and 3.08 per 100 inhabitants for the period 1914-9, 0.16 per 100 inhabitants being illegitimate. The marriage-rate fluctuated between 0.65 and 0.67 per 100 inhabitants during the war years, and made a sharp rise to 0.81 in 1919. In the same period the death-rate varied between 2.13 and 2.31 per 100 inhabitants, with an exceptional rise to 3.31 in 1918. Infant mortality is very high, being 20-20% of the total of deaths for infants of less than one year, and 16.73 between one and four.

**Education.**—There were in 1910 59.35% people who could not read (figure including and referring to all ages). In 1919, 51,815 youths (of which 3,730 were females) were studying in secondary schools. In the same year 23,660 students were inscribed in the 11 universities of the country. This figure does not include numerous special and technical colleges, catering for certain professions such as architecture, engineering, veterinary science, etc., or the numerous agricultural, and arts and crafts, schools financed by the Government, municipalities and provincial councils.

**Agriculture.**—Some progress is shown in area and production. Wheat crops oscillate near an average of 3,265,000 tons and reached their maximum at 4,145,751 in 1916. The wheat area averages 3,809,464 hectares. Barley shows greater fluctuations with an average of 1.5 million tons. Maize keeps close to its average of 0.6 million tons, while oats remain at 0.4 million tons. Vineyards suffer from parasitic trouble, and the area planted diminished gradually from 1905 (1.4 million hectares) to 1914 (1.2) then began to grow again, but without reaching its previous value. Yet the maximum crop corresponds to 1917 with over 4 million tons, of which 3.8 million were transformed into wine and produced 23.7 million hectolitres. The olive area grows steadily, and reached 1.6 million hectares in 1918. The maximum crop corresponds to 1911 with 2.2 million tons of olives, of which 2.1 were transformed into oil (0.4 million tons). The average figures are about half. Sugar, both cane and beetroot, is cultivated, but while cane decreases, beetroot shows an irregular increase in area (36,741 hect. in 1911, 66,000 in 1918). This increase does not, however, correspond to a similar increase in production. The best year was 1913, with 1.3 million tons, and the worst 1918, with 0.672 million tons. While the average value of the annual agricultural production of the country in 1903-7 was estimated at 3,824,394,425 pesetas (£152,975,777), it was valued at 7,975,623,025 pesetas (£319,024,921) in 1916. A growing tendency is manifest towards the use of mechanical implements, of which there are several manufacturers in the country. More important machinery is imported, mostly from America.

**Mining.**—Mining was much stimulated by the war, the high price of coal having allowed the working of deposits which would not have been economically workable in normal conditions. Some Spanish products played an important role in the war; thus, pyrites were in high demand. The total value of the production of Spanish mines passed from 453 million pesetas in 1910 to 1,323 millions in 1917.

**Railways.**—There are 14,902 km. of railway lines, of which 11,378 are normal and 3,524 narrow gauge. In 1918, the number of persons conveyed rose to 75,480,648, or an average of 206,796 daily. In the same period the transport of goods rose to 35,244,659 tons. Gross receipts amounted to 557,931,445 pesetas, or 37,060 per kilometre.

Pre-war and after-war traffic figures are as follows:—

	Persons	Goods (tons)
Pre-war average . . . . .	50,350,000	29,090,223
1920 . . . . .	84,300,000	35,351,920
Increase . . . . .	33,950,000	6,261,697

When war broke out, the Spanish railways were going through a crisis of growth, the traffic of the country having developed in excess of the railway plant, while the companies found themselves too near the date when they had by statute to revert their lines to the State, to be able to borrow money on good terms. The war aggravated this situation by all but stopping coast-shipping. Since then, a great increase in salaries and wages, as well as the rise in the price of coal and materials, has completely upset railway finance. An increase of 15% in rates was allowed after much opposition, and another is proposed which public opinion refuses to countenance. Several schemes are afoot to cope with the difficulty, all of them including a greater or lesser measure of State interference.

An electric railway line is proposed to link Dax with Madrid and Algeciras, by means of a French-gauge line, to be linked up in the future with Moroccan lines. This scheme is subordinate to a general scheme for the harnessing of water-power in the whole peninsula, through the construction of hydro-electric stations and a polygonal distribution line. A further advantage of the scheme would be that the numerous deposits of second-rate fuel existing in the peninsula would then be economically exploited in the production of electricity.

**Merchant Marine.**—Despite heavy war losses, the merchant fleet was in 1920 slightly larger than in 1914. The figures for 1920 were:—

		Ships	Tons
Sail . . . . .	more than 500 tons	38	53,906
	less than 500 tons	516	60,639
Steam . . . . .	more than 500 tons	379	840,007
	less than 500 tons	259	52,640
Total		1192	1,007,192

This represents an excess of 318 sailing vessels with 81,575 tons and 10 steam vessels with 48,325 tons over 1914.

**Industry and Commerce.**—The war gave great stimulus to Spanish industries. Though many enterprises born out of the artificial conditions created by an exceptional Allied demand died out with the peace, progress is to be observed, particularly in Catalonia, Biscay and Asturias. Thus, while in 1905 there were in Spain 775 business corporations with an aggregate capital of 5,633 million pesetas, there were in 1916 no less than 2,435 of such corporations with a capital of 9,456 million pesetas. The average value of foreign trade for the pre-war period was about 2,250 million pesetas, or 112.90 pesetas per head. The war radically altered the régime. The commercial balance was against Spain in 1911. An excess of imports over exports, which had reached 150.5 million pesetas in 1900, fell to 3.6 in 1904, exceeded 100 millions in 1905 and 1906, fell to 2 millions in 1907, and varied between 16 and 75 millions in the following years, while in 1912 there was a 10.6 million excess of exports. 1913 and 1914 saw high excess of imports again (229 and 170 millions), but after the war régime began in 1915 Spain registered in 1918 her maximum favourable balance, amounting to 338 million pesetas. Considerable imports of gold and silver tended to neutralize this figure in the total commercial statistics. The value of the peseta rose accordingly (see EXCHANGE, FOREIGN).

**Banking.**—The Bank of Spain increased its gold reserves considerably. From 576 million pesetas in 1914, they grew to 2,415 million pesetas in 1919. Banks developed in all parts of the country, and, with the end of the war, a general invasion of foreign banks was also to be observed. English banking, which till then had not seemed to be interested in the peninsula, appeared in Spain, and now forms an important feature in Spanish business, not only in Madrid, but in Barcelona, Valencia, Seville, etc.

**Finance.**—The Budget shows an increasing deficit due mostly to two causes: on the expense side, an increase in numbers and salaries of the bureaucracy; on the receipt side, a failure to reorganize taxation on a sound basis of direct taxes. If 1909 be taken as a unit (100), expenditure grew steadily up to 168 in 1918, while receipts grew to 134, including Treasury bills. The actual figures in pesetas for 1920-21 were:—Expenditure, 2,403,730,313.69; receipts, 1,842,720,570.32; the deficit being 561,009,743.37. The Public Debt, which had diminished by 2,000 million pesetas in 1910, had reached its previous amount again in 1918, and in 1920 was 11,926,295,232 pesetas.

**HISTORY.**—The closing months of 1910 were occupied by important legislation carried on by the Canalejas Government. The "padlock" bill, forbidding the settlement of further religious communities in Spain until the negotiations with the Vatican were completed was carried in the Senate (Nov. 4) and a compulsory service bill introduced while the Chamber discussed a Municipal Taxation Reform Bill with a view to the suppression of the unpopular *octroi*. Meanwhile, Señor García Prieto, after laborious negotiations, brought to a head the Spanish-Moroccan Agreement, which was signed in Nov. (see MOROCCO). The Agreement was well received by all political parties except the extreme Left. A bill was introduced and passed, regulating work in the mines; a moderate measure but a step in the right direction. An important political event, the breaking up of the Republican-Socialist block which had been created under the Maura-Cierva reactionary administration, was brought about unexpectedly by a debate on the Barcelona water supply. Señores Azcárate, for the Republicans, and Iglesias, for the Socialists, having expressed their disapproval of the action taken in the matter by Señor Lerroux and his radical followers, who controlled the municipality of Barcelona, a rupture ensued. Thus began the gradual weakening of the anti-dynastic Left, which continued in later years. The "padlock" bill was passed by the Chamber of Deputies on Dec. 22.

Señor Canalejas' Cabinet ended the year greatly strengthened by its vigorous legislative policy. Yet, on the last day of the year, the prime minister being desirous of reconstituting his ministry handed in his resignation, and the King having renewed

Canalejas  
Ministry.

him his confidence, the new Cabinet was sworn in slightly reconstituted. The crisis thus settled, the King visited Melilla (Jan. 7-13) amidst scenes of great enthusiasm, France being represented by Gen. Toutée and by the warship "Du Chayla." Rumours of a Spanish intervention in Portugal began to circulate then but were promptly met by a strong denial from Señor Canalejas himself. This second Ministry lasted till April 3. Its main efforts were spent in securing unanimity for the negotiations with the Vatican, the most important point of which was the drafting of a new Associations Bill to apply to religious as well as to ordinary communities or societies, the Vatican refusing to renew negotiations unless the Spanish Government agreed to submit its bill to the approval of the Holy See. Señor Canalejas naturally resisted such a condition.

**Associa-  
tions Bill.**

The Government was somewhat weakened by the attacks of Señor Urzáiz and Señor Azcárate on its financial policy particularly on their bills for the reform of the Public Debt and for certain alterations in the working of the Bank of Spain. But the end came from another quarter. A debate on the Ferrer case (see 25,568) gave rise to an extremely grave crisis. An outspoken speech by Don Melquíades Álvarez was answered by Señor Canalejas in a half-hearted way, which did not sufficiently conceal the fact that the prime minister was not far from agreeing with the opponents of the military court which had sentenced Ferrer. A deep discontent was soon manifest in the ranks of the officers of Madrid, and the War Secretary, Gen. Aznar, intimated that in his opinion the debate should be closed at once. Señor Canalejas submitted the resignation of the Cabinet to the King, who renewed his confidence to his prime minister. The new Cabinet appeared before the Cortes, and the debate on Ferrer's case was proceeded with in a somewhat cooler atmosphere. The incident was, however, typical as a forerunner of much that was to come in future years.

**The Ferrer  
Case.**

The attention of Parliament was soon diverted towards Moroccan affairs. The French were preparing their advance on Fez, a fact which forced Spain to an active policy in order to maintain her much diminished rights in Morocco. The first signs of this policy were received with ill humour by the French press, and a press duel began then between the two nations which was to last to the very eve of the World War. Meanwhile the Government had introduced its long expected Associations Bill (May 8), which provoked a protest from all the archbishops and bishops headed by the primate. The Government were successful in passing the bill for the suppression of the *alcotri* (May 22). This success initiated a campaign of active opposition from the Conservatives, the aim of which was to defeat the bill in the Senate, but the plan failed, for the bill was passed by the Senate by 178 to 63 (June 3). The fact was significant of the amount of determination exercised by the Crown, for if it had not used its influence over the non-elective part of the Senate the Government would have been defeated by the Conservative vote.

The Government, meanwhile, in the teeth of popular opposition, rendered more dangerous by several strikes, was sending troops to Morocco and preparing for events. On June 9, Spanish troops landed at Larash, thus putting France before a *fait accompli* which was not much to the taste of the Quai d'Orsay. France, however, was prevented from taking any strong action by the sudden arrival of the "Panther" at Agadir, but a certain tension prevailed between France and Spain all through the summer. At the same time, popular opposition to the war, not only to that which was going on in Morocco but to that which it was feared was going to break out in Europe as well, was spreading, and tended to encourage the extreme parties. Meetings took place in Barcelona and Madrid, this last one being stimulated by the presence of two French "comrades"; and a Republican rising plotted by the lower deck of the cruiser "Numancia," though unsuccessful, startled public opinion. The movement seems to have been connected with political efforts to overturn the monarchy, which were being prepared on land.

The greatest danger, however, was to come from a campaign of strikes which began early in the year. In Sept., nearly all these strikes still dragged on, and their effect was further aggravated by the feeling that the Government was attempting a big operation in Morocco, behind the backs of the people. Grave disorders occurred in the Bilbao district, where 20,000 steel smelters went on strike, and the situation developed soon into a general strike, which spread to the coalfields of Asturias. The Government, which at first seemed inclined to favour the workers for the sake of national conciliation in view of the international situation, gradually veered round. They began by suspending the constitutional guarantees in Biscay (Sept. 12); then, on receipt of grave news from Asturias, in the whole of Spain (Sept. 19). By this time, the movement had spread to nearly the whole peninsula, and grave disorders had occurred in Catalonia and Valencia, notably in Cullera, where a magistrate was mobbed to death. The Government met the situation with coolness and resolution, and by Sept. 22 the strike fever had abated upon the settlement of the Bilbao strike.

**Labour  
Troubles.**

General Luque himself, though then a War Secretary, was sent to Morocco to preside over the operation, which began successfully on Dec. 6, but collapsed a few days later after a gallant attempt to force the passage of the River Kert. The Spanish press voiced a belief, then current in the Spanish army, that the Moorish tribes were provided with French arms and ammunition, and the imprisonment by the French Gen. Toutée of several French officials in Ujda gave some colour to this view, much resented though it was by the French press. General Luque, though in a veiled manner, suggested in an interview to the press that his failure had been due to lack of French coöperation. Under such unfavourable conditions began the negotiations for a Franco-Spanish agreement following upon the Franco-German Treaty on Morocco. The Spanish troops were soon attacked on the River Kert, and rumour attributed the move to French initiative. The matter had to be smoothed over by the Foreign Secretary, Señor García Prieto (Dec. 28).

**Morocco:  
Tension  
with  
France.**

During the first days of the new year the case of the Cullera riots came before the military supreme court. The court pronounced seven death sentences; and a press campaign started at once for the reprieve of the seven condemned men. Señor Canalejas seized the opportunity to make the King benefit by the popularity which always follows acts of clemency. He brought his Cabinet unanimously to agree that six out of the seven men should be reprieved, but that the seventh, the head of the riot, known as *El Chato de Cuqueta*, could on no account be recommended for mercy. He then allowed King Alphonso to be besieged by petitioners, including the old mother of the doomed man, who was granted a special audience, so that the King might be provided with an excuse for reopening the affair. Thereupon, Señor Canalejas agreed to reprieve *El Chato*, but resigned. Though the resignation was purely formal, the King took for himself all the merit of the act of clemency, and a wave of popular gratitude was his reward. Thus by a mixture of mercy and ability, Señor Canalejas reversed in 1912 the position which Señor Maura had created by his uncompromising policy of 1909, and this incident did much to harden Señor Maura in his attitude of "implacable hostilidad" to the Liberal party.

**Cullera  
Rioters  
Reprieved.**

Much of the parliamentary session was spent in the usual recriminations wherewith the Conservative party endeavoured to weaken Señor Canalejas' position, and on March 11 Señor Canalejas had to sacrifice several of his colleagues, notably his Minister of Public Works, Señor Gasset. The King renewed his confidence to Señor Canalejas, and the new Cabinet was reshuffled. The inclusion (as Minister of Education) of Señor Alba, known to be a personal follower of Señor Moret, was considered as a token of reconciliation between Señor Canalejas and his former chief. Señor Canalejas seized the opportunity afforded him by this crisis to adjourn Parliament until May 1.

**Canalejas  
Cabinet  
Recon-  
structed.**

The salient feature of this interval was the launching of the Reformist party by Don Melquiades Alvarez, a moderate Republican working in close touch with Señor Azcárate and Señor Perez Galdós. In a first speech delivered on April 7, Señor Alvarez announced the formation of a Reformist party which would reconcile the moderate elements of the middle classes with Republican ideas. This was but the beginning of an evolution which was destined to bring a certain important portion of Republican opinion into the fold of the monarchy. On May 1 the Cortes was reopened and an agitated parliamentary session began, in which the main question in debate was the bill called "De Mancomunidades." This bill was a *sop* given by Señor Canalejas to Catalan opinion, for it allowed *Dipulaciones* (elected provincial councils) to unite

#### Local Government Bill.

into groups for purposes of common administration, a measure which, though in appearance of a general character, was meant to enable the four Catalan provincial councils to unite into a kind of local parliament. The bill caused a deep cleavage in the ranks of the Liberal party. General Weyler, Señor Montero Rios (president of the Senate), Señor Moret, and Count Romanones (president of the Chamber) were all emphatically against it. Señor Canalejas' difficulties were increased by the fact that, though the measure formed a part of a more ambitious Local Government Bill devised by Señor Maura during his last term of office, Señor Maura opposed it on the ground of its having been as it were taken from its context. Yet Señor Canalejas piloted his bill successfully through a hostile Chamber, and when, on July 5, he had the Cortes adjourned, the bill had been virtually passed. He, however, avoided a final vote, knowing that, on the bill appearing before the Senate, Señor Montero Rios would resign. His triumph was therefore more apparent than real.

With the summer a period of strikes set in. Saragossa, Málaga and the mining and steel-smelting district of La Felguera (Asturias), became restive with social strife (August). Reus, Madrid and Murcia also suffered from partial strikes. But all these conflicts were soon overshadowed by a grave railway strike which affected nearly the whole country. Señor Canalejas met it by applying Art. 221 of the Recruiting Law, which in cases of danger or abnormal circumstances allows the drafting into military service of all men of military age working in industries of public importance; and this measure, combined with a really conciliatory policy, caused the collapse of the strike on Oct. 5. On Oct. 14 the autumn session of the Cortes began, and three days later the bill "De Mancomunidades" was passed in the Chamber, but the work of the session was suddenly brought to a close by the murder of Señor Canalejas on Nov. 12. The

#### Period of Great Strikes.

#### Murder of Canalejas.

prime minister was shot dead in the Puerta del Sol (Madrid) in broad daylight, while he was inspecting the books at a book-shop window. The emotion aroused by the crime was enormous. The King, with his usual impulsiveness, hurried to the Home Office, where the body had been laid, in the first carriage which he found at his disposal; then, on the day of the funeral, he walked in person at the head of the mourners, through the streets of Madrid. This brought him great popularity. Meanwhile, Count Romanones had replaced Señor Canalejas at the head of the Government, with the definite task of passing the budget and of completing the treaty with France. On Dec. 27 this treaty was signed, after laborious negotiations which had begun on Dec. 6 1911. The discussion of the treaty occupied the remainder of the session, which Count Romanones closed at Christmas.

Having thus fulfilled the programme for which he had been entrusted with the seals of office, Count Romanones gave the King an opportunity to alter his policy by tendering the resignation of the Cabinet. The King, without consulting any of his statesmen, gave Count Romanones a new lease of power. This decision finally settled the question of Señor Canalejas' successorship to the direction of the Liberal party in favour of Count Romanones.

#### Romanones Government.

Yet, his rival, Señor García Prieto, though bowing for the moment to the royal pleasure, signified his intention to stand for the leadership in the future by abstaining from a seat in the Cabinet, though coöperating with Count Romanones from outside. The Liberal solution of the crisis contributed further to increase the popularity of the King. The sensational withdrawal from public life which Señor Maura announced on Jan. 1 1913 worked in the same direction. In a lengthy note addressed to his followers he animadverted on the action of the King in having lent himself to a policy of coöperation between the Liberal opposition and the antidynastic Left. Señor Maura resigned his seat in the Chamber, followed by Señor La Cierva, and as these two names had symbolized reaction to the Spanish people since 1909, their withdrawal, in direct conflict with the King, enhanced the prestige of the Crown. Señor Maura's retirement was of short duration. On the 4th he saw the King; on the 10th he answered a message from his followers by accepting once more the leadership of the party.

Señor Alvarez, who meditated a *rapprochement* with the monarchy, made on this occasion a sensational speech, in which he had the courage to bestow great praise on the King at a public Republican meeting. Encouraged by the success of this first attempt, he spoke in the same strain in Murcia (Jan. 12) and obtained from his Republican audience an enthusiastic ovation for the King's policy. Nor did King Alphonso sleep on his laurels. On Jan. 14 he summoned to the palace for consultation the three most eminent men of Republican Spain, Señor Azcárate, head of the Republican-Socialist Coalition, and a respected specialist in labour questions, Prof. Cossío, a well-known pedagogist and art critic, and Señor Ramón y Cajal, the famous biologist. The significance of these interviews escaped no one, and least of all the Conservative Reactionaries. On Feb. 11, these interviews were the main subject of speeches delivered by Señor Azcárate and Señor Alvarez at a Reformist banquet in Madrid, the net result of which was the public recognition by these gentlemen of the fact that, whatever obstacles there were to the democratization of Spain, they did not come from the Crown. The meeting, a further step towards the monarchy taken by the middle-class and intellectual section of the Republican party, served to outline a scheme of conditions and constitutional guarantees which the Reformist party would require in order to coöperate with the Crown.

Count Romanones took a good share of whatever merit there was in this policy. The death of Señor Moret (Jan. 28) removed his most serious rival in the Liberal party. Count Romanones then endeavoured to persuade Señor Azcárate to accept the presidency of the Chamber, a clever move likely to reflect favourably on the prime minister, while avoiding the elevation of any would-be rival to the post considered in Spanish politics as the stepping stone to the premiership. Señor Azcárate refused, and Señor Villanueva was at last selected. The King's official visit to Paris, on completion of the Franco-Spanish treaty, had proved a success (May 6-9), and Count Romanones, having replaced Señor Villanueva by Señor Gasset as Minister of Public Works, felt strong enough to face the Cortes. But no sooner had he appeared before Parliament (May 26) than a speech by Señor Maura (28th) forced him to hand in his resignation. Señor Maura had merely re-stated his position of "implacable hostilidad" to a policy of coöperation with the parties of the antidynastic Left, and Count Romanones thought that no Liberal party could govern without a properly constituted Opposition, willing to take office on the fall of the Government. The crisis was again solved by the Crown in favour of the Liberal party. The King ratified the policy which Señor Maura had refused to countenance, and Count Romanones came back at the head of the same Government. But the discussion of the bill "De Mancomunidades," which at last had to come before the Senate, produced a still graver crisis, for it precipitated the division of the Liberal party, latent since the death of Canalejas. The group headed by Señor Montero Rios (president of the Senate), and his son-in-law, Señor García Prieto, dissented from that of Count Romanones on the prin-

ciple of this bill, Count Romanones having accepted it as part of Canalejas' political testament. This difference of opinion brought about the resignation of the Cabinet (June 11). Despite insistent efforts from the King, no solution could be found to bridge over the difficulty; and on June 13, Count Romanones having failed to conciliate the non-conformists of his party, formed a Cabinet of personal followers, which aggravated the division. Parliament was indefinitely adjourned. The division in the party materialized in the formation of a Garcia Prieto faction, and it was generally realized that the solution given to the crisis was a mere stop-gap, necessitated by the coming visit of M. Poincaré to Madrid.

The Government weathered several strike difficulties and had to face a troubled period of unrest in Morocco, where Gen. Marina succeeded Gen. Alfau as High Commissioner.

**Francospanish Rapprochement.** A Franco-Spanish *rapprochement* was then initiated, with a visit of Gen. Lytautey to Madrid and of

M. Barthou, the French prime minister, to San Sebastian, where he saw the King. All these movements prepared the ground for the official visit of M. Poincaré, then President of the French Republic, who arrived in Madrid Oct. 7. The President left Spain by way of Cartagena, where he embarked on the battleship "Diderot," Spain being represented by the battleship "España" and England by H.M.S. "Inflexible." Both the King and the President emphasized the fact that it was in Cartagena that six years earlier Spain, France and England had agreed on a common policy in the Mediterranean.

As soon as the summer holidays were over and M. Poincaré had left Spanish soil, the latent crisis which divided the Liberal party broke out again. The prime minister had to provoke it himself in the Senate. He was beaten (Oct. 25) and he resigned. The King then considered that the Liberal policy which he had consistently followed since Señor Maura's fall in 1909 was at an end. But he was not ready to follow Señor Maura in his uncompromising attitude, and he selected Señor Dato as a solution more acceptable to the democratic wing of the country. Señor Dato was unable to consult his chief on the King's offer, for Señor Maura had left Madrid for an unknown destination. He therefore accepted office (Oct. 27), being averse to leaving the Crown without the services of one of the two great historical parties. From this date, the Conservative party began to show open signs of division, and thus the second of the two great rotating parties, which Cánovas and Sagasta had created, began also to disintegrate. The first act of the new Government was to grant a decree giving validity of law to the bill "De Mancomunidades," a move directed to enlisting the sympathies of Conservative opinion of Catalonia. On the last day of the year, Señor Dato obtained from the King a decree dissolving the Cortes.

The first half of 1914 saw the consolidation of the Dato faction of the Conservative party. The general election, which took place in the spring, yielded a sufficient majority, both in the Senate and in the Chamber. Moroccan affairs were the main subject of discussion in Parliament and press, and the King lost a good deal of the popularity which he had won under the Liberals on account of several incidents which, rightly or wrongly, were interpreted as acts of personal power and interference with the discretion of the Government in military matters. This opinion was strengthened by an uncalled-for decree, countersigned by Gen. Echagüe as War Minister, establishing the King's right to correspond directly with his army officers of all ranks. Yet the Reformist movement, which had gathered great momentum at a demonstration on Oct. 23 1913, when Don Melquiades Alvarez had defined its aims and limits, gained ground, ably helped by an intellectual group headed by Prof. Ortega y Gasset.

The international situation of Spain at the outbreak of war was defined by two sets of circumstances: official, and national or popular. The official situation was ruled by the Cartagena Agreement of 1907, confirmed by the conversations held in the same place in 1913 between M. Poincaré and Count Romanones. These agreements and conversations stipulated that "should

new circumstances arise tending to alter the territorial *status quo*" in the Mediterranean or in the European and African coasts of the Atlantic, the three powers concerned (Spain, France and England) would "enter into communication" in order to take any measures that might be necessary. The war was obviously a "circumstance" falling within the limits of the above definition. Yet Spain did not "enter into communication" with France and England. But, contrary to what was generally believed at the time, her abstention was due to the fact that the two powers most interested in the matter, France and England, made no sign to set in motion the Cartagena Agreements. Faced with this situation, Señor Dato promptly declared for an absolute neutrality. This decision was based on a sound reading of the situation from its national and popular point of view. The violation of Belgium had given to the war an almost sacred character which the Allies emphasized to the full. Yet the fact did not escape Spanish public opinion that, though the defence of Belgium and the interest of the Allies were two coincident aims, they were not essentially one and the same "cause." Thus, while the generosity of England in rushing to the rescue of Belgium (and for that matter of France) was not denied, it was also realized that England had a strong national interest at stake which powerfully helped her to make up her mind. Now, such a strong national interest was entirely lacking in the case of Spain. Spain was in fact the only European nation which had no stake in the war. Add to this that the nation was divided as to its feelings. The working classes, the more numerous part of the intellectuals and most of the trading communities, were pro-Ally. The clergy, most of the army and of the bureaucracy and the "idle rich," were pro-German. The Moroccan negotiations had by no means improved the feelings of the Spanish people towards France. For the well-informed politician and publicist, France was the nation which treated with Germany and with England as if Spain did not exist, and turned round afterwards to make Spain pay what she had had to pay in Berlin or in London. For the clergy, France was the atheistic republic, the scarlet woman of the West. For the army, France was the ever-watchful rival in Morocco. For all of them, England was a nation whose dominating principle in foreign affairs was the increase of British power. Thus, the country was split into a reactionary and conservative pro-German wing and a democratic or "advanced" pro-Ally wing, and, as this division was real, and not fictitious as were the party groups, it cut across the parties. So-called Conservatives such as Señor Sánchez de Toca, so-called Liberals such as Count Romanones, sided with Reformists and Republicans on the pro-Ally side, while Liberals such as Señor Villanueva and Conservatives like Señor Besada led the pro-Germans.

On one definite point everybody agreed. Spain was to keep out of the war. There were only two exceptions, more apparent than real. Señor Lerroux, the leader of the Catalan Radicals, advocated participation in the war on the side of the Allies. But he spoke without responsibility, as a man who knows that he can make capital out of an opinion which he is perfectly sure he will never be in a position to carry into practice from office. The other case was more serious. On Aug. 10 *El Diario Universal*, a paper known to reflect the opinions of Count Romanones, published an article under the title of "Deadly Neutralities," which in a veiled manner advocated participation in the war on the side of the Allies. It created a great sensation, for it was attributed to Count Romanones himself, and it is certain that, if not written by him, the article was concocted under his direct inspiration. As events were to show, it was only meant as a *ballon d'essai* and, after a short period of press agitation, was forgotten.

The Government concentrated their activity on the organization of the country for the new situation created by the war. A "Committee of Initiative" was created for the study and coördination of national and private efforts to deal with war problems, and this Committee was put under the chairmanship of Señor La Cierva—a move to attract this important political figure to the Datist side of the

**Opposition to the King's Personal Power.**

**Policy of Neutrality.**

**War Legislation.**

Conservative party. Parliament resumed its sittings on Oct. 30 and unanimously endorsed the foreign policy of the Government. The country was meanwhile recovering from the first shock of the war, getting used to abnormal conditions, and even beginning to realize that there might be some material profit to be made out of it. The pro-German press raised frequent protests against the enormous increase in exports to France which the Customs reported. Metals, raw and manufactured, clothes and boots, all kinds of foodstuffs, horses and mules, poured into France, under the "neutral" eye of the Government. Before adjourning the Cortes, however, the Government introduced and passed a bill which gave them special powers to deal with such matters as customs tariffs, railway rates, State purchases of food, shipping and expropriation of foodstuffs. A navy bill was also passed, authorizing the building or purchase of 4 fast cruisers, 6 destroyers, 28 submarines, 3 gun-boats, 18 mine-laying and auxiliary ships, mines and submarine defences, aircraft, and several important naval land works in Ferrol, Cadiz and Cartagena. The Foodstuffs Act did not prevent a period of serious unrest in the spring, due to the scarcity artificially created, partly by excessive exports, partly by speculative holding up of stocks. Special Juntas, composed of the civil governor, the financial delegate and the mayor of the provincial capital, were set up in each province to administer all available stocks of food, and a policy of prohibition of exports was even initiated in March (1915). Yet the great increase in exports had contributed perhaps more than any other cause to the rise in the value of the peseta, a rise which gave the Government an opportunity to repatriate the Public Debt, *i.e.* enacting that all Spanish Government stock held by foreigners which was payable in francs or sterling should become payable in pesetas in the Spanish market.

Though the Cortes was closed, great political activity was displayed, by all parties, with a view to a consolidation of the loose political forces of the day into that symmetric form of two rotating parties the need of which seemed to be felt as a habit by all concerned. This activity, which the Government had driven towards the press and public meetings by closing Parliament, was stimulated by an active German propaganda, soon to be imitated by similar endeavours on the part of the Allies. The mouthpiece of extreme pro-German views was Señor Vazquez de Mella, an eloquent and versatile Carlist professor and M.P., who on May 31 pronounced a strong pro-German speech in the Zarzuela theatre (Madrid), before a house full of Germans, Carlists and Maurists, and adorned by the presence of a cluster of aristocratic ladies, many of whom belonged to the Queen's household. But though the excitement produced by this and similar outbursts of partisan feeling did not go very deep, and though the mass of the people were not swayed out of the attitude which they had spontaneously assumed, the Government thought there might be some danger in liberty, and they decided to deny all permits for meetings on neutrality and the war. Despite many complaints, for the measure was obviously illegal, the Government held fast to their decision.

It is worth noting that while this protest from all political groups, including the two sections of the Liberal party headed by Count Romanones and Señor García Prieto, failed to shake the power of the Government, a crisis was precipitated on the refusal of the business community to coöperate with the Government in the launching of a loan. The Finance Minister, Señor Bugallal, prepared an issue which was expected to yield 750 million pesetas (£30,000,000), 283 of which were already covered by exchange for an equivalent sum in short-term bonds. The new money to be found did not therefore exceed 467 million pesetas, or a little over 19 millions sterling. Now, of this sum, no more than 52 million pesetas (just above 2 millions sterling) was subscribed, and it was noticed that small subscriptions far exceeded the sums subscribed by big owners of capital. Several explanations were put forward, but the main cause of the failure seems to have been a reluctance of business circles to subscribe under conditions

which were not considered generous enough for the subscriber. The resignation of the Government (June 22) as a result of this failure was quickly followed by a reinstatement of the same Cabinet, despite the insistent desire for retirement manifested by the Minister responsible, Count Bugallal. The situation of the Treasury was by no means flourishing. The estimates for 1915 had been set at 1,465 million pesetas against 1,281 million pesetas revenue. But as months went by, both sides of the account showed signs of moving in the wrong sense. The liquidation at the end of the year was to show that revenue would remain at 1,202 million while expenses, not including Government purchases of foodstuffs, were to rise up to 1,556 million. The Government had to fall back on Treasury Bonds negotiated through the Bank of Spain.

The difficulties were of course of a purely administrative order, for the work of the country was in full swing under the stimulus of war orders. As one sign of this growing industrial coöperation between Spain and the Allies, the shipowners announced to the Government (Aug. 1915) that the premiums granted them by the Shipping Acts as a measure of protection were no longer necessary and would not be cashed. This was, of course, but a euphemistic way of hinting that such premiums were no longer worth the sacrifice which they entailed of the shipowner's liberty to trade as he pleased between foreign ports. Great shipping profits ensued, and torpedoings followed. On Aug. 17 the s.s. "Isidoro" of Bilbao was sunk by a German submarine. On Aug. 20 the s.s. "Peña Castillo" of Santander sank in obscure circumstances. Public opinion was divided as to the right attitude to take in these circumstances, and while it was generally recognized that some sort of protest should be made, the free hand claimed and obtained by shipowners for the carrying on of their highly profitable industry was a serious handicap to their case.

Though the war absorbed most of the political interest of the day, several efforts were made to reunite the Liberal groups into one party again, and these efforts having failed, owing mainly to the unwillingness of either leader to surrender his claims to the leadership of the whole, Count Romanones, the more active of the two, prepared a plan of campaign against Señor Dato's Government on the Military Reform Bills then being prepared by the War Secretary, Gen. Echagüe. General Echagüe introduced his bills, and Señor Dato declared that the Chamber would have to pass them before discussing the budget. Count Romanones was adamant against this condition imposed by a Government which had kept Parliament closed for the best part of the year, and the Government fell on Dec. 6.

This crisis is worth recalling for it marked a further step in the approximation of Don Melquiades Alvarez to the monarchy. King Alfonso having expressed a wish to hear Señor Alvarez' opinion along with that of the leaders, the chief of the Reformist party called at the royal palace for the first time. The crisis ended in the formation of a united Liberal ministry (the two groups having melted into one as they came nearer the warmth of office). Count Romanones took the premiership, and in order to counterbalance the effect of his well-known pro-Ally views, assigned the Foreign Office to Señor Villanueva, a notorious pro-German. Señor Barroso (Justice) and Señor Burell (Education) represented the García Prieto faction. Señor Urzáiz, an independent and outspoken Liberal, went to the Exchequer, probably at the suggestion of the King, who also caused Admiral Miranda, though a Conservative, to remain at the Navy Office. General Luque came back to the War Office, and Senator Salvador was appointed Minister of Public Works.

The programme of the Government was very much the same as that of its predecessor: neutrality, military bills, financial and economic reforms, and the budget. In a sense, the inclusion of Señor Urzáiz, who, though a Liberal, was a party unto himself, and of Adm. Miranda, a Conservative, initiated the period of mixed ministries, which was about to open as a logical consequence of the gradual weakening of the old parties, and in its

*German Propaganda.*

*Industrial Prosperity.*

*Fall of the Dato Government.*

*Financial Crisis.*

*Romanones Cabinet of Reunited Liberals.*

turn would accelerate the process of their disintegration. The experiment, so far as Señor Urzáiz was concerned, proved a failure. A man with a strong will and little adaptability, he came into conflict with his chief and was dismissed before he had time to resign (Feb. 25). The union of the two branches of the party which this Cabinet consecrated was apparent. Apart from the underlying cleavage between the García Prieto and the Romanones groups, the party showed further signs of division owing to the rising ambitions of Señor Alba, who by a clever use of the opportunities of his new office, made for himself an enviable reputation of a bold democratic tax-legislator. His bill on war profits aroused the opposition of all the minorities except the socialist. Yet Count Romanones, with a fine political flair, backed his Finance Minister. The matter, however, was purely political, for the bill had not been passed when the Cortes was closed, a general railway strike having suddenly upset all Government plans on July 13. Count Romanones faced the conflict with an unusual luxury of precautions, constitutional guarantees were suspended in the whole peninsula, and martial law declared in Madrid. But the strike was over one week later, and the autumn session was too deeply occupied in the discussion of Señor Alba's ambitious budget schemes to think of the War Profits Bill. The discussion of these schemes dragged on till Dec. 19, when it was resolved to validate the old budget for the coming year, while the new one was further discussed. The Government reappeared before the House on Jan. 19, but in the meantime Count Romanones had resigned and accepted office again with the same ministry. This curious crisis (Jan. 9) was probably devised by the prime minister as a means to recover from the King the moral authority which some thought he had lost at the hands of the pro-German press, which accused him of drawing great profits as a business man from his foreign policy as a prime minister.

Count Romanones wore his neutrality with a difference, and, though the inheritor of Señor Dato's policy, he did little to conceal his pro-Ally views. The natural development of the war made every day more urgent the need of defining a policy which would be something more than a mere passive attitude. By Sept. 1916, Spain had lost more than 30,000 tons of shipping by torpedoing, and more than 50,000 in circumstances which were, to say the least, obscure. The shipping interests asked for Government help. A period of Government activity set in, during which Count Romanones was loyally seconded by Señor Gimeno, a pro-Ally Foreign Secretary, but the pro-German press countered by a fierce personal campaign against the weakest flank of the Government, the prime minister's industrial interests. On Jan. 31 Germany sent in a note establishing an "absolute blockade" of the Allied coasts. Count Romanones was committed to a policy which implied a firm answer to such a note. He gave it, for, though somewhat watered down by his pro-German colleagues, the Spanish note of Feb. 6 signed by Señor Gimeno was a well-worded protest against German methods with neutral rights. But the prime minister was too shrewd a politician not to realize that this firmness meant nothing unless backed with the will to fight if necessary, and that public opinion would not follow him so far. He therefore resolved to leave the Government there and then, at the top of the wave of his own policy.

Other considerations of home policy were perhaps not altogether without effect on his decision. A dangerous social-political upheaval was taking place under his eyes. In March and April, a serious strike situation developed in Madrid and Valladolid, which necessitated this second town being declared in a state of siege. In

Barcelona, a military conflict, which was fundamentally to alter Spanish politics for years to come, was beginning to make itself felt. When on April 20 Count Romanones resigned, he took the easiest path. His fall, however, cost him the leadership of his party, the majority of which, somewhat frightened at his bold foreign policy, turned towards Señor García Prieto, while Señor Alba consolidated a separate group. The new Ministry, under the premiership of Señor García Prieto, was

frankly neutralist, and Germany rightly interpreting the position felt freer to intensify its submarine campaign. But the Government had to concentrate on a far graver problem, the situation created by the so-called Committees of Defence. The artillery and engineer officers had been organized for years past into a Committee of Defence, the main object of which had been the maintenance of certain standards of professional honour and of certain rules of comradeship as to promotions, etc. The infantry officers had no such organization, their *esprit de corps* being less developed. But towards the middle of 1916, a system of infantry Committees of Defence had appeared, which soon evinced a tendency to claim authority over the army, and to interfere with the Government in such a manner that towards the end of the year, Count Romanones, then in office, insisted on their dissolution. Despite the reassuring reports of Gen. Alfau, Capt.-General of Barcelona, the headquarters of the organization, the system continued, a situation which was not altogether unconnected with Count Romanones' eagerness to resign in April 1917. General Aguilera, the War Secretary in Señor García Prieto's administration which then took office, was frankly averse to the Committees, and ordered the leaders to be arrested. A reserve Junta had been prepared, which stepped into the shoes of the arrested officers, and the conflict was only aggravated. General Alfau was dismissed and General Marina sent in his stead. But meanwhile, probably owing to royal hints, a less disciplinarian line of action was taken, and the arrested men were released. It was known later that an ultimatum had been placed in the hands of Gen. Marina, with a time-limit of 12 hours (June 1). Not unnaturally, the Government resigned. Count Romanones having refused to support any Liberal situation which would recognize the Committees, Señor Dato was called to office, and on June 9 the Liberal party ended a short spell of office during which its disintegration had rapidly advanced. Señor Dato's Government capitulated before the Juntas and accepted their regulations in full.

**Dato Agala**  
**Prime**  
**Minister.**

This victory of a movement which, in its essence, was revolutionary, had an immense effect on immediate events as well as on the political evolution of the country. The revolutionary ferment was stimulated. A state of excitement and hope—due to the plausible, high-spirited language of the Juntas—spread over the revolutionary Left. The more responsible elements of advanced politics thought it necessary to give a lead to this popular spirit. Political manifestos asking for a renovation in Government and Constitution followed each other (Socialists June 12, Catalanists June 16, Left-Coalition June 16). All but three of the deputies and senators for Catalonia met on July 5 at Barcelona, and passed a resolution asking for an immediate meeting of the Cortes, and declaring that, should the Government refuse to comply with this request, a meeting of all the deputies and senators composing the Cortes would be called at Barcelona on July 19. The Government refused to recognize the right of the Catalan representatives to dictate its policy, and made it known that should the Assembly meet on the 19th it would be considered as rebellious and treated as such. The Assembly met, 13 senators and 55 deputies attending, including all the Socialist Republican and Reformist members of the Cortes, and, before the Civil Governor dissolved it by (formally) arresting one by one all its members, it voted conclusions asking for a reform of the Constitution, and set up three commissions to prepare reports on reforms to be submitted to a second meeting to take place later. At one moment, it looked as if these 68 men would take the lead of the revolutionary spirit which the bold action of the army officers had stirred in the country. But the mass of the Assembly was too dull, and no real leader manifested himself in it. Thus two attempts, one military, one middle-class, both directed against the evils of the old régime, failed through lack of coordination and mutual understanding. A third attempt, and a third failure, was still to come. On Aug. 2 the railwaymen of the Northern railway announced a strike. Though at first the men appeared desirous of a settlement, neither the Government nor the company succeeded in

avoiding the strike, which began on the 10th. On the 12th, a general strike was suddenly launched in the whole country. It was clearly revolutionary, and aimed at the overthrow of the monarchical system and its replacement by a more or less socialistic republic. The country was declared in a state of war. Riots of a grave character took place in nearly every important town and industrial district of the country, and the military, which had been entrusted with the situation, crushed the rebellion with a ruthless hand. This revolutionary onslaught was somewhat aimless and impulsive, yet the period of street fighting lasted a whole week. By Aug. 9 the situation was well in hand. The net result was to prove that the only real force in the country was the Army Committee system.

On Aug. 10, the Council of Ministers passed a special credit for military expenses, implying an extension and renovation of several important services. The Juntas, conscious of their strength, encroached further and further upon the administration of the War Office, and even asserted themselves in the field of civil politics.

Their first victim was Marshal Primo de Rivera, whom they practically forced to leave the War Office. Then the scandal became public, on the Government having lifted the censorship. The Committees attempted to deliver a message into the hands of the King, and a period of intense political excitement ended in the fall of Señor Dato, who had to resign on a "perfectly constitutional" hint by the King. In point of fact Señor Dato was expelled by the Army Committees. The crisis was long and laborious, and in the midst of it, the Parliamentary Assembly met in Madrid (Oct. 30) in order to hear the reports prepared by the three commissions appointed in its first sitting. Speeches were pronounced by Señor Cambó and Señor Alvarez, which were addressed rather to the King, then in consultation with political leaders, than to the Assembly. Both leaders declared that they would not accept office in a Government which would not be ready to adopt the conclusions of the Assembly, involving some democratic changes in the Constitution. But while Señor Alvarez held fast by this declaration, Señor Cambó allowed two of his followers to enter the Cabinet which was at last formed by Señor García Prieto.

This Cabinet was a Coalition ministry in which, in order to give satisfaction to the new demand for an impartial general election, a non-political judge was given the post of Home Secretary. It was composed of Maurists, Liberals and Catalanists. Señor La Cierva, who took the War Office, was the real head of the Cabinet. His policy consisted in ingratiating himself with the Committees of Defence, so as to become their leader and representative.

An incident which occurred early in the year (Jan. 3) showed the extent to which the revolutionary action of the Juntas had affected the army. The N.C.O.'s, it was suddenly found out, had formed a Committee of Defence and were threatening to take action unless their claims were satisfied. Señor La Cierva had no difficulty in applying to them, with the blessing of the Officers' Committees, those drastic measures which the Officers' Committees had themselves deserved. Nor was the system of Committees of Defence limited to the army. Juntas were soon formed by the civil servants of nearly all Government departments, and on Jan. 12 1918, on the occasion of a difference between the Postmaster-General and his subordinates, an agitation began which was ultimately to cause the downfall of the Government. On Feb. 21 the telegraph officers went on strike — by meticulously carrying out official regulations.

On Feb. 24 the general election took place in these abnormal conditions. For the first time a Coalition Government presided over an election, and great hopes were entertained as to the result. The new Chamber, however, was but an average of the preceding ones, different only in that no party in it had a clear majority. Señor La Cierva began then to act as the self-appointed leader of the Committees. He first provoked a crisis (Feb. 27) so as to get rid of his Catalanist colleagues, Señores Ventosa and

Rodés, who would have been obstacles to his plans, and having accepted their replacement by two second-rank men he faced the Government with a demand that a programme of extensive military reform be enacted by Royal Decree, without submitting it to Parliament. This provoked a second crisis, Señor Gimeno, Count Romanones' representative in the Cabinet, having stood firm against such an insult to Parliament. The crisis, however, was settled on the secret understanding that the decree would be granted while Señor La Cierva would negotiate the self-dissolution of the Juntas. Then the conflict was suddenly aggravated on its civil side, the Government having decided to be as firm with the civil Juntas as it had been weak with the military ones. At the instigation of Señor La Cierva, the telegraphs were put under War Office authority and all civil Juntas were declared officially dissolved (March 14), while Señor La Cierva obtained from the military officers an apparent submission under the form of a reduction of their own Juntas to the status of "Committees of Technical Studies." On Feb. 17 the postal services declared a strike. Señor La Cierva's efforts to cope with this by means of military improvisations ended in utter failure, and at the very first sitting of the Cortes (March 18) the Government fell. All possible combinations were tried and failed, until on March 21 at midnight, at a meeting of ex-prime ministers called by the King in his study, after, it is said, having threatened his abdication, King Alfonso succeeded in forming a "ministry of all the talents," composed as follows: Maura (Premier), Dato (Foreign Office), Besada (Finances), Cambó (Public Works), Alba (Education), Marina (War), Pidal (Navy). The solution given to the crisis produced an outburst of popular enthusiasm due mostly to the downfall of Señor La Cierva. This Government had agreed on a concrete programme: reform of the standing rules of the Cortes, amnesty, military reforms, budget. The Government carried them all but the fourth, Señor Alba having left the Cabinet on their refusal to pass his education plans (Oct. 8), which ultimately brought the Cabinet to its end on Nov. 6.

The new Government had to be formed amid the sensation caused by the arrival in Madrid of the news of the Kaiser's flight, and great changes were expected as the result of this. The Reformists having refused to coöperate on the conditions offered them, the changes were limited to the appointment of a Liberal Ministry, on Nov. 9, with Señor García Prieto as prime minister. The world being full of the idea that the triumph of the Allies meant that of democracy, the Government published an "advanced" manifesto. Other signs of the *Zeitgeist* were a bold Land Bill, introduced by Señor Alba, a series of telegrams of congratulations sent by King Alfonso to all the Allied chiefs of state, a meeting of the Conservative party, where a reform of the Constitution was seriously mooted, the waiving by the Government of their right to appoint the Mayor of Madrid, and a revival of the Catalanist question as manifested in a message to the Government addressed by the *Mancomunidad*. This last message produced a split in the Cabinet, Count Romanones, its Foreign Secretary, being in favour of Home Rule. The ministry thus fell on Dec. 3 1918, and it was decided that Count Romanones would form a stop-gap cabinet so as to pass the budget and leave the King free for a change of policy. The first important act of Count Romanones was his visit to President Wilson, then in Paris.

It is clear that from the middle of 1917 on, home problems occupied the Spanish mind more than the war. The incidents of the submarine campaign had to be handled by Governments which knew the country to be resolved not to fight, divided as to its sympathies, and rent by revolutionary and constitutional crises. It is to the credit of the successive Governments which ruled Spain during this period that they succeeded in steering clear of all obstacles, home and foreign, overburdened as they were with home problems and foreign advice not always disinterested. On June 29 1917 a German submarine, "UC52," arrived in Cadiz for repairs. Señor Dato allowed its arrival and

departure within 24 hours, and thereupon had a Royal Decree signed forbidding submarine navigation in Spanish waters. The next incident of the kind was the escape of "U53," which had been interned in Cadiz under the above Royal Decree. The escape appears to have been due to an excessive amount of trust in the German commander on the part of the Spanish naval authorities, whom the Government promptly deprived of their commands. On the initiative of the Romanones administration a treaty had been negotiated in London between the Marqués de Cortina and the English Government. This agreement was signed on Dec. 6. Its importance consisted in that it legalized, in the eyes of the pro-Germans, all trade with England, which received food and ore in exchange for coal. Torpedoes continued all the same, and the Spanish Government sent strongly worded notes on the sinking of the s.s. "Giralda" and the s.s. "Duke de Génova" (1918). The s.s. "Larrinaga" was torpedoed while conveying petrol from New York to Santander, on a Government charter (July 25 1918), and thereupon the Spanish Government, alarmed at the heavy losses sustained by the merchant marine, decided to apply to Germany the claim of tonnage for ton. This was the high-water mark of anti-submarine methods adopted by the Spanish Government. Germany had agreed to the ton-for-ton indemnity when the end of the war came. The Spanish merchant marine had lost 65 ships representing 140,000 tons.

From the material point of view, the neutral attitude adopted by Spain contributed to accelerate the progress which was observable in her economics in the pre-war years. This period of exceptional activity comprises two coincident movements. One is a somewhat artificial "inflation" of Spanish industries, due to the demand of the Allies. The other one is the mere continuation of a development already noticeable before the war. Thus certain industries, really national, such as that of olive oil, succeeded at last in establishing themselves in foreign markets. The effect of the war on the country was therefore neither altogether bad nor altogether good. While it served to stimulate a progress which had already set in, it also created artificial conditions which contributed much to social unrest by flooding the country with money too easily earned.

Count Romanones did not precisely find in Paris in 1919 the diplomatic triumph which he had expected, but neither did he return wholly disappointed. He brought back a seat in the Council of the League of Nations for Spain. He found the country astir with a mixture of two political currents, one a democratic, constitutional agitation, born of the Allied victory, another one a revolutionary agitation which could be traced to the unwholesome effect of the Juntas' *pronunciamientos*. The main effect of these two movements was felt in Barcelona, and was represented by Catalanist propaganda, a military under-

current of opposition to it, and lastly a syndicalist agitation which made the two former forget their mutual enmity and unite against it. Two sets of events suddenly revealed the power of the syndicalist agitation: a general strike which paralysed the whole life of the town, and a series of murders of employers. The Government played with two policies. It militarized the strikers, then tried to conciliate them by sending to Barcelona three liberal-minded civil authorities—Señor Morote, Señor Montañes (Civil Governor) and Señor Doval (Chief of Police). A violent conflict arose between the military and the civil authorities, and when the strike had been settled by the latter, the Government suddenly resigned. It

was known afterwards that this resignation was due to the military having expelled the civil authorities from the town. Señor Maura took office on April 15, asked for a decree dissolving the Cortes, and to the consternation of all parties, obtained it. This amounted almost to a *coup d'état* on the part of the King. After a general election held under a strict censorship, under the protest of all the Left parties (including the Monarchical Liberals), and with the use of electioneering methods which had fortunately been long forgotten in Spain, Señor Maura failed to

bring to the new Cortes more than about one-eighth of its total membership under his banner. His Government fell scandalously under a discussion of his electioneering methods (July 15), and Señor Sánchez de Toca (Señor Dato being ill), formed a Conservative Cabinet, which had to deal with a grave situation in Barcelona, where syndicalist trouble was again brewing. But a new outburst of the Juntas forced the Government to resign, and Señor Allendesalazar (a follower of Señor Maura) took office with a Coalition Cabinet. The change of policy which the change of Cabinet implied determined an aggravation of the conflict. Murders continued. A mutiny organized by syndicalist soldiers took place in a barracks in Saragossa. Disorders broke out in Valencia and Santander. Another militaristic outburst, the publication of secret letters by Gen. Milans del Bosch (Capt.-General of Catalonia) and the subsequent dismissal of that officer by the Government, which in its turn caused the resignation of Señor Gimeno, imposed by the military, ended the life of the Cabinet, which, having passed the Budget, left office on March 4 1920. Two schools of thought manifested themselves then: one favourable to occasional coalitions, taking office in order to carry out definite programmes, another one favouring the reconstruction of the old system of two rotating parties. The King favoured this second school, represented by Señor Dato and Señor García Prieto, and the former was called to power. But the general election which he called forth at the end of 1920 showed that the main-spring of that old system—i.e. the docility of the electorate to any kind of government—could no longer be counted upon. Señor Dato failed to obtain a working majority, his supporters numbering 177 members out of 405. All his efforts were accordingly bent towards the reconciliation of the several factions within the Conservative party. While engaged in this task he was assassinated by anarchists on March 8 1921.

*Dato Prime Minister.*

#### SPANISH LITERATURE

The dominant feature of Spanish contemporary literature in 1910-21 may be found in an effort to achieve the fusion of the critical with the creative element in the race (see S. de Madariaga, "Introduction to Spanish Contemporary Literature," *London Mercury*, Sept. 1920). With the death of Galdós, the sceptre of Spanish literature falls on Miguel de Unamuno (b. Bilbao, 1864), a professor of Greek in the university of Salamanca, a voracious reader, familiar with all European, American and classical literature, and an indefatigable writer. Unamuno represents the modern version of the Spanish mystic writer. His main concern is the relation of man to creation. It is the subject of his masterpiece *El Sentimiento Trágico de la Vida*, a book of passionate meditation, and, at any rate as an attitude of mind, it dominates his criticism (*En torno al Casticismo, Ensayos*), his novels (*Abel Sánchez, Tres Novelas y un Prólogo*) and his plays (*Fedra*). In these works Unamuno appears as the apostle of an ideal of life more closely connected with spiritual Easternism than with the intellectual and social tenets of the West. He thus fulfils in Spain much the same function which Dostoevsky held in Russia, for Spain, like Russia, stands as a transition between East and West. His ideal is in intensity rather than in extension, in individual achievement, the saving of one's soul, rather than in social work and collective material progress. His style corresponds to his beliefs. It reminds one of Carlyle's in that it is written with the whole man's being, body and soul, but it is never eloquent and rhetorical; rather does it tend to conversational familiarity and evinces now and then a proclivity towards being led to new thoughts by the mere shuffling of words.

Should we care to complete the parallel with Russia by finding a Spanish westerner to oppose to Unamuno, as Turgenev stands to Dostoevsky, a younger man than the Basque master, José Ortega y Gasset (b. 1883), would have to be mentioned. A professor of Philosophy at the university of Madrid, Señor Ortega y Gasset is a refined humanist, strongly influenced by German contemporary neo-Kantian schools of thought. His style is naturally polished and his mind penetrating and acute.

*Troubles in Barcelona.*

*Fall of Romanones Government.*

His main work is in the field of criticism and psychology (*Modificaciones del Quijote, El Espectador*). To this same school may be ascribed José Martínez Ruiz (b. 1876), better known under his literary name as "Azorín." His art has all the finish and exquisiteness, all the smallness also, of miniature-painting. He has had the rare merit of applying it to the interpretation of national scenes and places (*Castilla, Los Pueblos*), and has thus contributed in no small measure to the movement for national self-knowledge which is noticeable in contemporary Spain.

In fiction, though belonging to an older generation, Vicente Blasco Ibáñez (b. 1866) must be mentioned, since he continued to wield a never-idle pen. His creative vigour was unabated. His war novel, *Los Cuatro Jinetes del Apocalipsis*, made him famous with the English-speaking public. Older novels have been translated, such as *Sangre y Arena* (as *The Matador*) and *La Barraca* (as *The Cabin*). Blasco Ibáñez represents a kind of art which is Spanish only in its subject, but not in its spirit, manner or style. He is more closely related to the French *naturaliste* school than to any Spanish literary tradition. Of a younger generation, Pío Baroja (b. 1872) is perhaps the most widely read. A Basque, with all the acuity of mind of his race and not a little of its rustic independence and antagonism to civilization, Baroja writes abundantly and carelessly, with more spirit than art. He is more capable of rendering with remarkable accuracy separate aspects of truth than of weaving them into an organic unity endowed with life. His best work is perhaps *Idilios Vascos*, where he has rendered the quaint charm of his own country. Ramón Pérez de Ayala (b. 1881), a critic of great talent, has written several novels, the best of which are *Novelas Poemáticas* and *Belarmino y Apolonio*.

Jacinto Benavente (b. 1866) is still the dominating figure of the Spanish theatre. His most famous play, *Los Intereses Creados* (1907), is not representative, for it illustrates but one phase of the talent of this many-sided author. A more powerful tragedy, *La Noche del Sábado*, is of the same period. In more recent times he has given an intense drama of love in *La Malquerida*. There is, however, a type of play in which Benavente must yield the prize to the brothers Álvarez Quintero (Serafín, b. 1871; Joaquín, b. 1873). As authors of *Comedias de Costumbres* these two writers, who always work together, are unsurpassed. The list of their comedies is long (*Las de Caín, Puebla de las Mujeres*). Other playwrights of note are Linares Rivas (b. 1866), remarkable for his skill in the handling of dialogue; Martínez Sierra (b. 1881), a delicate psychologist; and Pinillos ("Parmeno," b. 1875), a vigorous painter of social conflicts. But drama and comedy are but one, and not the more important, aspect of the Spanish theatre. Still more typical of the nation is what is modestly known in Spain as *género chico* (small genre), a full growth of theatrical production, generally short and accompanied with music, and ranging from variety pieces akin to operettas to little masterpieces of musical drama. Its best-known exponents are the brothers Quintero and Carlos Arniches (b. Alicante, 1866).

The two main currents which influenced Spanish poetry towards the close of the 19th century, i.e. the national tradition and the symbolist school of France, more or less interpreted by South American poets, such as Rubén Darío (b. 1867), remained still observable up to 1920, though the first was more vigorous and conscious, the second widened so as to include all influences, from those of d'Annunzio to those of Maeterlinck and even Rabindranath Tagore. As more typically national, we shall mention Miguel de Unamuno (*Rosario de Sonetos Líricos, El Cristo de Velázquez*), strong and somewhat unharmonious, but true and austere; Antonio Machado (b. 1875) (*Soledades, Campos de Castilla*), whose pessimistic serenity is in keeping with the landscape of central Spain which inspires his poems; and Salvador de Madariaga (b. 1886), whose *Romances de Ciego* restate, in a new spirit, the old Spanish theme of Jorge Manrique. Other poets appear under more complex influences. Thus Manuel Machado (b. 1874), whose main inspiration is popular and southern, has, however, written excellent verse in which the influence of French elegant sensibility is discernible. Juan Ramón Jiménez

(b. 1881), more remarkable for his exquisite sensibility than for his power (*Arias Tristes, Elegías*), is led by his melancholy moods towards fluid rhythms which, though more subtle, remind one of Maeterlinck and, through him, of Rossetti. Ramón del Valle Inclán (b. 1870), perhaps the most skilful musician amongst modern Spanish poets, has given in *La Marquesa Rosalinda* an admirable example of the adaptability of the Spanish language to the most refined rhythms. Ramón Pérez de Ayala (b. 1881), in *El Sendero Innumerable*, succeeds in effecting a happy wedding of thought with harmonious poetry, in a work not wholly uninfluenced by Francis Jammes, d'Annunzio and Walt Whitman.

Among historians of literature the work of Marcelino Menéndez y Pelayo is continued by D. Ramón Menéndez Pidal (b. 1869), whose works on the Poem of Myo Cid and on the Spanish chronicles have thrown great light on the origins of Spanish epic poetry. Francisco Rodríguez Marín (b. 1855), the editor of *Don Quixote*, a specialist in Spanish folklore, has succeeded the master as head of the National Library. In the younger generation, Federico de Onís (b. 1885) has edited Fr. Luis de León, and Américo Castro (b. 1885) has worked on Lope de Vega.

Journalism, always a great art in Spain, where the paper is infinitely more read than the book, is cultivated by all writers, and every one of the names quoted above might be quoted here again as a journalist. Mention must be made, however, of two eminent contemporary writers whose work is almost exclusively journalistic—Ramiro de Maeztu (b. 1874), a versatile mind whose educating influence on the Spanish reading public has been incalculable; and Luis Araquistáin, a powerful dialectician and a master of the polemic style. (S. DE M.)

**SPECTROSCOPY** (see 25.619).—As developed in more recent years (1910-21) the science of spectroscopy has for one of its chief purposes the analysis of spectra, and the deduction therefrom of the nature of the atoms and molecules which generate the spectra. The progress which has been made in this connexion has depended upon improved determinations of the wave-lengths of spectral lines, the further investigation of the varying spectrum of the same substance when excited to luminosity in different ways, the more complete analysis of certain spectra into regular series systems, and, finally, on theoretical investigations. In another direction, important advances have been made in the interpretation of the spectra of the various classes of celestial bodies, which may be regarded physically as experiments on large masses of matter at various high temperatures.

**Standards of Wave-Length.**—Extensive interferometer determinations of wave-lengths in the arc spectrum of iron, based upon 6438.4996 "international" angstroms for the red cadmium line, have been made by K. Burns<sup>1</sup> and others, which provide valuable standards for the general determination of wave-lengths by interpolation. It has been found, however, that the wave-lengths of many lines differ considerably in different parts of the arc, so that special precautions are necessary in order to obtain comparison spectra in agreement with the tabulated standards. Probably the most accurate set of standards are those given by St. John and Babcock<sup>2</sup> who used a small central zone of a "Pfund" iron arc operated between 110 and 250 volts, with five amperes or less, at a length of 12 mm. This list contains 1026 lines, from  $\lambda 3370$  to  $\lambda 6750$ , and for most of them the wave-lengths are believed to be accurate to 0.001 angstrom.

**Flame, Arc and Spark Spectra.**—The range of spectroscopic research has been almost indefinitely extended by the discovery that in nearly all cases the same substance yields different spectra when stimulated in different ways. Such differences are of little importance from the point of view of chemical analysis, but they have become of great significance to the physicist, and have also greatly aided in the interpretation of the spectra of celestial bodies.

The three typical methods of producing luminosity for the observation of the spectra of metallic elements or their salts are the flame, the electric arc and the electric spark. As a general rule, the three sources exhibit important differences. In the flame the lines are comparatively few in number; in the arc the flame lines remain prominent, but many more lines, including some which are as strong as the flame lines, make their appearance. In the spark, there is a tendency for many of the typical arc lines to disappear, whilst other lines may be much intensified, and entirely new lines may also be present. The important class of lines which are intensified, or which only appear, under the violent action of the condensed spark were

<sup>1</sup> *Lick Obs. Bull.*, No. 247 (1913); *Zeit. f. Wiss. Phot.* xii., 209.

<sup>2</sup> *Astrophys. Jour.* liii., 260 (1920).

designated *enhanced lines* by Sir Norman Lockyer, and this name has been generally adopted. The different classes of lines are thus commonly known as flame, arc, and spark (or enhanced) lines, according to their relative prominence in these three sources. This classification, however, is in some respects imperfect, and more definite designations will doubtless eventually be based upon the theoretical considerations to which reference will be made later.

There are many possible variations of these experimental methods of producing spectra, but it would seem that the equivalent of one or other of the three typical sources, or of some intermediate stage, is almost invariably obtained. A more detailed temperature classification of the lines has been based upon experiments with the electric furnace by King<sup>1</sup> but the terms flame, arc and spark lines suffice for most purposes of description.

Similar variations have also been observed in the spectra of gases when submitted to the action of discharges of varying intensity, and the different classes of lines are sometimes distinguished by analogy as arc and spark lines, although with few exceptions the arc is not actually employed. Independent justification for these names, however, is found in the fact that the arc spectra of some gases can be directly observed. The primary and secondary spectra of hydrogen, for example, have both been observed in the arc,<sup>2</sup> and some of the principal series lines of oxygen have also been observed in the spectra of metallic arcs in ordinary air.<sup>3</sup> The actual spectrum given by a gas depends upon its pressure as well as upon the intensity of the discharge by which it is made luminous. Generally speaking, the greater the pressure of the gas, the greater will be the strength of the discharge required to produce the "spark" lines.

One important aim of modern spectroscopic research has been to search for an explanation of these phenomena, for it cannot be doubted that the causes of the variations in the spectra are intimately connected with atomic structure. In this connexion it will be instructive to refer first to the spectra of known compounds. There are many compounds which can be excited to luminosity without total decomposition,<sup>4</sup> and it has been found that each compound gives a characteristic spectrum by which it can be identified as such. These spectra invariably consist of bands, and different sets of bands characterize, for example, the oxides, chlorides and fluorides of the alkaline earth elements.

It is sufficiently obvious that if a compound be stimulated so strongly that it becomes dissociated, the spectrum will change from one consisting of bands representative of the compound to one containing the lines of the constituent elements. It is not only compounds, however, that show changes of this character. Experiments on nitrogen, for instance, show a range of spectra from one consisting wholly of bands to one in which lines occur alone. Even hydrogen has two spectra: (1) the highly complex, so-called secondary spectrum, which doubtless represents a banded spectrum of rather coarse structure<sup>5</sup>; and (2) the familiar line spectrum, constituting the Balmer series. Similar results have been obtained for many other elements, and from analogy with the spectra of compounds the natural conclusion is that the band spectra of the elements arise from molecules, while the line spectra are produced by the atoms which are set free when the molecules are dissociated.

If this be a true view, the change in the structure of the atom, or in its mode of vibration, which accompanies the successive modifications of the line spectrum becomes a question of paramount interest. Lockyer<sup>6</sup> did not hesitate to believe that while the arc lines of an element were to be attributed to ordinary atoms, the enhanced lines could only be produced by the splitting-up of the atoms themselves, and he called these simpler forms of matter the proto-elements. Proto-calcium, for instance, denoted calcium which had been broken up into sub-atoms by the application of a sufficient stimulus. A somewhat similar, but more probable, explanation has been based upon an application of the quantum theory by Bohr to Rutherford's nucleus theory of the atom. This theory is founded largely on the analysis of spectra into regular series.

*Range of Observations.*—For the complete determination of the laws of spectra it is necessary to extend the observations far beyond the limits of the visible spectrum. Conspicuous success in the direct photography of the near infra-red spectrum has been achieved by Meggers and others, by the use of ordinary plates stained with dicyanin.<sup>7</sup> By this method excellent photographs of the arc spectra of a large number of elements, extending to  $\lambda 10,000$ , have been obtained with a concave grating, and the positions of the lines have been measured with a high degree of accuracy. For the present,

the extreme infra-red can only be investigated by thermal effects, involving the use of the thermopile, bolometer, or radio-micrometer, as in the researches of Paschen, Lehmann, and Randall.

Spectroscopic observations in the direction of the ultra-violet, beyond the limit about  $\lambda 1850$  set by the absorption of quartz, and beyond about  $\lambda 1700$  set by the absorption of air, which were first made by Victor Schumann, have been greatly extended by the use of concave gratings, and wave-lengths of considerable accuracy have been determined. Lyman has recorded lines as far as  $\lambda 500$  angstroms, and in similar work at Toronto, McLennan has observed a line attributed to carbon at  $\lambda 584$ . A still greater extension has been made at Chicago by Millikan<sup>8</sup> and his colleagues, who have observed lines of nickel as far as  $\lambda 202$ . Several improvements in technique were necessary to this success. It was achieved, in the first place, by using gratings specially adapted for the purpose; secondly, by working in an essentially perfect vacuum, through the use of powerful pumps; and finally, since no ordinary spark could pass in a vacuum, by the use of a specially strong sparking apparatus which was capable of forcing a discharge across a very small space between the electrodes. Such a spark was found to produce the extremely short X-rays in the case of carbon, so that the gap which had previously existed between ordinary light waves and X-rays was for the first time bridged.

Spectroscopic data thus cover a very wide range, and offer many interesting problems to the investigator. Their solution depends on his ability to make a true analysis of spectra, and to deduce therefrom the corresponding atomic or molecular conditions.

*Analysis of Spectra.*—Considerable progress has been made in the analysis of spectra into series. One of the most important advances in this direction is the increased knowledge of the primary spectrum of hydrogen, which is now known to contain, not only the Balmer series, but also two similar series, one in the infra-red and the other in the far ultra-violet. The former was discovered by Paschen, and the latter, previously predicted by theory, was found by Lyman with his vacuum spectrograph. Each of these series is well represented by a mathematical formula, which is simplified if the lines are expressed by their "wave-numbers" ( $\nu$ ) instead of their wave-lengths. The wave-number is the number of waves per centimetre in vacuum, and is proportional to the frequency of the vibration. In practice, it is obtained by dividing the wave-length (in angstrom units), connected to a vacuum, into  $10^8$ . In these terms, the formulae for the hydrogen series are as follows:—

$$\text{Lyman series: } \nu = \frac{N}{1^2} - \frac{N}{m^2} \quad (m=2, 3, \dots).$$

$$\text{Balmer series: } \nu = \frac{N}{2^2} - \frac{N}{m^2} \quad (m=3, 4, \dots).$$

$$\text{Paschen series: } \nu = \frac{N}{3^2} - \frac{N}{m^2} \quad (m=4, 5, \dots).$$

Thus, a general formula for the primary hydrogen spectrum, which

might include other undiscovered series, would be  $\nu = \frac{N}{m_1^2} - \frac{N}{m_2^2}$ .

$N$  is a constant, whose value<sup>9</sup> is 109678.3,  $m$  is a constant integer for any one series; and  $m_2$  has a different integral value for each line of a series. R. W. Wood<sup>10</sup> has recently extended the Balmer series to  $m=22$ , i.e. to 20 lines, by experiments with long vacuum tubes. In the spectrum of the sun's chromosphere, 34 lines of the series have been recorded.

There is only one other known spectrum which has the same simplicity as that of hydrogen—namely, the enhanced spectrum of helium. This includes the series first found by Pickering in the star  $\zeta$  Puppis, and the line  $\lambda 4686$  and others calculated by Rydberg, by whom both series were attributed to hydrogen. These lines were produced in the laboratory by Fowler,<sup>11</sup> and additional lines of the Pickering series, first indicated by Bohr's theory, were afterwards observed by Evans<sup>12</sup> and by Paschen.<sup>13</sup> It was, in fact, the theoretical work of Bohr which first suggested that the lines in question originated in helium and not in hydrogen.

The enhanced series of helium can be represented by a formula similar to that for hydrogen, with the difference that the series constant has rather more than four times the value for hydrogen.

Thus, the series which includes  $\lambda 4686$  is given by  $\nu = 4N' \left( \frac{1}{3^2} - \frac{1}{m^2} \right)$

when  $N'$  is 109723. The complete Pickering series is given by substituting  $1/4^2$  for  $1/3^2$  in this formula, and a further series calculated by the use of  $1/2^2$  has been partially observed by Lyman. It should be noted that alternate lines of the Pickering series are nearly coincident with the Balmer series of hydrogen.

Other spectra exhibit several series superposed. The three types of series early recognized as occurring in the same spectrum were denoted by Schuster as the "Trunk," "Main Branch," and "Side Branch" series, but these names are now entirely superseded by the titles: "Principal," "Sharp," and "Diffuse," originally assigned by Rydberg. A fourth type of series, called the "Fundamental" or "Bergmann" series, has since been recognized. The four chief types are closely interrelated, but apparently have a certain measure of independence. Each series may consist of singlets, doublets, or triplets.

In each series the lines converge to a definite limit, and their wave-numbers are obtained by subtracting a sequence of "terms" from the wave-number of the limit. The formulae for series in general, however, are not known with the same accuracy as for hydrogen and enhanced helium. In some spectra, notably the arc spectra of the alkali metals, a close approximation to a series is given by such a formula as that of Hicks,<sup>1</sup> namely,  $\nu = A - N/(m + \mu + a/m)^2$  where  $N$  has nearly the same value as for hydrogen, while  $\mu$  and  $a$  are constants and  $A$  is the limit of the series; as before  $m$  takes successive integral values. In some series, however, such a formula by no means gives an accurate representation of the observed lines. All that the theoretical investigator can accept with confidence at present is that the general term formula is  $N/f(m)^2$ , where  $f(m)$  is a function of  $m$  whose form is known only for hydrogen and enhanced helium.

The four main sequences of terms are denoted, for brevity, by the symbols  $1P$ ,  $mS$ ,  $mD$ ,  $mF$ , where different integral values of  $m$  correspond to the different terms in each sequence. The limit of each of the four series is the first term of one of the others, so that in the abbreviated notation, we have:—

Principal series	= $1S - mP$
Sharp series	= $1P - mS$
Diffuse series	= $1P - mD$
Fundamental series	= $2D - mF$

The term  $1P$  has one, two, or three values, according as the series consists of singlets, doublets, or triplets; and similarly, the term  $2D$  has two or three values, in doublet and triplet series respectively, when satellites are present in the diffuse series.

It was first shown by Ritz, and expressed in his "combination principle," that lines often occur in positions corresponding to other differences of terms besides those giving the four main series. Thus, there may be a series  $2S - mP$ ,  $1P - mP$ , and so on. Many lines not previously included have in this way been proved to form part of general series systems.

The recognition of the importance of "terms" is a definite step towards the simplification of spectra, since the number of terms is less than the number of lines included in the series and combinations. Moreover, theoretical investigations indicate that the terms have a more immediate physical significance than the lines themselves. On this account, it is of great interest to construct a "term-spectrum," in which the terms, instead of the lines, are plotted along a horizontal scale. Such a term-spectrum—for the element lithium—is shown in the appended diagram. For economy of space, the terms are represented horizontally by their logarithms instead of their actual values.

In the term-spectrum diagram, the four main sequences are distinguished by the varying heights of the strokes by which their terms are represented. The highest principal term ( $1P$ ) minus the sets of sharp and diffuse terms, gives the sharp and diffuse series of lines respectively, while the highest sharp term ( $1S$ ) minus the set of principal terms, and the highest diffuse term ( $2D$ ) minus the set of fundamental terms, give the principal and fundamental series. These four series are generally well developed, but, as already remarked, other combinations often arise. It appears, however, that all the combinations which are mathematically possible do not occur with the same frequency.

**Origin of Spectra.**—The theory of Bohr,<sup>2</sup> which has already been mentioned, offers a remarkably accurate explanation of the spectra of hydrogen and enhanced helium, and gives a physical meaning to the terms which has proved very fruitful in suggesting new direc-

tions of research. According to this theory, the atom of an element consists of a positively charged nucleus surrounded by an appropriate system of electrons, such that the total negative charge of the electrons is equal to the positive charge of the nucleus. Nearly the whole of the mass of the atom is concentrated in the nucleus, which is very small in comparison with the distances separating it from the electrons. When an electron is removed from its normal position by the application of an external stimulus, it may traverse temporarily one or another of certain orbits determined by quantum considerations. In each of these orbits it has a certain amount of energy, which is assumed to remain constant while the electron revolves in the orbit. The terms of the spectrum are then taken to be proportional to the respective amounts of energy. When the electron returns to its normal position, it comes to an orbit in which, for equilibrium, it must possess less energy than it had in the temporary orbit. The difference of energy, which is proportional to the difference of the corresponding terms, is emitted as a homogeneous radiation, and gives rise to a definite spectral line, while, if the electron occupies successively different orbits on its return, several lines will be produced in succession. The actual spectrum at any moment is the summation of the different lines yielded by atoms in different states. The term spectrum can thus be regarded as a diagram of the atom, in which the nucleus is at the zero of the scale (to the right in the diagram), and the strokes are parts of the possible orbits. A spectrum line appears when an electron passes from one orbit to another on its return towards its normal position in the innermost orbit.

The differences between the arc and enhanced spectra receive a simple explanation on the Bohr theory. The lines of an arc spectrum are supposed to be generated by the disturbance of a single electron and its subsequent interaction with the nucleus and remaining electrons. When two electrons are removed from their normal positions, and one remains at a great distance, the return of the second electron generates an entirely different spectrum consisting of the enhanced lines. An atom which has lost one or more electrons is said to be "ionized."

Assuming the hydrogen atom to consist of a nucleus and a single electron, the energies of the possible orbits can be calculated, and are found to be proportional to the observed terms  $N/m^2$ . Helium, the next lightest element to hydrogen, is believed to have two electrons, and the mathematical problem of determining their motion has not yet been solved. If one of the electrons is removed, however, the atom is similar to that of hydrogen, except that the nucleus has a double positive charge and a greater mass. The resulting enhanced terms are therefore calculable. They again have the form  $N/m^2$ , but  $N$  has now a much larger value than it has for hydrogen.

It is represented in both cases by the expression  $\frac{2\pi^2 e^2 E^2}{h^2 c^3} \cdot \frac{mM}{m+M}$

where  $e$ ,  $m$ , and  $E$ ,  $M$ , are respectively the charge and mass of the electron and nucleus,  $h$  Planck's constant and  $c$  is the velocity of light. In the case of hydrogen  $E=e$ , and when the experimental values of the various quantities are substituted in the formula, the series constant is reproduced with remarkable accuracy. The second factor increases with  $M$ , so that it will be slightly greater for helium than for hydrogen. Also, the double nuclear charge makes the first factor in the expression for  $N$  four times as great for enhanced helium as it is for hydrogen. These theoretical requirements have been completely verified by experiment. Fowler, calculating  $N$  for hydrogen and helium from the observed lines, used the theoretical expressions to calculate the value of  $M/m$ , i.e. the ratio of the masses of the hydrogen atom and the electron—and obtained a result in very close agreement with that arrived at by direct measurement. Moreover, he has shown<sup>3</sup> that in the more complicated spectra of the alkaline earths, the enhanced line terms are also represented by formulae in which  $N$  has four times its value for arc spectra.

It has not yet been possible to calculate the theoretical terms of other spectra, on account of the mathematical difficulties connected with the interaction of more than two bodies. The same principles, however, are believed to apply to atoms containing many electrons, and the physical conceptions of the theory have led to valuable information regarding the order of excitation of the lines under gradually increasing stimulus.

Further developments of the theory, taking into account the variation of the mass of the electron with velocity required by the theory of relativity, have indicated that the lines of the hydrogen and enhanced helium series are complex, and under high resolution should appear to consist of several components. This has been verified by Paschen,<sup>4</sup> who found results for helium in remarkable agreement with the predictions of Sommerfeld. The intensities of the several components also are in the ratio calculated by Sommerfeld by a special hypothesis.

**Resonance and Ionizing Potentials.**—Strong support for the Bohr theory is given by experiments in which atoms are bombarded by electrons, with a view to temporary disintegration. If an electron, of charge  $e$  falls through a potential difference,  $V$ , it acquires a

							Triplets?

quantity of energy,  $e\nu$ , expressed in appropriate units. If such an electron bombards a neutral atom, it is found that no change takes place until  $\nu$  reaches a certain value, when there is a sudden radiation of energy corresponding to a particular line—usually a strong flame line—in the spectrum of the bombarded atom. According to Bohr's theory, the energy in this particular radiation is equal to  $h\nu$ , where  $\nu$  is the wave-number of the line, and  $h$  is Planck's constant. Experiments with several elements show that this critical value of  $\nu$  is determined by the relation  $e\nu = h\nu$ . This means that the energy of bombardment has been just sufficient to remove the electron in the atom from its normal position to the next orbit, and, on its return, the electron restores the energy in the form of monochromatic radiation of the appropriate frequency. If  $\nu$  is expressed in volts, the wave-number of the emitted line is numerically equal to  $\nu \times 10^{10}$ . The value of  $\nu$  when emission first takes place is known as the "resonance" or "radiation" potential. Further, by increasing  $\nu$ , it is possible to remove an electron from the atom altogether. If the energy,  $e\nu$ , in this case is equated to  $h\nu$ , the resulting value of  $\nu$  is found to be equal to the largest term in the spectrum—usually the term 1S, the limit of the principal series. This term would correspond to the innermost orbit of the electron, and the result suggests that the energy which must be applied to remove an electron from the atom is just equal to the energy possessed by the electron when revolving in its normal position. The potential required to remove an electron from the atom is known as the "ionizing potential." It has been determined experimentally for a number of elements and has been found to be in complete agreement with the orbital energy as calculated from the largest term in the spectrum. The Bohr theory thus presents a simple picture of the processes taking place in experiments of this type.

**The Stark Effect.**—The resolution of spectral lines under the influence of intense magnetic fields—usually known as the Zeeman effect—has been extensively studied for a large number of elements. Somewhat similar effects, but much greater in magnitude, produced by an electric field, have been brought to light by Stark,<sup>1</sup> and examined in considerable detail by a number of workers. Nicholson and Merton<sup>2</sup> have shown that the Stark effect may operate to an appreciable extent in an ordinary vacuum-tube discharge, causing a broadening of the lines. Both the Zeeman and Stark effects have been treated on the basis of the Bohr theory,<sup>3</sup> with some success.

**Spectra and the Periodic Table.**—Attention is being drawn more and more to the relation of the spectrum to the periodic table of the elements. While it cannot be said that the relation is known with any approach to completeness, a number of important facts have been noted which may ultimately prove of great service in the interpretation of the table. It has long been known that, when doublets or triplets occur in the spectra, the wave-number separations of their components (which are constant in the sharp and diffuse series) are approximately proportional to the squares of the atomic weights of the elements producing the spectra—so long as those elements belong to the same family group. The Zeeman effect also is generally the same for lines of corresponding series in the spectra of elements belonging to the same group. But perhaps the most comprehensive connexion of spectra with the periodic table is established by the "displacement law" of Kossel and Sommerfeld.<sup>4</sup> It has been observed that the "complexity" of the lines of a series—i.e. their character as singlets, doublets or triplets—is constant throughout a group, but varies from one group to another. The displacement law states that, when an element is ionized, the enhanced series take on the same type of complexity as the arc series produced by the element to the left (i.e. in the preceding group) in the periodic table. It is assumed that electrons arrange themselves round the nucleus in rings, and that spectrum phenomena are produced by electrons in the outer ring. If the outer ring contains an odd number of electrons, the spectrum will consist of doublets, while, if the number is even, the spectrum will show triplets and singlets. In the periodic table each element contains one outer electron more than its neighbour in the preceding group, while a group consists of elements having the same number of electrons in the outer ring. It follows that the removal of an electron from an

element will make the outer ring similar to that of the immediate forerunner of the element in the table, and so make the enhanced lines of the first element of the same type of complexity as the arc lines of the second. Removal of a second electron would restore the arc type of complexity, for the number of outer electrons would again become odd or even, as the case might be. A second ionization is difficult to bring about in most cases, but with silicon it is probable that one, two, and even three electrons have been removed, step by step, thus making possible four distinct spectra. These appear to show the alternation of complexity required by the displacement law. The table above gives the types of series produced by the neutral and ionized elements of the various groups, so far as they are known at present.

The spectra of the higher groups are much more complex than those of the lower ones. Their series, if they possess any, are possibly of a different type from those with which we are familiar. The displacement law, however, suggests that, by repeated ionizations, series—and therefore terms—might be detected in such spectra, of the same kind as those of the groups of elements on the left. But since, with each successive ionization, the term constant,  $N$ , is multiplied in the ratio 1:4:9:16—etc., the chief series lines might tend rapidly to approach the far ultra-violet and become difficult to observe.

**Band Spectra.**—Several band spectra have been studied in further detail, but it does not appear that any very fundamental advance in our knowledge of the structure of these spectra has been made. The discovery of a band spectrum of helium,<sup>5</sup> however, is probably of considerable importance. It has been shown by Fowler<sup>6</sup> that, while the individual bands follow the ordinary laws of band spectra, the heads of some of them are arranged in accordance with the laws of line series. In this respect the helium bands appear to be quite unique. Unlike the lines of helium, the bands have not yet been traced in any celestial source.

**The Solar Spectrum.**—A striking feature of continued work on the solar spectrum is the identification of a large number of faint lines with lines composing the bands of certain compounds, in addition to the band lines of carbon and cyanogen previously recognized by Rowland and Lockyer. The peculiarities of the region about the G group of Fraunhofer have been shown by Newall<sup>7</sup> to be due to the absorption of the well-known hydro-carbon band  $\lambda 4315$ , and the group P has been found by Fowler and Gregory<sup>8</sup> to include the strong ultra-violet band of ammonia having its maximum near  $\lambda 3360$ . In addition, the band of luminous water vapour beginning at  $\lambda 3064$  has been found by Fowler<sup>9</sup> to be present in the solar spectrum. A large number of previously unknown solar lines have thus been accounted for, and it is not improbable that the thousands of faint lines which remain unidentified may eventually be traced to other band spectra.

An interesting application of modern theories of spectra to solar problems has been made by M. N. Saha.<sup>10</sup> On the reasonable assumption that the composition of the sun is essentially the same as that of the earth, it remains to account for the absence of spectral indications of many of the elements. Dr. Saha urges that the varying representation of different elements arises from the varying response of these elements to the solar stimulus, depending upon the structure of their atoms, and the consequent difference in their ionizing potentials. Cesium, for example, has a low ionizing potential and is considered to be completely ionized in the sun, so that the familiar lines do not appear, while the chief lines of the ionized element are out of range. In contrast, sodium has a higher ionizing potential and is only partially ionized in the sun, so that the lines of the neutral atoms appear strongly. Other elements, such as neon and argon, have very high ionizing potentials, and are not excited at all. Dr. Saha finds support for his views in calculations of the percentage ionizations of various elements at different temperatures and pressures, and it is possible that the peculiarities of the solar spectrum may be satisfactorily explained by these considerations.

**Stellar Spectroscopy.**—Our detailed knowledge of the spectra of the stars has been greatly advanced by the use of the large telescopes which have been erected, and considerable progress has also

been made in the interpretation of the stellar lines through experiments in the laboratory. In particular, the use of stronger discharges than had previously been employed has led to the discovery of new lines of several elements, which have been identified with the lines occurring in the hotter stars. Certain lines of the Wolf-Rayet stars, for example, have thus been traced to carbon by Merton,<sup>1</sup> and others to oxygen by Fowler and Brookbank.<sup>2</sup> The general outcome of the experimental reproduction of stellar lines is to support the view that the order in which the different classes of stars had been arranged is a true temperature sequence. This order, previously indicated by Secchi and Vogel, is now generally expressed by the classification introduced at Harvard by E. C. Pickering, in which the most important classes, passing from the white to the redder stars, are designated by the letters B, A, F, G, K, M.<sup>3</sup> On passing from the relatively cool M stars to the hot B stars, it is necessary, in accordance with the work of Lockyer, to employ a gradually increasing stimulus in order to excite the spectra which appear at successive stages of the stellar sequence.

There are certain peculiarities of the successive stellar spectra which call for explanation, if it be assumed that all stars are of essentially the same composition. Thus, at every stage of the stellar sequence there are many elements which are not represented at all, and different selections of the elements appear at the various stages. The earlier attempts to deal with such questions are incompatible with modern views as to the origin of spectra. The new theory of spectra, however, supplemented by a theory of the temperature radiation of gases, has been shown by Dr. M. N. Saha<sup>4</sup> to provide a very probable explanation of most of the phenomena. According to this theory, a gas or vapour may emit radiations, or become ionized, by subjecting it to appropriate thermal stimulus, depending in part upon the density, and the emissions produced mechanically by the spark may thus also be generated by the action of a sufficiently high temperature. Dr. Saha concludes that, under the temperature stimulus prevailing in the atmosphere of any particular star, certain elements are excited to radiation of their characteristic lines, in accordance with their resonance and ionization potentials, while other elements are either ionized, or the stimulus is too weak to excite the lines by which their presence could be recognized. When an element is completely ionized in this way, it will often happen that the most characteristic lines of the modified atoms will lie far in the ultra-violet, outside the range of possible observation, so that the element will escape detection. Again, under the action of the highest temperatures, a second step in ionization may set in, producing still more refrangible chief lines as a rule, so that even the elements which yield enhanced lines in the ordinary range of spectrum at some stages will eventually cease to be represented. The simplification of the spectra of the hotter stars thus receives an acceptable explanation; the surviving elements represented in the spectra are those for which the maximum amount of energy is required to produce the successive ionizations, or those for which these conditions yield lines of sufficient intensity within the range of spectrum which is open to observation. Preliminary calculations of the probable temperatures at which such changes of spectrum would occur are in substantial agreement with the temperatures of the various classes of stars deduced from spectro-photometric observations by Wilsing and Scheiner. It therefore seems probable that temperature is the controlling factor in determining the character of the spectrum given by a star, and, as Dr. Saha remarks: "The stellar spectra may be regarded as unfolding to us, in an unbroken sequence, the physical processes succeeding each other as the temperature is continually varied from 3000° to 40,000°."

**BIBLIOGRAPHY.**—To the works mentioned in the earlier article the following should be added:—Eder and Valenta, *Atlas typischer Spektren* (1917); P. Zeeman, *Researches in Magneto-Optics* (1913); J. Stark, *Die Atomionen chemischer Elemente und ihre Kanalstrahlenspektren* (1913); T. Lyman, *The Spectroscopy of the Extreme Ultra-Violet* (1914); A. Sommerfeld, *Atombau und Spektrallinien* (1921); L. Silberstein, *Report on the Quantum Theory of Spectra* (1920); A. L. Hughes, "Report on Photo-Electricity, including Ionising and Radiating Potentials and Related Effects," *Bull. of National Research Council*, Washington (1921); A. Fowler, *Series in Line Spectra*, Phys. Soc., London (1921). (A. F.)

**SPEE, COUNT MAXIMILIAN VON** (1861–1914), German admiral, was born June 23 1861 at Copenhagen. He was first officer of the battleship "Brandenburg" when it was sent to East Asia in 1899 during the Chinese boxer disturbances. In

1908 he was chief of the staff of the North Sea command, and in 1913 he was appointed chief in command of the Cruiser Squadron. When the World War broke out he was on a voyage with this squadron from Tsing-tau to the South Sea Islands. He was hard pressed by British and Japanese naval forces, but was at an advantage when he was engaged on Nov. 1 1914 off Coronel on the Chilean coast by Adml. Cradock with a British squadron which was inferior to his own in numbers and speed, as well as in range and weight of fire. Adml. Cradock went down with his ship, the "Cape of Good Hope," and the "Monmouth" was also sunk. On the following Dec. 8 Count Spee's squadron was drawn into action off the Falkland Is. by the powerful cruiser squadron of Adml. Sturdee which had been sent out to look for him. Count Spee's own ship, the "Scharnhorst," was sunk; he himself and his two sons going down with all hands. The "Gneisenau" was also sunk, as were the "Leipzig" and the "Nürnberg." The light cruiser "Dresden" escaped, but was afterwards sunk off Juan Fernandez in the Pacific.

**SPIELHAGEN, FRIEDRICH VON** (1829–1911), German novelist (see 25.667), published during his later years *Freigebornen* (1900); *Die schönen Amerikanerinnen* (1902); *Ultimo* (1903); and *Am Wege* (1903). He died at Charlottenburg, Berlin, Feb. 25 1911.

**SPIERS, RICHARD PHENE** (1838–1916), English architect and author. Phené Spiers occupied a unique position amongst the English architects of the latter half of the 19th century, his long mastership of the architectural school at the Royal Academy having given him the opportunity of moulding and shaping the minds of more than a generation of students. He was educated in the engineering department of King's College, London, and proceeded thence to the atelier Questel of the Ecole des Beaux-Arts, Paris, for upwards of three years, a method of study rare for an architectural student in those days. On his return he won the gold medal and travelling scholarship of the Royal Academy, and in 1865 the Soane medal of the R.I.B.A. In 1871, after he had worked in the offices of Sir Digby Wyatt and William Burges, he gained second premium with a spirited design (showing a good deal of the Neo-Grec feeling consequent on his French training) for the new Criterion building, London. His work of about this period included Lord Monkswell's house, Chelsea. Phené Spiers travelled in France, Spain, Egypt, Syria and the East, and besides his record of more purely architectural data, he made many water-colour sketches showing much talent and facility. He was a frequent exhibitor at various galleries, and a good specimen of his art—the loggia at Hampton Court—is in the Victoria and Albert museum. His works and publications were many, and covered a wide ground. Amongst them are his new edition of James Fergusson's *History of Architecture* and the further volumes on Indian and Eastern art; *Architectural Drawing*; *The Architecture of Greece and Rome* (conjointly with the late W. J. Anderson); *The Mosque at Damascus*; and the articles on Persian and Roman Architecture in Dr. Russell Sturgis's *Dictionary of Architecture*, besides an edition of Pugin's *Normandy*. For the *E.B.* Spiers wrote most of the articles dealing with architecture. The position to which his erudition and ability entitled him was fully recognized in other countries as well as his own, as is shown by his election to membership of many foreign societies in France, Spain and America. He died in London Oct. 3 1916.

**SPIRITUALISM:** see PSYCHICAL RESEARCH.

**SPITSBERGEN** (see 25.708).—The highest peaks in Spitsbergen are believed to be Mount Newton, 5,676 ft., and Mount Poincaré, 5,446 ft., both in the eastern part known as New Friesland. Mount Eidsvoll in King James Land is 4,770 ft. and Mount Monaco on Prince Charles Foreland is 3,543 ft.

**Geology.**—Considerable exploration has not greatly modified the main conception of the geological structure. The old rocks of the W., generally described as the Hekla Hook series, seem to be of Silurian age to which may also be ascribed the so-called Archaean rocks of the N.W. There are no Permo-Carboniferous rocks in King James Land and the strips of rocks on the N.E. side of Prince Charles Foreland and the opposite shores of the mainland, formerly attrib-

<sup>1</sup> *Proc. Roy. Soc., A*, xcii., 498 (1915).

<sup>2</sup> *Monthly Notices, R.A.S.*, lxxvii., 511 (1917).

<sup>3</sup> The work of H. N. Russell, in general agreement with that of Lockyer, renders it probable that the true sequence is from M to B with increasing temperature, and thence from B to M with decreasing temperature, the density increasing throughout. Stars of rising temperature, on account of their great volume, have been called "giants," those of falling temperature "dwarfs." Differences between the spectra of giants and dwarfs of the same spectral class have been found by Adams (see *Monthly Notices, R.A.S.*, lxxxi., 334).

<sup>4</sup> *Proc. Roy. Soc., A*, xcix., 135 (1921).

uted to that age, are now known to be Tertiary. Certain of the coal measures in Advent Bay prove to be of Cretaceous and not Tertiary age and these Cretaceous beds probably appear also below the Tertiary beds in Lowe Sound.

An extinct volcano and several hot springs with a temperature of 75° to 82° F. were discovered in Bock Bay, off Wood Bay, in 1910. The volcano seems to date from a later period than any other volcanic manifestation found in Spitsbergen. Research has proved that dislocation has played a great part in determining the main features of the fjord system, especially in Ice Fjord where the course of the fjord has been decided by great faults.

*Climate.*—From the meteorological data now available, including eight years' records from Green Harbour, the following means may be given: Cape Thorsden, Jan. 0.8° F., July 39.9° F.; Green Harbour, Jan. 6.2° July 39.7°; Axel I. (Lowe Sound), Jan. 1.6°, July 40.3°; S.E. of Edge I., Jan. 1.5°, Aug. 37.4°; Bear I., Feb. 10.4°, Aug. 40.1°. The mean annual precipitation at Green Harbour is 11.6 in.; Prince Charles Foreland has more and the interior of Spitsbergen less.

*Exploration.*—There is little doubt that the land called Svalbard ("cool coast") in the Icelandic annals, discovered by Norsemen in 194, was really Spitsbergen. If Spitsbergen was forgotten by the Norsemen it was possibly rediscovered by Russian hunters from the White Sea in the 15th or 16th centuries or at least previous to Barents' rediscovery in 1596.

Recent exploration in Spitsbergen has been devoted mainly to geological work, largely with economic ends in view, and detailed cartographical survey. A German expedition under Lt. Schroeder-Stranz in 1912 came to grief on the N. coast, after the loss of the leader. Half the staff were lost and the survivors were rescued by Norwegians under A. Staxrud.

The principal survey work has been done by Norwegians working in small parties every summer since 1906, assisted by grants from the Norwegian State. These parties have been successively commanded by G. Isachsen, A. Staxrud and A. Hoel, and have mapped in detail the western side of the mainland from the N. coast to the South Cape. The work is expedited by the use of photogrammetric methods to assist triangulation. The detailed survey of Prince Charles Foreland has been completed by Dr. W. S. Bruce and assistants who have also mapped the area between Klaas Billen and Sassen bays. Swedish surveyors have mapped the land round Lowe Sound and Braganza Bay. The Prince of Monaco has shown continued interest in Spitsbergen exploration by giving assistance to several explorers, including the Swiss H. Stoll who in 1913 crossed the unknown country between Lowe Sound and Agardh Bay on Stor Fjord. Lt. W. Fitchner in 1910 surveyed the glaciated region between Temple Bay and Mohr Bay. In 1920 J. M. Wordie scaled several of the highest peaks on the W. coast, including Mounts Monaco, Rudmose and Barents. Hydrographic surveys have been carried out by G. Isachsen and others on the W. coast and in Green Harbour, by W. S. Bruce in Foreland Sound, Klaas Billen and Sassen bays and Stor Fjord. Swedish Government surveyors have been at work in Lowe Sound. Oceanographical work has been done in Spitsbergen waters by Dr. F. Nansen. The Norwegian Government has maintained a wireless telegraph station and meteorological observatory in Green Harbour since 1911. A German meteorological station was founded in Ellefthøi Haven, Cross Bay, in 1910 as the outcome of a visit by Prince Henry of Prussia and Count Zeppelin when experiments with dirigible balloons were conducted. This station was abandoned in Sept. 1914. In 1920 Norway opened a new meteorological and geophysical station for aerological and geomagnetic research. Besides the Norwegian state wireless station at Green Harbour, there were in 1921 seven others (4 Norwegian, 2 English and one Swedish). In Aug. 1921 a Norwegian Church was consecrated at Longyear City.

*Mining.*—The development of the coal-fields has proceeded rapidly; greatly stimulated during the war by the scarcity and high price of coal in Scandinavia. The coal-mine in Longyear Valley, Advent Bay, which had been under American ownership since 1905, was sold in 1916 to Norwegians who have been assiduous in their export. Several other Norwegian mines have started, notably in Kings Bay, Green Harbour and Hjorth Haven in Advent Bay. Swedish mines were opened in Lowe Sound (Braganza Bay) in 1917. There are Russian mines in Green Harbour and Dutch mines at Cape Boheman. British enterprise, hampered by war conditions, revived in 1919 in the coal-bearing areas in Klaas Billen Bay and Lowe Sound. By 1920 practically all the coal-bearing areas were annexed by one or other company and at least five mines had reached the export stage. The total amount of coal exported in 1919 was 90,000 tons, all of which went to Norwegian ports, including some to Narvik for the Swedish railways. The coal exported so far is of

Tertiary and Cretaceous age and proves to be good steam coal. Bituminous coal of Carboniferous age will soon be available for export. Jurassic coal occurs but is of poor quality and no longer worked. Mining continues throughout the year but the export season at present is from June to Sept. The largest mining camp is Longyear City in Advent Bay, housing some 400 men in summer and 300 in winter. No other minerals besides coal are as yet exploited commercially, but large deposits of iron ore (36% iron) and gypsum are known, as well as smaller deposits of zinc and asbestos. Signs of oil have been reported. A Norwegian company is exporting coal from Bear Island. The approximate area (in sq. m.) of estates owned by various nationals in Spitsbergen is as follows: British 6,500, Norwegian 900, Swedish 400, Russian 60 and Dutch 10. Whaling was revived in Spitsbergen waters in 1905, abandoned in 1912 and restarted during the World War. The only station is now in Green Harbour. Winter fur-hunting is pursued by a few Norwegians.

*Political History.*—The question of political control had been discussed since about 1870, mainly by Norway, Sweden and Russia, without any solution being found. Spitsbergen therefore occupied the curious position of being *terra nullius*. In 1907, however, Norway again opened negotiations for an international conference to decide the question of sovereignty, and one was held at Christiania in July-Aug. 1910, followed by another in 1912, without definite result. In July 1914 a conference which included also representatives of Britain, France, Belgium, the United States, Holland and Germany tried to devise a form of administration consistent with the country remaining a *terra nullius*, but the outbreak of the World War put an end to the discussions. In 1919 the Supreme Council conferred the sovereignty of Spitsbergen, including Bear I., on Norway. The signatories of the treaty were Great Britain and the British Dominions, France, Italy, the United States, Japan, Holland, Denmark, Norway and Sweden. The rights and territories of nationals other than those of Norway are safeguarded, and Norway is not allowed to show preferential treatment to Norwegian mining companies or to levy taxes except for expenditure on the administration. Disputed claims to estates were to be decided by a neutral commission presided over by a Dane.

*BIBLIOGRAPHY.*—The literature is in the main scattered in periodical publications: specially useful are *Ymer* (Stockholm), *Videnskapselskaps skrifter* (Christiania), *Naturen* (Bergen), *Scottish Geographical Magazine* and *Résultats des Campagnes Scientifiques*, par Albert I., Prince de Monaco, vol. xl, xli, and xlv. Two modern works giving recent history and economic developments are *Spitsbergen: its exploration, hunting and mineral riches*, by R. N. Rudmose Brown (1900), and *Spitsbergen: Natur og Historie*, by G. Holmsen (1911). "Fra Ishavet" by G. Isachsen in *Det Norske Geografiske Selskabs Aarbok* (1916-19) gives much information about Norwegian hunters. *The Dutch Discovery and Mapping of Spitsbergen 1560-1829*, by F. C. Wieder (Amsterdam, 1919), has many reproductions of early maps. The meteorological observations at Green Harbour are published annually in *Jahrbuch des Norwegischen Meteorologischen Instituts* (Christiania). *Mit Zeppelin nach Spitsbergen*, by A. Miethe and H. Hergesell (Berlin 1911), is noteworthy for the excellence of its illustrations, including colour plates. Some of the results of the Norwegian surveys are collected in *Expédition Isachsen au Spitsberg 1900-10. Résultats scientifiques* (Christiania 1916). The geomorphology of Spitsbergen is explained by G. de Geer, "On the physiographical evolution of Spitsbergen" in *Geog. Annaler*, I. (Stockholm 1919). (R. N. R. B.)

**SPORTS AND GAMES.**—The tendency towards "internationalism" in competitive sports and games had been rapidly growing in intensity, partly as a result of the establishment of the Olympic Games, from 1896 onwards; but it was rudely interrupted by the World War, and conditions were still unfavourable up to 1921 for more than a limited renewal. The decade from 1911 to 1921 offers no proper material, therefore, for a consistent history in this field, by way of supplement to the separate articles in the earlier volumes of this Encyclopedia; nor, indeed, in the case of most sports and games, as carried on in 1910-21, had there been more than minor changes, either in equipment, methods or rules. So far as British and American interests, however, are concerned, the chief statistics, as regards the main events in the more important sports and games, are recorded in the following sections.

**Athletics, Track and Field.**—The Olympic Games were held at Stockholm in July 1912, the highest number of points being scored by the United States, and again at Antwerp in 1920, the 7th Olympiad being projected for Paris in 1924.

While the United States won the track and field events of the 1920 Olympic games in Antwerp by a considerable margin in the point score, and set new records in the pole vault, the high jump, and the 400-metre hurdles, the Americans totalled only 9 first places, the same as the team of 24 men from Finland. The "stars" of the American team were C. W. Paddock in the 100 metres, Allan Woodring in the 200 metres, Frank Loomis in the 400-metre hurdles, Richard Landon in the high jump, Frank Foss in the pole vault, Pat Ryan in the hammer, Pat McDonald in the 56-lb. weight, and H. H. Brown, the individual winner in the 3000-metre team race, the only American to win a distance event. In swimming the Americans were supreme, with Duke Kahanamoku and Keoloha, both of Hawaii, Norman Ross, Ethelda Bleibtrey, Aileen Riggins and Charlotte Boyle. The winners at the American eastern college meetings were: 1911, Cornell; 1912, Pennsylvania; 1913, Pennsylvania; 1914, Cornell; 1915, Cornell; 1916, Cornell; 1918, Cornell; 1919, Cornell; 1920, Pennsylvania; 1921, California. Princeton won against Oxford (July 8 1920) at Queen's Club, London, by 6 events to 4. At the Pennsylvania Relay Games (April 30-May 1 1920) the Oxford-Cambridge 2-m. team, Tatham, Stallard, Milligan and Rudd, set a new world's record of 7 min. 50  $\frac{1}{2}$  sec.

**Cricket.**—Before the war English cricket was in a flourishing condition. The visit of a South African team to Australia in 1910-1, in which the South Africans did hardly as well as had been expected, served as a prelude to the so-called Triangular Tournament of 1912; and in the meantime an English team under the management of the Marylebone Cricket Club carried through a successful tour in 1911-2. Of 18 eleven-a-side matches the M.C.C. team lost only the first test match; four were drawn, and 18, including four test matches, were won by the Englishmen. At the end of 1910 a team sent to South Africa by the M.C.C. won two and lost three test matches. In 1912 the interest in county cricket was largely eclipsed by the Triangular Tournament between England, Australia and South Africa, in which nine test matches were played. England proved victorious, winning four matches (three against South Africa and one against Australia) and drawing twice with Australia, owing to bad weather. The Australians beat the South Africans twice. Of the 102 matches played up to 1920 between England and Australia, England won 46 and Australia 35. Of those played in England the home team won 17 and Australia 8, and 17 were drawn. In those played in Australia England won 30 and Australia 27, three being drawn. In 1921, however, in their visit to England, the Australians won an easy victory.

A new method of deciding the English county championship was inaugurated in 1911. With the idea of discouraging the players from aiming at drawn matches, five points were given for a win, and three points (with one point to the losing side) for a first-innings victory. The championship was won by Warwickshire in 1911, by Yorkshire in 1912 and by Kent in 1913. In 1914 the championship was not decided owing to the outbreak of war, but the M.C.C. Committee adjudged Surrey the winners. It was resumed in 1919, when a new system was adopted, by which only wins counted, the winners being the county with the highest proportion of wins to matches played. Yorkshire was at the head of the list in 1919, and Middlesex in 1920 and 1921.

The Oxford and Cambridge match was not played between 1915 and 1918. In 1911, 1914 and 1919 Oxford won, and in 1912, 1913 and 1921 Cambridge were the winners, the match in 1920 being drawn. From 1911 to 1921, with the exception of the years 1915 to 1918, when the match was not played, Eton won against Harrow.

**English Football.**—(1) Rugby.—In 1911 a French team for the first time was victorious in an international match, beating Scotland in Paris. In the same season Wales beat England, Ireland, Scotland and France; Ireland beat England, Scotland and France; England at Twickenham beat Scotland and France. In 1912 all the international matches that took place in the United Kingdom were won by the fifteen playing in its own country. England defeated Wales and Ireland, but narrowly lost to Scotland. Ireland beat Scotland and Wales, and Wales beat Scotland. In no match was France victorious. A strong South African team began a tour in Great Britain in the autumn of 1912. After gaining several decisive victories over counties, the South Africans lost to Newport, were with great difficulty victorious over Llanelli, the United Services and London, beat Oxford and Cambridge Universities, were narrowly beaten at Twickenham by another London fifteen, and easily beat Scotland at Edinburgh. They next gained their most decisive victory at Dublin, securing 36 points against Ireland, and beat Wales by a try at Cardiff, but lost to Swansea by the same margin. In the international matches in 1913 England defeated Scotland, Wales, Ireland and France; Wales beat Scotland, Ireland and France; Scotland beat Ireland and France; and Ireland beat France. In 1914 England beat Scotland, Wales, Ireland and France; Wales beat Scotland, Ireland and France; and Ireland beat Scotland and France. From 1915 to 1919 the matches were not played. In 1920 England beat Scotland, Ireland and France; Wales beat England, Ireland and France; Scotland beat Wales, Ireland and France; and France beat

Ireland. The University match went in favour of Oxford in 1910, 1911, and 1913. Cambridge won in 1912, 1914, 1915 and 1920. (2) Association.—In 1910 a tour was undertaken in Brazil by the Corinthian Football Club, and another in North America in 1911-2. From 1907 to 1914 amateur international football was affected by a dissension among English clubs. In consequence of the Football Association insisting upon the admission of professional clubs (so-called) to the district associations, a large number of amateur clubs, including the University, College and Public Schools Club, seceded to form the Amateur Football Association. The officers of the army, while sympathizing with the seceders, considered it advisable for the sake of regimental football to retain their connexion with the Football Association. But in 1912-3 they used their influence to promote a reconciliation. A conference was held at which the delegates of the two associations only failed to arrive at an agreement because the older body would not accept an arrangement by which the younger could receive the adherence of newly formed amateur clubs. In 1914, however, the Football Association and the Amateur Football Association sank their differences. The Amateur eleven of the Football Association won matches with Wales, Belgium, France and Holland in 1910-1, but lost to Ireland. In 1911-2, besides victories at the Olympic Games, they defeated Ireland, Wales, Denmark, Holland and Belgium. The Amateur Football Association teams beat Wales and France in both seasons. The full representative eleven of the Football Association defeated Ireland and Wales in 1911 and drew with Scotland. Ireland lost to Wales and Scotland, and Scotland drew with Wales. In 1912 England and Scotland again played an indecisive match, but both beat Wales and Ireland; Wales lost three matches. In 1913 England beat Scotland and Wales; Wales beat Ireland and drew with Scotland; Scotland beat Ireland; and Ireland beat England. In 1914 England beat Wales; Scotland beat England; Ireland beat England and Wales and drew with Scotland; and Wales drew with Scotland. In 1920 England beat Scotland and Ireland; Wales beat England and drew with Ireland and Scotland; and Scotland beat Ireland. The Football Association Cup was won in 1911 by Bradford City, in 1912 by Barnsley, in 1913 by Aston Villa, in 1914 by Burnley, in 1915 by Sheffield United, and in 1920 by Aston Villa. The championship of the Football League was carried off by Manchester United in 1911, by Blackburn Rovers in 1912, by Sunderland in 1913, by Blackburn Rovers in 1914, by Everton in 1915, and by West Bromwich Albion in 1920. The principal trophy of the Amateur Football Association was won in 1911 by the Old Malvernians, in 1912 by Oxford City, in 1913 by the New Crusaders, in 1914 by Ealing, and in 1920 by Dulwich Hamlet. The Arthur Dunn cup for public school clubs fell to the Old Reptonians in 1911, to the Old Malvernians in 1912, to the Old Brightonians in 1913, to the Old Reptonians in 1914, to the Old Wykehamists in 1920, and to the Old Carthusians in 1921. Oxford won the University match in 1911 and Cambridge won in 1912, 1913, 1915; in 1914 and 1920 the match was drawn.

**American Football.**—Of all amateur sports in America, college football (the American Rugby game) drew the largest crowds and aroused the greatest enthusiasm. Occasional professional teams drew big gate receipts, especially in Ohio and Michigan, where the professional game was popular, but in general it was not encouraged. After 1908 a number of colleges abandoned football because of the deaths and injuries that resulted from the old-style mass playing. In the following years, especially in 1910 and 1912, radical revisions of the old rules were made; the new rules were designed to foster a more open style of play and to make the game more interesting to spectators. The periods of play, formerly two halves of 35 min. each, were altered to four periods of 15 min. each, with an intermission of one minute between the first and second, and third and fourth periods, and 15 min. between the second and third periods. The playing field, from goal line to goal line, was shortened from 110 to 100 yd. and each side was given four trials in which to make the required 10 yd. The removal of the restrictions on the forward pass was one of the most conspicuous changes; this with other new rules, had the effect of encouraging an open, running game, in which the advantage lay rather in quick thinking and skillful playing than in mere weight or strength. The full possibilities of the new rules were not realized for some time, but, as familiarity with them increased, the play became more spectacular, and there was no question that the game had been improved from the standpoint of both spectator and player. Ordinarily the schedule of football games was not designed to determine the champion team among eastern colleges; therefore in reviewing the football games of the decade 1910-20 the choice of the strongest teams is to some extent a matter of opinion. From 1910 to 1915, inclusive, Harvard University had a succession of strong teams, which in nearly every year gained what appeared to be a clear title to the championship. The succession was interrupted in 1911, however, when Princeton defeated both Harvard and Yale. In the next year the honours went to the smaller colleges—especially the university of Pittsburgh and Colgate University—and this was interpreted as due in part to the fact that the new rules had removed certain handicaps from the less powerful teams. Football probably had never been so popular as in 1916; it was estimated that in that year 35,000 games were played throughout the United States, with an attendance of 6,500,000. Owing to the entrance of the United States into the war, the

major teams practically cancelled their schedules during the two following years, but in the army and navy every unit had its team. A full schedule was played by the A.E.F., the winners being the 89th Div. team, captained and coached by Captain Gerhardt of West Point. The resumption of college games in the east in 1919 showed that college football had lost none of its popularity. One of the strongest teams of 1919 was that of Pennsylvania State College, though Harvard went through the season without experiencing defeat. Despite a tie with Harvard, Princeton was generally conceded to have had the best team turned out in the east in 1920, the first really normal year of play after the war. The tendency among colleges was more and more towards open play, with much kicking and forward passing. The east, however, continued to play a far more conservative game than was popular in the west and south. Among the colleges of the middle west the strongest teams were Michigan (1910), Minnesota and Michigan (1911), Wisconsin (1912), Chicago (1913), Illinois (1914), Illinois and Minnesota (1915), Ohio State (1916-7), Illinois (1918-9), Ohio State (1920). Ohio State, champions of the middle-west group in 1920, played an intercollegiate match at Pasadena at the Festival of Roses in that year with the university of California, and was badly defeated. The large attendance at football matches led to the construction of immense stadiums of concrete and steel to accommodate the crowds. Two of these stadiums, those at Harvard and at Syracuse University, had been constructed before 1910; after that year there were built a number of others, among which the most noteworthy were, perhaps, those at the university of Chicago, Yale (the "Yale Bowl"), the university of Michigan, Princeton (the Palmer Memorial stadium), the university of Pennsylvania and the college of the City of New York. The greatest of these structures, the Yale Bowl, has exterior dimensions of 940 by 744 ft. and a permanent seating capacity of 61,000. This huge amphitheatre cost more than \$500,000 and is considerably larger than the Roman Colosseum, which had a seating capacity of about 45,000. The Palmer stadium at Princeton provides seats for 41,000 and cost \$350,000.

The Association game made remarkable gains in popularity not only among American colleges and the country clubs, but among the big industries as well. Each year the United States Football Assn. conducted a national cup competition, the final round of which was won in 1920 by the Ben Miller Athletic Club of St. Louis from the Fall River Club of Quincy, Mass. Previous winners include the Bethlehem Steel Co., the Fall River Rovers, and the Brooklyn Field Club.

Baseball, the universal American sport, occupied the attention of the public in the United States chiefly as a professional game in which the leading cities were represented by baseball teams comprising two major leagues—the American and the National. At the end of each year the winning teams of the two leagues played what was known as the world series for the championship. During 1910-20 these contests were by far the most popular of all annual sporting events. This is indicated by the attendance and gate receipts, which in 1920 were 174,414 and \$564,800, respectively, and in 1919, 236,928 and \$722,414, as against an attendance of 125,222 and receipts of \$173,980 in 1910. In the following list of world-series contests since 1910, the name of the winning team is given first, that of the losing team second, and the score in games three: 1910, Philadelphia (American League) vs. Chicago (National League), 4-1; 1911, Philadelphia (A.L.) vs. New York (N.L.), 4-2; 1912, Boston (A.L.) vs. New York (N.L.), 4-3, one game tied; 1913, Philadelphia (A.L.) vs. New York (N.L.), 4-1; 1914, Boston (N.L.) vs. Philadelphia (A.L.), 4-0; 1915, Boston (A.L.) vs. Philadelphia (N.L.), 4-1; 1916, Boston (A.L.) vs. Brooklyn (N.L.), 4-1; 1917, Chicago (A.L.) vs. New York (N.L.), 4-2; 1918, Boston (A.L.) vs. Chicago (N.L.), 4-2; 1919 Cincinnati (N.L.) vs. Chicago (A.L.), 5-3; 1920, Cleveland (A.L.) vs. Brooklyn (N.L.), 5-2. In 1914 an attempt was made to organize a third major league, known as the Federal, but this was unsuccessful, and at the end of the following season it was amalgamated with the two older leagues. After 1919 baseball was for a time under a cloud, owing to charges that certain members of the Chicago American League team had been bribed by outside persons to lose the 1919 world series. The accused players were expelled from organized baseball, and there was a general overhauling, with the result that final authority over the game was given to Kenesaw Mountain Landis, a Federal judge known for his proficiency in the law and his knowledge of baseball. During the World War American soldiers carried the game to England and France, where it was a favorite diversion in the camps of Canadian and U.S. soldiers. The professional game enjoyed an extraordinary revival after the war, the crowds breaking all records, especially since Sunday playing was more generally permitted by law than before. Colleges generally resumed the game, though interest in college baseball was slight in comparison with interest in college football.

Lawn Tennis.—American players, during 1910-21, were in the forefront, but an increasingly high standard of play was being shown among other nationalities besides the British and American, notably the French and Japanese. The International Davis Cup was won by Australia in 1911 and 1914, by the British Isles in 1912, and by the United States in 1913 and 1920. In 1911 the United States team (Larned, McLoughlin, Little and Bundy), were beaten by

Australia (Brookes, Dunlop and Heath) after beating Great Britain (Dixon, Lowe and Beamish). In 1912 Great Britain (Dixon, Parke and Beamish) defeated Australia (Brookes, Heath and Dunlop). In 1913 the United States (Hackett, McLoughlin, Little and Williams) beat Great Britain (Parke, Dixon, and Roper-Barrett). In 1914 Australia (Brookes, Wilding, Dunlop and Doust) beat the United States (McLoughlin, Williams, Behr and Bundy); McLoughlin defeated Brookes in a memorable match (14-16, 6-3, 6-3), and Wilding by 6-2, 6-3, 2-6 and 6-2, but McLoughlin and Bundy lost the doubles to Brookes and Wilding. In 1920 the United States (Hardy, Johnston, Tilden, Williams and Garland) defeated Great Britain, France and Australia.

In the English singles (world's) championships A. F. Wilding won in 1911, 1912 and 1913; N. E. Brookes in 1914; G. L. Patterson in 1919; and W. T. Tilden in 1920 and 1921. Mrs. Lambert Chambers won the English ladies' singles in 1911, 1913 and 1914; Mrs. Larcombe in 1912; and Mlle. S. Lenglen in 1919, 1920 and 1921. In the English covered court championship A. H. Gobert won the singles in 1911, 1912, 1920 and 1921; Gobert and M. J. G. Ritchie won the doubles in 1911, Wilding and S. N. Doust won the doubles in 1912 and 1913. F. M. Davson won the English singles in 1913 and 1919. In 1914 Ritchie won the English singles and in 1914 and 1921 T. M. Mayrorgardate and Davson won the doubles. In 1919 the English doubles were won by R. Lycett and R. W. Heath, and in 1920 by Gobert and Lycett.

In the United States, William A. Larned won the championship for the seventh time in 1911, his experience proving too much for the challenger, Maurice F. McLoughlin; the doubles went to Raymond D. Little and Gustave Touchard, while Miss Hazel Hotchkiss won the women's title for the third time. In 1912 McLoughlin won the American championship, Larned not being in the tournament; McLoughlin and Thomas Bundy won the doubles from Little and Touchard, and Mary Browne won the women's championship. The outbreak of war in 1914 robbed the Newport tournament of interest. The German team was interned in England on the way home, Meantime Williams won the national title, and McLoughlin and Bundy the doubles. In 1915 much attention was paid to building up the junior tournaments. There was no international competition. William M. Johnston, of California won the championship. With Clarence J. Griffin, another Californian, he also won the doubles. Miss Molla Bjurstedt (later Mrs. Mallory), won the women's championship. In 1916 the United States was the world's lawn-tennis centre. The season was marked by the appearance of two Japanese players, Kumagae and Mikami, in the principal tournaments, Williams won the national singles title, Johnston and Griffin the doubles. Miss Bjurstedt took every title she contested. In 1917, with the United States in the war, tennis was transferred to the army and navy, all the ranking 10 players being in the services. The "patriotic" singles in lieu of a national championship, was won by R. L. Murray, a Californian settled in the east. In 1918 R. L. Murray won the title in straight sets from William T. Tilden. Tilden and Vincent Richards won the doubles title. In 1919 Johnston won the singles title from Tilden, while Brookes and Gerald Patterson, from Australia, took the doubles. Brookes, Patterson, Lycett and Thomas, of Australia, invaded the United States, but were beaten at Forest Hills, 4 matches to 0, by Johnston and Williams, and in the doubles by Tilden and Johnston. In 1920 Tilden won back the singles titles from Johnston, while Johnston and Griffin won the doubles.

Polo.—The United States retained the cup against England at Meadowbrook in 1911, winning by 2 to 0, the American team consisting of the famous "big four," Lawrence Waterbury and J. M. Waterbury (forwards), Harry Payne Whitney (No. 3), and Devereux Milburn (back); in 1913 the same team won again by 2 matches to 0. In 1914 Lord Wimborne's team took the trophy to Great Britain winning 2 straight matches from an American team consisting of Milburn, who played both 3 and back, the two Waterburys, and Rene La Montagne. In 1921 an American invasion of Hurlingham was led by Devereux Milburn, whose team, consisting of himself at back, J. Watson Webb at No. 3, Thomas Hitchcock, Jr., at No. 2, and Louis E. Stoddard at No. 1, brought the cup back to the United States winning 2 straight matches by 11 to 4 and 10 to 6.

Yachting.—Just before the outbreak of the war Sir Thomas Lipton renewed his challenge for the America's Cup, there having been no races since 1903. "Shamrock IV," a much-criticized boat, was sent to a drydock in Brooklyn, while "Resolute" and "Vanitie" reappeared and contested the right to sail as defender. The thirteenth series of races for this trophy was not sailed until July 15-27 1920, off Sandy Hook. The challenger was designed by C. E. Nicholson and was sailed by Capt. William F. Burton, an amateur skipper. Capt. Andrew Jackson Alpegate, an American familiar with conditions on this course, acted as professional pilot. The defender was "Resolute," winner of 7 out of 13 races against "Vanitie," 4 being won by the latter and 2 called off. "Resolute" was built by a syndicate of New York yachtsmen, composed of J. P. Morgan, Cornelius Vanderbilt, Arthur Curtiss James, George F. Baker and others. The skipper was the well-known amateur, Charles Francis Adams of Boston. The sailing-master was Capt. Chris Christensen, he and the mates being of Scandinavian birth, but American citizens. The defender was designed by Nat. Herres-

hoff, of the Herreshoff family of Bristol, R.I. The first 2 races were won by "Shamrock," the last 3 and the cup by "Resolute." Twice the yachts failed to finish within the 6-hour time limit. Once the wind was deemed too strong to permit a start. It was feared that with lee decks awash there was risk of losing a man overboard. In all but one race "Resolute" was allowed 6 min. 40 sec. handicap, due largely to the challenger's great sail area with Marconi mast and extreme hoist. In the same year was held the first race for the championship of the North Atlantic fishing fleet off Halifax. "Esperanto," United States, defeated "Delawanna," Canadian, in two straight races over a 40-m. course, for \$4,000 and a cup.

**Golf.**—In Great Britain, H. Vardon was the champion in 1911 and 1914, E. Ray in 1912, J. H. Taylor in 1913, G. Duncan in 1920, and Jock Hutchison in 1921. In the amateur championships H. H. Hilton won in 1911 and 1913, John Ball in 1912, J. L. C. Jenkins in 1914, C. J. H. Tolley in 1920 and W. I. Hunter in 1921. The ladies' open championship fell to Miss D. Campbell in 1911, to Miss G. Ravenscroft in 1912, to Miss Muriel Dodd in 1913, and in 1914, 1919, 1920 and 1921 to Miss C. Leitch.

In the United States the amateur championship was won by H. Hilton in 1911 and by Jerome Travers in 1912. J. J. McDermott won the open tournament both in 1911 and 1912. Travers defeated Anderson for the amateur title in 1913, and Francis Ouimet won the open title, after a tie with Harry Vardon and Ted Ray of England. No amateur before had won this title, and Ouimet was only 20 years old. Miss Gladys Ravenscroft, of England, won the American ladies' championship in 1913. In 1914 Ouimet defeated W. C. Fownes for the amateur title, and Walter Hagen won the open from a field of English, French and Scotch professionals; the women's title went to Miss Georgiana Bishop. The amateur title for 1915 went to Robert M. Gardner, and Jerome Travers won the open, the second triumph of an amateur. In 1916 "Chick" Evans took the amateur title from Gardner, and the open from the professional Jock Hutchison. With the United States at war in the following year golf was abandoned save as exhibitions were given in aid of the Red Cross. The first revival came in 1918 with a match in Canada between American and Canadian amateurs, which was won by the Canadians, 23 to 19. A complete revival followed in 1919; S. Davisson-Herron won the amateur title, though four former champions, Travers, Gardner, Ouimet and Evans, were entered. "Bobby" Jones was the runner-up. The open was won by Walter Hagen, while Miss Alexa Stirling easily took the women's title. Gardner went to England in 1920 for the amateur championship, and was only beaten in the final, after an extra hole, by Cyril J. Tolley, the Oxonian. Ray and Vardon made this year a remarkable invasion of the United States, Ted Ray winning the open championship. The amateur title went to Evans. The U.S. team easily won the Devonshire Cup from Canada. In 1921 an American invasion of England by the strongest of professional and amateur teams resulted in the winning of a team match by the Americans, and of the open championship by Jock Hutchison, of St. Andrews, a naturalized American.

**Horse Racing.**—The following is a list of the winners of the Derby in England from 1911 to 1921:—

Winner	Owner	Trainer	Jockey
1911 Sunstar	Mr. J. B. Joel	C. Morton	G. Stern
1912 Tagalie	Mr. Raphael	D. Waugh	J. Reiff
1913 Aboyeur	Mr. Cunliffe	Lewis	Piper
1914 Durbar II.	Mr. H. B. Duryea	(trained in France)	MacGee
1915 Pommern	Mr. S. B. Joel	C. Peck	S. Donoghue
1916 Fifiella	Mr. E. Hulton	R. C. Dawson	J. Childs
1917 Gay			
Crusader	Mr. Fairie	A. Taylor	S. Donoghue
1918 Gainsborough	Lady James Douglas	A. Taylor	J. Childs
1919 Grand			
Parade	Lord Glanely	Barling	F. Templeman
1920 Spion Kop	Major G. Loder	Gilpin	F. O'Neill
1921 Humorist	Mr. J. B. Joel	Morton	Donoghue

<sup>1</sup> Craganour, who came in first, was disqualified.  
<sup>2</sup> "New Derby" run at Newmarket.

Other "classic" races resulted as follows:—

	Doncaster	2,000-guineas	1,000-guineas
	Oaks	St. Leger	Newmarket
1911 Cherimoya	Prince Palatine	Sunstar	Atmah
1912 Mirska	Tracery	Sweeper II.	Tagalie
1913 Jest	Night Hawk	Louvois	Jest
1914 Princess	Black Jester	Kennymore	Princess
	Dorrie		Dorrie
1915 Snow	Not run	Pommern	Silver Tag
	Marten		
1916 Fifiella	Not run	Clarissimus	Canyon
1917 Sunny Jane	" "	Gay Crusader	Diadem
1918 My Dear	" "	Gainsborough	Ferry
1919 Bayuda	Keysoe	The Panther	Roseway
1920 Charlebelie	Caligula	Tetratema	Cinna
1921 Love in Idleness		Craig an Eran	Bettina

<sup>1</sup> Run at Newmarket.

In 1914, before the season was half over, came the war. During most of August racing was suspended, partly because of difficulties of transit and also because some courses were occupied by the military. Owing largely to the King's desire that the interests of many people employed in racing establishments should not be endangered, the remaining fixtures were carried out, so far as regarded the more important ones. For the first time since 1865 the Derby was won by a horse bred and trained in France, Durbar II. On May 16 1915 the Jockey Club issued a notice suspending all racing under their jurisdiction, except the Newmarket fixtures, until further notice. Substitute races for the Derby, Oaks and St. Leger were arranged at Newmarket.

In the United States, too, horse-racing was interrupted by the war, but there was a prompt revival afterwards. In 1920 Man-O-War, a chestnut colt by Fair Play-Mahubah, from the Glen Riddle Farm, and trained by Louis Feustel, started in 21 races, winning 20 and taking one second. Its total winnings amounted to \$244,465. Man-O-War held the American running records for 1 m. (1 min. 35 3/4 sec.), 1 1/4 m., 1 1/2 m. and 1 3/4 m. The climax of the 1920 season was a match race between Man-O-War, owned by Samuel Riddle, and Sir Barton, owned by Commodore Ross of Canada, at a mile and a quarter, at the Kenilworth track, Windsor, Ont. The race was for a purse of \$75,000 and a \$5,000 cup offered by A. M. Orpen. Man-O-War won by seven lengths in 2 min., 3 sec., three seconds slower than the record made by Whisk Broom II. in 1913.

**Rowing.**—For the professional championship of the world, the following contests took place:—

1910—R. Arnst beat E. Barry on Zambesi.
1911—R. Arnst beat H. Pearce on Parramatta.
1912—E. Barry beat R. Arnst on Thames.
1912—E. Barry beat E. Durnan on Thames.
1913—E. Barry beat H. Pearce on Thames.
1914—E. Barry beat J. Paddon on Thames.
1919—A. D. Felton beat E. Barry on Thames.
1920—E. Barry beat A. D. Felton on Parramatta.

In England the winners in the Oxford and Cambridge boat races for 1911–21 were:—

1911.....Oxford	1915-9.....Not rowed
1912.....Oxford	1920.....Cambridge
1913.....Oxford	1921.....Cambridge
1914.....Cambridge	

In the 1912 races, as originally rowed, both boats became waterlogged and Cambridge sank. But the race was rowed again the following Monday, Oxford winning.

**American rowing**, interrupted by the war, was promptly revived, and assumed an international character when in 1920 the veteran crew of the U.S. Naval Academy at Annapolis defeated a picked English eight over the canal course at Brussels for the Olympic championship. In 1921 the Annapolis crew, with two new men in the boat, was defeated by Princeton University in a race on Carnegie Lake, over a course of a mile and three-quarters. The same Annapolis crew in the same year won the revival of the Poughkeepsie Regatta over three miles, easily defeating California, Cornell, Pennsylvania, Syracuse and Columbia, the last named up to that time an unbeaten combination. Yale defeated Harvard in 1921, on the Thames river at New London, Conn., at four miles, using English rigging and boat, and being coached in the last two weeks by James Corderry, an English sculler, who had succeeded Guy Nickalls at the eleventh hour as coach at New Haven. In 1920 Harvard beat Yale, but the previous year Yale won under the coaching of Prof. Mather Abbott, an Englishman who had taught rowing for many years at St. Paul's School, Concord. Syracuse in 1916 won the Poughkeepsie Regatta under the coaching of James A. Ten Eyck. In 1920 Charles E. Courtney, Cornell's rowing coach, the foremost of American coaches, died. The winners of the American intercollegiate regatta after 1909 were Cornell (1910, 1911 and 1912), Syracuse (1913), Columbia (1914), Cornell (1915), Syracuse (1916 and 1920), Annapolis (1921). The Yale-Harvard races were won as follows: Harvard (1910, 1911, 1912, 1913), Yale (1914 and 1915), Harvard (1916), Yale (1919), Harvard (1920), Yale (1921).

**Boxing.**—The official maximum boxing weights (Great Britain and the United States) are as follows:—Flyweight, 8 st. (112 lb.); Bantamweight, 8 st. 6 lb. (118 lb.); Featherweight, 9 st. (126 lb.); Lightweight, 9 st. 6 lb. (132 lb.); Welterweight, 10 st. 7 lb. (147 lb.); Middleweight, 11 st. 6 lb. (160 lb.); Light-Heavyweight, 12 st. 7 lb. (175 lb.); Heavyweight, no maximum.

In 1920 the official list of the world's champions was:—Flyweight, Jimmy Wilde (Gt. Britain); Bantamweight, Peter Hermann (U.S.A.); Featherweight, Johnny Kilbane (U.S.A.); Lightweight, Benny Leonard (U.S.A.); Welterweight, Jack Britton (U.S.A.); Middle, Mike O'Dowd (U.S.A.); Heavy, Jack Dempsey (U.S.A.).

The results of the Amateur Boxing Association Championships in England were as follows in 1911-4:—

	Bantamweight	Featherweight	Lightweight
1911	W. W. Allen	H. Bayers	A. Spenceley
1912	W. W. Allen	G. R. Baker	R. Marriott
1913	A. Wye	G. R. Baker	F. Grace
1914	W. W. Allen	G. R. Baker	R. Marriott

Middleweight	Heavyweight
1911 W. Child	W. Hazell
1912 E. V. Chandler	R. Smith
1913 W. Bradley	R. Smith
	(walked over)
1914 H. Brown	E. V. Chandler

In professional contests the bantamweight championship of England was won by Digger Stanley against Alec Lafferty in 1912, by B. Beynon in 1913 (vs. Digger Stanley) and by Curly Walker in 1914 (vs. C. Ledoux). Fred Welsh was the lightweight champion of England in 1912 (vs. Matt Wells), 1913 (vs. H. Mehegan) and 1914 (vs. W. Ritchie). Johnny Summers was the welterweight champion of England in 1912 (vs. Arthur Evernden) and 1913 (vs. S. Burns). Jack Harrison was the middleweight champion of England in 1912 (vs. Private McEnroy). In 1913 (vs. Packer Mahoney) and 1914 (vs. Colin Bell) Bombardier Wells was the heavyweight champion of England, and in 1913 (vs. Alec Lambert) Kid Lewis was the featherweight champion of England. In 1912 Jim Driscoll (Cardiff) won the featherweight championship of the world against Jean Poesy (France); Jack Johnson (America) (heavyweight champion of the world) beat Jim Flynn (America); Georges Carpentier (France) beat Jim Sullivan (England); Frank Klaus (America) beat Carpentier; Billy Papke (America) beat Carpentier.

In 1913, in the middleweight championship of the world, F. Klaus beat Billy Papke; in lightweight championship of the world F. Welsh beat H. Mehegan; in featherweight championship of the world, J. Driscoll and Owen Moran drew; and in heavyweight championship of Europe, Carpentier beat Bombardier Wells.

In 1914, in lightweight championship of the world, F. Welsh beat W. Ritchie; and in heavyweight championship of Europe, Carpentier beat Gunboat Smith.

In 1915, at Havana, Jess Willard defeated Jack Johnson in the 25th round for the world's championship.

In 1919, at Toledo, U.S.A., Jack Dempsey beat Jess Willard (holder) for the world's championship in the 3rd round.

On Dec. 4 1919, at the Holborn Stadium, London, Carpentier beat Joe Beckett in a fight for the heavyweight championship of Europe. Beckett was knocked out in the first round after the fight had lasted one minute fourteen seconds. In 1921 Carpentier was beaten at Jersey City, U.S.A., by Dempsey, in the 4th round, in a contest for the heavyweight championship of the world, the greatest interest having been excited by this fight.

**Swimming.**—American swimmers in 1920 held a majority of the world's records. A large number of these records were held by three men—Duke Kahanamoku of Hawaii, Perry McGilvray of Chicago and Norman Ross of San Francisco. Kahanamoku won the 100-metre race at the Olympic games of 1920, establishing a new world's record of 1 min. 2½ sec. Ross was winner in two events (400 metres and 1,500 metres); Warren Kealoha of Honolulu was victorious in the 100-metre backstroke race, and the American team carried off the honours in the 800-metre relay. Two races were lost to Swedish swimmers. American women also proved themselves good swimmers, one of their triumphs was the defeat in 1919 of two Australians, Miss Fanny Durack and Miss Wylie, who visited the United States in that year. The victorious Americans were Miss Ethelda Bleibrey and Miss Charlotte Boyle, both of Brooklyn. Miss Bleibrey won a number of races at the Olympic games in 1920, where she established a record of 4 min. 34 sec. for 300 metres open water.

**English Billiards.**—Since the prohibition of consecutive spot hazards and the push stroke, English professionals have relied chiefly upon the top-of-the-table game. An innovation, however, was introduced in 1911 by the Australian, George Gray, who repeatedly made huge breaks by means of a series of losing hazards from the red ball. In all, he scored 24 breaks of four figures, of which the highest was 2,196. Gray invariably declined to play matches with ivory balls, and these breaks were not made under Billiard Association rules. H. W. Stevenson, though not at his best in 1911, beat M. Inman twice for the championship of the Billiards Control Club. In Jan. 1911 George Gray met Stevenson and defeated him in two games out of three of 18,000 up. M. Inman beat T. Reece for the Billiard Control championship in 1912, 1913 and 1914. In 1919 Inman beat Stevenson in the Billiard Association championship by 6,532 points in 16,000. In 1920 W. Smith beat C. Falkner in the Billiard Association championship by 1,500 points in 16,000. In 1921 Newman beat Reece in the professional championship by 5,256 points in 16,000.

In 1911 H. A. O. Lonsdale did not defend his title of amateur champion, and the cup reverted to H. C. Virr. An alteration was made in the arrangements, the champions of England, Ireland, Scotland and Wales meeting in competition in the finals. Virr beat Major Fleming by only seven points in 3,000 for the amateur championship in 1912. The influence of Gray's example was plainly perceptible in this competition in the use made of the losing hazard. In 1913 Virr beat J. Nugent by 1,041 points in 3,000 and in 1914 by 1,962 in 3,000. In 1914 the Scottish championship was won by A. Croneen, and the Welsh championship by A. Paton. In 1915 the Welsh champion was A. Cable. In 1915 the United Kingdom Amateur Championship was won by A. W. T. Good (England) by 3,000 points to 2,716. In 1918 it was won by Graham Symes

by 2,000 points to 1,721. In 1919 S. H. Fry won the Amateur championship by 2,000 points to 1,729, but in the Billiard Control Club's Amateur Championship Tournament was beaten by Major Fleming by 2,000 points to 1,903. In 1920 Fry again won the Amateur Championship, by 3,000 points to 2,488.

A break of 1,016 was made by Stevenson in 1912 against W. Cook, without a series of spot strokes, anchor cannons or long successions of losing hazards. Stevenson made a break of 919 in 1913, and in the same year M. Inman made one of 894. In 1903 the amateur S. H. Fry made a break of 236.

**Archery.**—The opportunity may be taken here to correct the earlier article on ARCHERY in some particulars. The bow now used by men is from 6 ft. 1 in. to 6 ft. 4 in. in length; a lady's bow ranges from 5 ft. 6 in. to 5 ft. 8 in., measured between the nocks; these lengths according to the one case with an arrow of 27 in. to 28 in. and in the other with an arrow of 25 in. to 26 in. Exceptionally long arms may render necessary an arrow an inch longer and a corresponding addition of one or two inches to the bow. The "weight" of a bow is the number of pounds required, when appended to the string, to draw to the head an arrow of 28 in. for a man's bow or 25 in. for a lady's. The weight of men's bows varies from 36 lb. to 58 lb., of ladies' from 18 lb. to 30 lb., the lighter weights being sufficient for beginners. Bows are styled "self" or "backed" according as they are made of one wood or of two or more glued together. "Self bows," if of yew, are usually made of two pieces joined by a double fish splice at the handle: as it is difficult to find a piece of this wood (incomparably the best) of sufficient length while free from knots. If made of lance they are invariably of a single piece. "Backed bows" may be of yew, backed either with the same wood or with hickory; or alternatively of washaba or of ruby, lance, or other woods backed with hickory; the back being the flat side of the bow, and the "belly" the rounded side. Three woods are sometimes employed, a thin strip of fustic being interposed between a belly of yew and a back of hickory. There should be an inflexible centre of about 21 inches, whence the bows should taper gradually towards each end. It should be straight, the back true, and, when strung, the string should appear to cut the belly into two equal parts. Self yew bows are the best. They are light in the hand, the sweetest to pull, and have the best cast; but they require careful handling. They are also expensive, costing from £5 to £15, and they are liable to "crystals," or tiny cracks, which gradually spread until the bow breaks. A yew backed yew, which is next in merit, can be bought for £5 and is somewhat less liable to crystals. Between the others there is little to choose, provided that they are properly made, and not "reflexed," as they are said to be when the ends bend outward; for these jar the hand. Their price varies from 25s. to 3 guineas. The string for a man's bow should be from 6 in. to 6½ in. from the back of the bow when strung; for a lady's from 5½ in. to 6 in., according to the length of the bow. The nock of arrows—it is never called the "notch"—should not be "cut square" but rounded. The feathers must be wing and not body feathers, which are quite useless. They should be from the same wing, i.e. right or left, about 1½ in. long and tapering to the front from a depth of ½ in. at the nock. If balloon-shaped, their greatest depth should be at one-third of their length from the nock-end.

With regard to target scoring and handicapping it should be noted that a St. George's Round has never been shot at a public meeting, or, indeed, at any meeting held within the last 60 years. Handicapping by the loss of rings has been obsolete for more than 35 years, nor is there any system which can rightly be called handicapping by points. Handicapping is now carried out either by dividing the archers into classes according to their powers, or by deducting percentages from their scores for previous successes.

As regards the history of archery, some corrections may also be made. The bow was used in war at a later date than 1860, viz. by the Japanese against the English at Surin Nosake, September 5 1864. Nor did the Armada year see the last appearance of the English archer. A company of archers was raised for the expedition to the island of Rhé in 1627. There were archers among the Russian troops in the Crimea. Again, the relation of Finsbury Archers, the Hon. Artillery Company and the Royal Toxophilite Society requires restatement. In July 1676, William Wood, Marshal of the Finsbury Archers, was sent round with a paper, signed by Sir E. Hungerford and others, setting forth that the "officers and others of the Society of Archers, within the cities of London and Westminster" have determined "that the bearer shall have a silver badge and bear the same as Marshall to the Queen's Majesty's Regiment of Archers." The names of the subscribers were appended (Guildhall MSS. 193). Consequently this badge or shield had no connexion with Oxford. The Finsbury Archers became extinct about 1761, but the Royal Toxophilite Society was not founded until 1781, when Mr. P. Constable, the last captain of the Finsbury Archers, joined it and handed to it the shield and other valuables. There was, therefore, no combination of the two clubs in 1841. It is incorrect to assert that the Finsbury Archers were not connected with the Hon. Artillery Company. They were connected, and under their powers shot over the Finsbury Fields up to 1657. The Archers' Division of the Hon. Artillery Company was formed by members of the Royal Toxophilite Society in 1784. (X.)

**SPRING-RICE, SIR CECIL ARTHUR** (1859-1918), English diplomatist, was born in London Feb. 27 1859, the second son of the Hon. Charles Spring-Rice (1819-1870), sometime assistant under-secretary for foreign affairs, and grandson of the 1st Baron Montagu. He was educated at Eton and Balliol College, Oxford, and entered the Foreign Office in 1882, becoming private secretary to Lord Granville in 1884 and précis writer to Lord Rosebery in 1885. He went to Washington as third secretary in 1886, and after various brief appointments went in 1895 to Berlin. In 1898 he became secretary at Teheran, and from there went in 1901 to Cairo as British commissioner on the Caisse de la Dette. In 1903 he went to St. Petersburg, first as secretary and later as councillor of embassy, remaining in Russia during the war with Japan of 1904-5 and the revolution of 1905. In 1906 he was sent to Persia as minister, having lately been created K.C.M.G., and his stay there coincided with the period of the delicate negotiations which preceded the signing of the Anglo-Russian agreement of 1907. In 1908 he was created G.C.V.O. and went to Sweden as minister, and in 1912 was appointed ambassador to the United States. Ill-health, however, prevented his undoubtedly brilliant capacity from making his work at all prominent during his tenure of this position. He died at Ottawa on his way home to England Feb. 14 1918. He married in 1904 Florence, daughter of Sir Frank Lascelles, and left two children.

**SQUIRES, RICHARD ANDERSON** (1880- ), Newfoundland politician, was born at Harbour Grace, Newfoundland, Jan. 18 1880. He was educated at the Methodist College, St. John's, and Dalhousie University, Halifax. In 1902 he was admitted a solicitor, and in 1911 was called to the bar (K.C. 1914). In 1909 he entered the Legislature as Liberal member for the Trinity district, for which he sat until 1913. In 1914 he became Minister of Justice and Attorney-General, from 1914 to 1917 was a member of the Legislative Council, and from 1917 to 1918 Colonial Secretary. He was nominated leader of the Liberal party in Aug. 1919, and the same year became Prime Minister.

**STAFF, MILITARY** (see 25.752).—One result of the unqualified success which Prussian arms achieved in the wars of 1866 and 1870-1 was that the general staff principle, which had so largely contributed to give victory to the hosts controlled by von Moltke in those contests, was adopted by almost every military power during the last quarter of the 19th century. The exact nature of the arrangements necessarily varied in different countries, but the ideals sought after were the same. Thus in the different staff organizations as they were constituted in peace-time, work in connexion with devising plans for offensive operations and for ensuring territorial defence, duties dealing with the collection of military information, the superintendence of the education of officers, the conduct of manoeuvres and the training of troops, were kept as far as possible distinct from administration—"adjutantur," as the Germans call it. Before the year 1900 most armies possessed a general staff which was more or less in close touch with its Government on the one hand and, thanks to its ramifications, with the troops on the other.

Only two of the more important nations—the United Kingdom and the United States—adhered for all practical purposes to previously existing systems, under which preparation for war was relegated to the background in staff duties. It is true that in either state certain improvements were effected by the military authorities, tending towards ensuring that at least some of the functions properly performed by a general staff should be allocated to special branches of the staff; but, such as they were, they did not go very far. Then came the S. African War of 1899-1902. The difficulties and disappointments encountered by British military forces in that protracted struggle, coupled with the unsatisfactory working of the staff in the field (especially in its higher grades) during the progress of the operations, made plain the need of reform, and the War Office was considering the question of far-reaching modifications of the system in force when, in 1904, the Government suddenly set up a "War Office Reconstitution Committee" charged with the duty of reorganizing the central administration of the army. The committee recommended a number of drastic alterations, but by far the most im-

portant of its proposals was that a General Staff Department, which was to constitute the foremost branch of the professional side of the War Office, should be created forthwith out of certain existing sections, with entirely new sections superposed. The committee further urged that a general staff organization, acting under the aegis of, and in close touch with, the general staff in Whitehall, should be introduced into military districts and commands. The recommendations of the committee were accepted by the Government, and so it came about that a British general staff was established ten years before the outbreak of the World War. During those ten years remarkable progress was made, and when the nation was confronted by the tremendous emergency of Aug. 1914 it had at its disposition a body of well-trained general staff officers, sufficient for the comparatively small army that was available to take the field at the opening of hostilities, although totally insufficient to meet the requirements of the vast forces which had to be improvised after war had broken out. The Government of the United States was still later than that of the United Kingdom in establishing a general staff of the kind that Scharnhorst had thought of a century before. This was only set on foot in 1911, six years before the entry of the Republic into the great conflict which was to upset so many preconceived ideas on the subject of conducting war, but which was to prove—even more conclusively than had the Franco-German War and the Japanese triumphs of 1904-5—how imperative it is under modern conditions for a state which embarks upon a serious struggle with a foreign foe to have an efficient and suitably organized military staff at its command. Owing to the very small number of trained general staff officers that were available when the country became committed to hostilities on a vast scale, the U.S. forces were even worse equipped in this respect when they took the field in Europe than were those of the United Kingdom in their greatly expanded form.

The remarkable progress that has taken place in science of recent years has tended to impose some entirely new duties upon military staffs, brought about their expansion in certain directions, and even necessitated the creation of some entirely new branches as part of their organization. There is, for instance, in the first place that development in railway communications which has occurred in most civilized countries and in many possible and actual theatres of war, as also the contriving of numberless devices by which the construction of new lines of rail is facilitated during operations in the field. Then again there is the question of electric communications, which to-day play so conspicuous a part in war. Improvements in small arms and in ordnance have brought it about that the volume of ammunition needed for the weapons in the hands of troops has come to be out of all proportion to the amount which experience had proved to be ample in campaigns of the past. Developments in mechanical traction are giving this an ever-increasing military importance, not merely from the point of view of the supplying of armies but also from that of their tactical employment. The appearance of the tank on the battlefield is another feature of very recent date which tends to increase staff work. Finally, there is the establishment of air power which has introduced a factor of incalculable importance as affecting the control of belligerent armies; whether the combatant aeronautical service of a nation form part of its military organization or be independent, its operations in time of war impose duties upon military staffs such as had not to be performed by them in any contest previous to the World War. In some cases it is mainly the general staff that finds its labours increased by these modern developments, in other cases the new work falls rather upon the administrative staff. But in all cases both subdivisions of the staff are, at least to some extent, affected.

One most important duty which devolves upon the general staff in a State compelled by its geographical position and by political and international problems to maintain fighting forces both by sea and by land is the establishing and the maintenance of intimate relations with the naval authorities. Such conditions prevail in the case of most maritime nations, and, where this is so, it is imperative that the two services shall be capable of

effective coöperation in the event of war. Effective coöperation when an emergency arises can only be ensured if the military staff has been in close touch with the corresponding naval staff in time of peace. Much attention had fortunately been paid to this question in the United Kingdom during the period that intervened between the creation of the British general staff and the outbreak of the World War. Permanent contact existed between the thinking branches of the Admiralty and of the War Office. Problems which might possibly arise in the future had been examined by them in conference, principles of action had been laid down, details had been worked out, and to this is to be attributed the secrecy and the smoothness with which the British Expeditionary Force was transported across the Channel to France during the fortnight succeeding the declaration of war in 1914. Moreover, thanks to their being brought into contact at staff rides with naval officers and to the happy relations which existed between these two services, British general staff officers as a body had studied and were acquainted with naval doctrine and naval procedure, a great advantage when, as was the case at the Dardanelles, operations partook of an amphibious character. General staffs on the Continent did not, on the other hand, prove to be equally well-informed as to maritime conditions; this was made apparent during discussions such as often took place between military authorities representing the different Allies, concerning the policy which ought to be pursued in the Near East and other problems in which sea-power was necessarily involved. It is only natural, however, that a military staff which is representative of a sea-faring people should devote more attention to such subjects than will that of a non-maritime nation or of a nation possessing small maritime interests and limited maritime resources.

When a country elects to make of its air service a department of State distinct from the army, as has happened in the United Kingdom, it necessarily falls to the lot of the military general staff to maintain those intimate relations with the aerial general staff by which alone mutual coöperation can be secured in time of war. Under such circumstances the military general staff stands towards the air service as it does to the navy.

"War," said Clausewitz, "is only a continuation of State policy by other means," and elsewhere that "none of the principal plans which are required for a war can be made without an insight into the political relations." It was a recognition of this truth on the part of her Government that led to the triumphs of Prussia, first over Austria and then over France, in the days of von Moltke, the foremost professional interpreter of Clausewitz' doctrines. The executive in Berlin had during the middle decades of the 19th century been working hand in hand with the general staff. Sadova and Sedan were the outcome. The history of the short-lived German Empire indicates that in later years a tendency made itself felt for the general staff to attempt to direct, and even partially to succeed in directing, the policy of the Government. A system of genuine militarism in its worst form began to creep in, which in due course brought untold disasters on the German people; but the passages quoted above from the great Prussian military writer do not inculcate anything of that kind. What they do inculcate is that there should be at all times an intimate understanding between what has been called the "brain of the army" and the civilian executive at the head of the State. The truth is that any Government which understands its business will always, when any question of a delicate nature arises between it and the rulers of some foreign Power, keep itself fully acquainted with the resources at command for enforcing its wishes should a quarrel supervene. If, moreover, the most is to be made of such fighting force as a country will dispose of in the event of finding itself in a state of belligerency with some neighbour, it is indispensable that the military—as also naval—authorities shall have made beforehand a study of the strategical situation that will, as far as can be foreseen, arise when hostilities break out. It is also indispensable that those authorities shall have been made aware in advance of the likelihood of the struggle's taking place. It is on the central directing branch of the general staff, *i.e.* on the General Staff Department

at the War Office in the case of the United Kingdom, as it was on the "Great General Staff" of the days of von Moltke and the German Empire, that devolves the duty of maintaining relations with the Government and of advising it regarding the military aspect of problems created by the international situation. That central directing branch of the general staff is entitled to expect that the Government shall keep it fully *au courant* with the political conditions of the day.

The merits of the doctrine preached by Clausewitz seem to be self-evident, but leaders of opinion in the United Kingdom were slow to realize its importance. There existed an almost unaccountable inability to perceive the dangers to which a State unprepared for emergencies is exposed. When a Royal Commission presided over by Lord Hartington virtually recommended the setting up of a general staff in 1889, one of its members, a prominent politician who at a later date came to be Prime Minister, actually—in one of the most fatuous documents ever written by a public man—objected to the proposal on the grounds that, owing to its peculiar position, Great Britain had no need to study possibilities of conflict in advance. With such ineptitude in influential quarters, the bitter experiences of the S. African War were required to awaken British statesmen to a realization of their responsibilities. The lessons of that contest were to some extent learnt. By the setting up of the Committee of Imperial Defence, in which professional opinion was given a powerful voice, some preliminary steps had been taken in the right direction even before the creation of the general staff in 1904, and, subsequent to that date, the general staff at the War Office has been constantly consulted by the British Government and has been kept well-informed on all points of importance connected with the international situation.

How, as a matter of administration, the relations between the general staff and the executive are to be governed, and by what process communications between them are to be carried out, necessarily depends upon the political system in vogue in the state concerned. In any country possessing representative institutions the general staff can only be acting in a consultative capacity, at all events in peace-time. In the United Kingdom in the years preceding the World War the Chief of the Imperial General Staff and the Director of Military Operations were *ex-officio* members of the Committee of Imperial Defence. When strategical or administrative questions in which military force was or might be concerned were to be discussed by the committee, documents setting out the general staff view on the subject were laid before it by the general staff representatives. The decision of the committee on the points under discussion was taken and recorded, and executive action sometimes followed if it was involved by the decision. But although the more prominent members of the Government were included in it, the committee itself was merely a consultative body, and no executive action involving expenditure could follow on one of its decisions without the obtaining of at least nominal Cabinet sanction. Such recommendations were liable to be vetoed on account of the expense by the committee without reference to the Cabinet. Moreover, it did not necessarily follow that the view of the general staff would be accepted by the committee even on academical questions.

An interesting example of the working of the system is provided by the story of the Dardanelles. The expediency of an attack upon the Straits in the event of a war with Turkey was gone into by the committee as an academical question in 1906. The general staff were opposed to such a venture and the Admiralty representatives in the main agreed with them, the committee decided that the undertaking would in the event of a contest be inadvisable, and the result was that study of the subject on the part of the general staff virtually ceased. When early in the World War the project was brought up afresh by the First Lord of the Admiralty, the decision which the Committee of Imperial Defence had arrived at eight years before was ignored, and when the operations were undertaken their progress was hampered by lack of information, owing to the general staff's having acted on that decision and having to some extent abandoned research with regard to the topography, the resources and so forth of this

potential theatre of war. But experience proved that the general staff had been right.

When hostilities arise some instrument a good deal more effective than a consultative committee is needed to control conduct of the war, and, from Aug. 1914 to the date of the Armistice, the operations were, in the case of the United Kingdom, for the first two and a half years of the struggle under supreme charge of various forms of war council directly representative of the Cabinet and given a free hand by that body. They were later under supreme charge of the specially established War Cabinet. The general staff was practically always represented at the meetings of the war councils and of the War Cabinet, but purely in an advisory position without voting power. They were responsible to the council or the Cabinet for the advice they gave, but the council or the Cabinet was responsible to the country for accepting or rejecting that advice. It is true that as a result of somewhat peculiar conditions that held good in the early days of the struggle, attributable partly to the unique personality of Lord Kitchener and partly to the weakening of the general staff at the War Office when its cream was skimmed off and dispatched to the Continent, the influence of the brain of the army was not for a time exerted very effectually in the councils of the Government. But that was only a passing phase. At a later stage the general staff was always at least allowed to express its views, even if its opinion was not necessarily accepted.

As a matter of fact its opinion was occasionally ignored in questions of considerable importance. This was no doubt partly due to some want of confidence in its judgment felt in Government circles owing to the slow progress made towards victory, and partly due to the personality and the temperament of certain members of the Government itself. The general staff also must have been sometimes at fault on occasions when its advice was rejected, although, should the full facts ever be made known impartially, posterity will probably pronounce it usually to have been right. Still, a general staff, however well-organized it may be and however gifted and informed its personnel, is not infallible. That this is so was demonstrated in the protraction for years of the World War, whereas the British general staff had at the outset confidently reckoned on its only lasting some months. The German general staff, again, looked with contempt upon the huge forces that Lord Kitchener was known to be improvising, until the value of the British "New Armies" was proved up to the hilt in the field; and at a later stage of the struggle it totally miscalculated and underestimated the military potentialities of the United States. Moreover, all the European general staffs alike, in their forecasts made in time of peace, underrated the wastage in personnel and the expenditure in ammunition in a modern campaign on a great scale.

It has been said that a general staff must "think politically." If this maxim is merely to be taken as meaning that a general staff should appreciate political habits of thought, watch political tendencies, and keep itself acquainted with the political aspects of every question influencing military action alike in peace and in war, its truth is indisputable. But one of the most important duties falling to the lot of a general staff, especially in times of emergency, will often be to strive to prevent mere policy from adversely influencing the conduct of operations of war or affecting Government decisions in connexion with military subjects. History provides some striking examples of political considerations gravely prejudicing the prospects of armies in the field. MacMahon's fatal march to Sedan was a case in point. The retention of Gen. Penn Symons' advanced force at Glencoe in the opening days of the Natal campaign of 1899 furnishes another instance. Had the question at issue been regarded solely from the soldier's point of view, it is more than doubtful whether Gen. Townshend would ever have been launched on his ill-omened effort to reach Bagdad in Nov. 1915. When problems of this kind present themselves, a general staff will often have a difficult and delicate rôle to play. But the golden rule to govern its conduct on such occasions would seem to be that it ought to regard and present the problem from the fighting point of view alone. The politicians can look after the political side.

It cannot be too clearly understood that neither in the United Kingdom nor in any other military state does the staff of an army in reality consist of a general staff alone. There must always be what, for lack of a more distinctive nomenclature, is called in the British service its "administrative" side—although in point of fact many of the duties of a general staff are necessarily of an administrative character. It is indeed the case that, at least in peace-time, the administrative staff of an army is in a sense the more important of the two. The army has to be recruited and fed and clothed and equipped, and its discipline has to be maintained, otherwise there will be no troops for the general staff to dispose of and there will be no *raison d'être* for the general staff. Whereas the general staff will often in peace-time be engaged on work which in the event may prove of little profit, the administrative staff is constantly busy disposing of questions which if not dealt with will cause a collapse. Calling the administrative staff "*adjutantur*" may alter its status and may lower its dignity, but does not alter the fact that it is a staff and that it performs staff duties. The organization as affecting the administrative staff that was introduced into the War Office in the United Kingdom in 1904, and in due course extended throughout the army (the details of which have been touched upon in earlier paragraphs), worked extremely well both at headquarters and with the troops during the pre-war period, and it also gave good results when subjected to trial at manoeuvres between 1909 and 1914. The same staff organization was extended to India shortly after it came into force in the United Kingdom. Nor, when it came to be put to the test in warfare on a gigantic scale in many parts of the world, was it found wanting. Although the problems engaging the attention of the quartermaster-general's staffs and the inspector-general of communications' staffs were in many respects fundamentally the same in the Gallipoli Peninsula, in Mesopotamia, and in France and Flanders, the wide differences in the geographical and topographical conditions as between the three theatres of war obliged the problems to be solved on separate lines in each case. In France and Flanders several railways connected the troops at the front with the secure and well-equipped ports that acted as bases. In the Gallipoli Peninsula open beaches under fire served for bases, and the communications were to all intents and purposes maritime. For most of the time in Mesopotamia it was a case of an army dependent on one single line of river communication, hundreds of miles long, although the river was gradually to some extent supplemented by specially constructed sections of railway. And yet the organization of the administrative staff as it had been designed in peace-time met requirements under these diverse sets of circumstances. Where failures occurred, they were due to errors in execution or else to lack of essential resources. Such alterations as have recently been carried out as a result of the teachings of the World War have been in detail and not in principle.

The British plan subordinates the administrative staff to the general staff less than is the common practice. This is perhaps due to the nature of British campaigns of the 1874-1902 era, campaigns fought in regions often destitute of communications and always poor in resources. Almost everything hinged on supply and transport in these contests, and the transport generally had to be improvised on entirely new methods for each particular case. Losses in action were as a rule trifling as compared to losses from disease. For one thought that the commander or his chief advisers gave to the enemy, ten thoughts were given to communications. Instead of looking to the front they were generally looking to the rear. Duties such as are now apportioned to the administrative staff greatly outweighed in importance duties such as are now apportioned to the general staff. There was little difficulty in beating the enemy if only supplies could be got up to permit a fight. But, to whatever cause it may be attributable, the fact remains that the chief of the general staff of a British army nowadays is merely in the position of *primus inter pares* relatively to the adjutant-general and the quartermaster-general—and it is the same at the War Office. In almost all other armies, on the other hand, including that of the United States, the chief of the general staff is definitely chief

of the staff. And he also is usually called chief of the staff, the heads of different branches of the administrative staff being absolutely subjected to him. The "chief of the staff" plan was moreover adopted in the case of several British campaigns of modern date, e.g. that of 1882 in Egypt and Lord Wolsey's and Lord Kitchener's expeditions up the Nile in 1884-5 and 1898. A chief of the staff was appointed to Sir R. Buller at the outset of the S. African War (although owing to unforeseen events he never took up the post), and at a later date Lord Kitchener went out as chief of the staff to Lord Roberts.

If the existing British staff organization comes to be compared with those where the chief of the general staff is also chief of the staff, it will be found that there is something to be said on both sides. That part of the British system under which a command or a district is in peace-time supplied with a superior officer in charge of administration, to whom wide responsibilities are allowed and who is generally in practice senior to the principal general staff officer, permits the general in command to devote nearly the whole of his attention to preparing his troops for war. But that arrangement would be unworkable in the field. There the progress of operations is so dependent on the work of the administrative staff that the commander cannot transfer his authority in connexion with the latter to somebody else—as is recognized in the British staff organization in time of war by the heads of the adjutant-general and the quartermaster-general staffs, as well as the inspector of communications, then dealing direct with the commander. Still, the fact that a peace arrangement does not fit in with the requirements of war is not a conclusive argument against that arrangement's holding good in peace-time, which after all represents the normal condition of things; and the British plan of a chief of administration is only a special feature in a larger question. Objections do undoubtedly exist in peace-time to the supremacy of the chief of the general staff. That automatically makes him responsible for the work of the administrative staff, and as all manner of administrative problems—unimportant problems, perhaps, but problems which have to be solved—are constantly arising in peace-time, most of the chief of the general staff's time may come to be occupied with matters that are not general staff matters at all, and military policy, manoeuvres, training of troops, higher instruction, defence schemes, and so forth, may suffer. But, if peace represents the normal state of affairs, armies none the less exist for purposes of war; and in time of war the case for the British system is not so strong.

In face of the enemy, operations—planning them, deciding whether the plan is feasible, and taking the necessary steps for their execution—are of paramount importance, but cannot be said actually to govern administration, for unless the army's establishments are maintained and unless it has its food, its ammunition, etc., it cannot carry out the operations. The success of the plan may in the main depend on strategic and tactical factors; but in framing the plan the duties which the administrative staff will have to perform in connexion with its execution must have been considered with meticulous care. It is for the administrative staff to say whether the plan is feasible from the point of view of supply, transport, depots, hospital service, and so forth. There may be great administrative difficulties in the way, which will as a matter of course be represented. It is, however, for the general staff to weigh the administrative as against the strategic aspects of the case and then lay the whole subject before the commander for a final decision. The British *Field Service Regulations* clearly admit by implication that the chief of the general staff is the superior of the adjutant-general, the quartermaster-general and the chief of communications, without their being actually under him. That, under conditions such as develop on active service, is apt to prove a somewhat clumsy arrangement and to give rise to friction. It is neither one thing nor the other. Granted that the "chief of the staff" system means centralization, granted that it demands from the chief of the general staff a somewhat closer acquaintance with purely administrative questions than would be necessary if the heads of the chief branches of the administrative staff were

virtually his equals, even granted that under it less of his time will be available for the consideration of the strategical and tactical situation than would otherwise be the case, the system does seem a more satisfactory arrangement for purposes of operations in the field than that which found favour in the British army after the setting up of the Army Council. Nor would it seem to follow as a matter of course that the "chief of the staff" system must not be adopted in war-time, simply because it does not obtain during peace. (C. E. C.)

**STAMBOLIISKI, ALEXANDER** (1879- ), Bulgarian statesman, was born at Slavovitsa in Bulgaria Sept. 1 1879. He was of peasant origin, but obtained a good education at Sofia and then at Halle in Germany. In 1902 he became editor of the newspaper of the Agrarian League and later entered the Sobranje. He soon acquired great influence among the peasants, and from the first took up an attitude of fearless opposition to King Ferdinand's policy. In 1908 Stamboliiski headed the Agrarian protest against the Declaration of Independence, as being in the interest of the dynasty rather than of the people. In 1911 he made a violent speech in the Grand Sobranje, opposing the amendment to the constitution by which the King was given the right to make secret treaties, and in 1913 he openly accused the King of having brought about the calamitous war with Serbia. On Sept. 17 1915 Stamboliiski accompanied the other leaders of the Opposition to the palace, and, in a forcible speech and later in personal conversation, he warned the King with characteristic *brusquerie* that if he again plunged the country into war it would end in disaster and that he would lose his throne, if not his head. Stamboliiski was then condemned to imprisonment for life, and was kept in strict and painful confinement from Sept. 30 1915 for three years; he was, however, allowed access to books and spent much of his time in study and writing. On Sept. 25 1918, when imminent catastrophe compelled Bulgaria to seek an armistice, he was released, and, after a stormy interview with the King, went to the front, where a revolutionary movement among the troops was developing. He returned with the insurrectionary troops to Sofia, and order was restored only after much loss of life; Stamboliiski was obliged to go into hiding, even after the King's abdication. The Government, however, soon realized that his help was essential in the critical state of the country, and he became Minister of Public Works in Todorov's Cabinet. Although the Agrarians had not an actual majority after the election of Aug. 1919, Stamboliiski became President of the Council and Minister for Foreign Affairs; on Nov. 27 he had the courage to sign the Treaty of Neuilly on behalf of his country. In April 1920 the Cabinet was reconstructed, Stamboliiski remaining as Premier, Minister for War and of Foreign Affairs in a Cabinet composed entirely of his own followers.

**STANFORD, SIR CHARLES VILLIERS** (1852- ), Irish musical composer (see 25.773), published in 1911 *Musical Compositions*; three years later appeared *Pages from an Unwritten Diary* and in 1916 *A History of Music*, written in conjunction with his former pupil, Cecil Forsyth. In later years his music included the operatic piece *The Critic* (op. 144), produced by Beecham in 1916, and *The Travelling Companion* (op. 146), which won a Carnegie award in 1917, but had not yet been produced in 1921. In 1919 his symphony *L'Allegro ed Il Pensieroso* also won a Carnegie award, and in 1921 his setting of a poem by Mr. Justice Darling entitled *At the Abbey Gate*—the point being the burial of the Unknown Warrior in the Abbey—was produced by the Royal Choral Society in the Albert Hall. Stanford's *Songs of the Fleet*, originally produced in 1910, gained great popularity, and he also composed much chamber music.

**STANMORE, ARTHUR HAMILTON HAMILTON-GORDON, 1ST BARON** (1829-1912), British administrator, was born Nov. 26 1829, the youngest son of the 4th Earl of Aberdeen. He was educated at Cambridge and afterwards entered politics, becoming private secretary to the Prime Minister, Lord Derby, from 1852 to 1855, and sitting as member for Beverley from 1854 to 1857. He was successively governor of Trinidad (1866-70), Mauritius (1871-4), Fiji (1875-80), New Zealand (1880-2) and Ceylon (1883-90). He was raised to the peerage in 1895, and

died in London Jan. 30 1912. He was succeeded by his son, George Arthur Maurice Hamilton-Gordon, born Jan. 3 1871, who in 1916 was appointed lord-in-waiting to King George V.

**STEAD, WILLIAM THOMAS** (1849-1912), English journalist (see 25.817), was drowned on the "Titanic" April 15 1912.

**STEED, HENRY WICKHAM** (1871- ), English journalist, was born at Long Melford, Suffolk, Oct. 10 1871, the son of a local solicitor, and was educated at Sudbury grammar school and the universities of Jena, Berlin and Paris. From 1896 to 1913 he acted continuously as foreign correspondent to *The Times*, beginning in Berlin, passing on to Rome, where he remained five years (1897-1902), and thence to Vienna (1902-13). His *Hapsburg Monarchy* (1913; 4th ed. 1918) is recognized as the most illuminating work that has been written on Austria-Hungary. In 1914 he became foreign editor (in London) of *The Times*, and in Feb. 1919 was appointed to succeed Mr. Geoffrey Dawson as editor. During the World War he was a prominent supporter of the Yugoslav movement. In 1918 under Lord Northcliffe he was engaged on propagandist work in the enemy countries, and he headed a special mission to Italy in March and April of that year. His other publications include *The Socialist and Labour Movement in England, Germany & France* (1894); *L'Angleterre et la Guerre* (1915); *L'Effort Anglais* (1916); *La Démocratie Britannique* (1918).

**STEER, P. WILSON** (1860- ), English painter (see 25.868), exhibited after 1886 practically the whole of his work at the New English Art Club, in whose formation he took a leading part and of which he was at one time president. His earlier work, such as the "Boulogne Sands" showed the influence of impressionism in its feeling for light and its handling of colour; but after 1895 he adopted a more sober palette, at times using strong black shadows with silvery lights, and gave increased attention to design. After 1900 he returned to the use of a full range of pigment, and produced some of his finest work, such as "Richmond after Storm" (1903) and "The Isle of Purbeck" (1909). In later years he only used the impressionist colour analysis to a very limited extent, and generally worked within a chosen and limited colour scheme. His feeling for colour harmony and power of rendering subtle variations in tone relate him to Gainsborough (a likeness well exemplified in "The Beaver Hat"), and give his work its characteristic quality. Most typical perhaps are his landscapes, mainly wide stretches of country with broken skies, full of light, atmosphere and a sense of space; but he also produced many portraits and figure compositions, his paintings of the nude being marked by great appreciation of the character and quality of flesh. His later work includes "A Summer Evening" (1914), "Painswick Beacon" (1916), "The Vale of Gloucester" (1917), "Chirk Castle" (1917), and a considerable group of water-colours, very delicately and directly handled. A self portrait is in the Uffizi Gallery, Florence, and he is represented in the Tate Gallery, the Municipal Gallery, Dublin, and the Johannesburg Gallery.

**STEFÁNSSON, VILHJÁLMMUR** (1879- ), Canadian explorer, was born at Arnes, Manitoba, Nov. 3 1879, of Icelandic parentage. He was educated at the universities of North Dakota and Iowa, and afterwards at Harvard. He became a newspaper reporter, but later was appointed to an instructorship of anthropology at Harvard, and became deeply interested in the problems of the Arctic regions. He made a private expedition to Iceland in 1904, and the following year returned with a Harvard archaeological expedition. He visited the Eskimo of northern Alaska (1906-7), and in 1908 started on a four years' expedition to the Arctic shores of Canada under the auspices of the Geological Survey of Canada and the American Museum of Natural History, with interesting results. In 1913 Stefánsson was appointed commander of the Canadian Arctic expedition which sailed from Victoria, B.C., in June of that year to explore the northern shores of Canada and Alaska. In 1914, with two companions, he crossed Beaufort Sea on the moving ice from Martin Point, Alaska, to the north-western corner of Banks I.; in 1915 he visited the sea west of Prince Patrick I. and discovered more land to the north; and in 1916 discovered land west of Axel

Heiberg Island. The following year he travelled, again over moving ice, as far as lat. 80° 30' N. and long. 112° W. The expedition returned to Canada in 1918 (see ARCTIC REGIONS). Stefánsson published *My Life with the Eskimo* (1913), *The Friendly Arctic* (1921) and an anthropological report on the expedition of 1908-12, besides many articles in scientific journals. He received many honours from learned societies.

**STEIN, SIR (MARK) AUREL** (1862- ), British archaeologist, was born at Budapest Nov. 26 1862. Educated in the public schools of Budapest and Dresden and afterwards at the universities of Vienna and Tübingen, where he studied Oriental languages and antiquities, he went to England for further study and then to India, where he became principal of the Oriental College, Lahore, and registrar of the Punjab University in 1888. Eleven years later he was appointed to the Indian Education Service, and for the next two years carried out archaeological explorations for the Indian Government in Chinese Turkestan. In 1906-8 he made further explorations (see 27.425) in central Asia and western China, receiving the gold medal of the Royal Geographical Society. From 1909 he was superintendent of the Indian Archaeological Survey, and in 1913-6 carried out explorations in Persia and central Asia, described by him in the *Geographical Journal* (1916). He was created K.C.I.E. in 1912. His other publications include *Chronicle of Kings of Kashmir* (1900); *Ancient Khotan* (1907) and *Ruins of Desert Cathay* (1912).

**STEVENSON, ALDAI EWING** (1835-1914), American political leader (see 25.907), died at Chicago June 13 1914.

**STEWART, JULIUS L.** (1855-1919), American painter (see 25.914), died in Paris Jan. 4 1919.

**STEYN, MARTINUS THEUNIS** (1857-1916), Dutch S. African politician (see 25.915). After the prominent share which he took in the work of the S. African National Convention in 1909-10 ex-President Steyn retired into private life at his farm, Onze Rust (Our Rest), near Bloemfontein. From this retirement he never emerged till his death Nov. 28 1916, except to address occasional meetings of the Dutch people of S. Africa on topics of national interest. Yet this almost complete retirement from public activities did nothing to lessen his influence with his own people. It cannot be said that this influence was exercised to promote racial peace in S. Africa. When the dissension between Gen. Botha, the first Prime Minister of the Union of S. Africa, and Gen. Hertzog began to shake the frame of the Ministry, ex-President Steyn might have had a decisive influence in composing that difference, which was ultimately to break Gen. Botha's Cabinet and to lead to long dissension among the Dutch-speaking people of S. Africa. His weight, however, was thrown without reserve on the Hertzog side. The ideas of ex-President Steyn were the ideas of Kruger. He held with tenacity the creed of the Boer who regarded himself as the holder of S. Africa by a species of divine right, who resented the intrusion of the British element, and was determined to treat that element as intruders and "foreign adventurers." Beyond doubt they were sincere, if narrow. He held, as Kruger had held, and as Gen. Hertzog held, that the intrusion of the British element involved a descent into the muddy waters of commercialism, the strife of contending ideas and embroilment in the tangles of world-politics.

**STINNES, HUGO** (1870- ), German industrialist and financier, was born at Mülheim on Feb. 12 1870. He was the son of Hugo Stinnes, and grandson of Matthias Stinnes, who was the founder of a firm in no great way of business at Mülheim in the Ruhr district. After passing his leaving examination from a *Realschule*, young Stinnes was placed in an office at Coblenz where he speedily picked up the elements of a business training. In order to get a practical knowledge of mining he worked for a few months as a miner at the Wiethe colliery. He then, in 1889, attended a course of instruction at the Academy of Mining in Berlin. In the following year he entered the firm which his grandfather had founded. He remained there only two years and then established a firm of his own, Hugo Stinnes, Ltd. The whole original share capital was 50,000 marks (pre-war = £2,500). Gradually, from dealing in coal, he became

himself the owner of several mines and extended his business to the manufacture of different kinds of fuel such as briquettes. He also began to purchase sea-going vessels as well as river steamers and barges, the latter, especially on the Rhine, on a constantly increasing scale. He next organized an extensive international business in coal, and had 13 steamers trading to and from North Sea, Baltic, Mediterranean and Black Sea ports. They carried coal, wood and grain, also iron-ore, Stinnes having begun to manufacture iron and steel. He also imported great quantities of English coal and had an agency at Newcastle as well as an interest in some English mines. This led to his establishing branches of his business at Hamburg and at Rotterdam. Before the World War he was the possessor of a fortune which was vaguely estimated at several millions of pounds. He was a director of many of the greatest industrial and mining companies of Westphalia, the Rhineland and Luxemburg. Business interests of this magnitude were constantly expanding, and he became interested in numerous subsidiary enterprises, such as tramways and the supply of electric power and light. He was always engaged in founding new concerns or amalgamating existing ones. Stinnes managed to maintain an extensive and even a detailed knowledge of the working of all the concerns in which he was engaged, and in all of them to exact zealous and conscientious work from his business subordinates. The secret of his success was essential unity of direction and co-ordination of aims in all branches of his enterprises.

When the World War broke out he secured an enormous share in the war profits which flowed into the coffers of the great industrialists. In enemy countries, it is true, his enterprises were sequestered, and his firm at Rotterdam placed on the Allies' "black list." But he was richly compensated, apart from the regular indemnification paid by the German Government, when he was called in by Ludendorff as the most competent expert to give advice, to organize the coal and the industrial production of occupied Belgium and to help to set in motion the gigantic production of war material which the German G.H.Q. demanded from the homeland. His connexion with Ludendorff led to his becoming an influence behind the scenes in German politics, and, after the revolution, to his entering the Reichstag, as well as to his debut as a newspaper proprietor on a grand scale. During the war he had extended his activities in Hamburg and had bought up in 1916 the Woermann and the E. African lines. In these fresh undertakings he became associated with the two greatest German shipping concerns, the Hamburg-American line and the North German Lloyd. His Hamburg interests continued from that date onwards to multiply in something like geometrical progression. Half a dozen landed estates were purchased in Saxony to supply timber for pit props. At Flensburg in Schleswig he secured control of the largest Baltic shipping concern, and proceeded to build a new fleet of ships, christening one of them the "Hindenburg." In the elections of June 1920 he secured a seat in the Reichstag as a member of the Deutsche Volkspartei, the new electioneering name of the former National Liberal party. He had about the same time begun to buy up leading German newspapers, one of his main objects being to organize a solid and powerful bloc of opinion in Germany in support of law and order and the promotion of the highest industrial and commercial efficiency. His newspaper purchases included the *Deutsche Allgemeine Zeitung* in Berlin, formerly the organ of Bismarck and then of all succeeding German Governments, the *Münchener Neueste Nachrichten* and the *München-Augsburger Zeitung*, the last-named being one of the oldest newspapers in Germany. Both of the South German journals were previously exponents of a very much more democratic trend of opinion than that which came to characterize them under the new proprietorship. Ancillary to these acquisitions large interests were secured by Stinnes in paper-works in order to make his newspapers independent of the paper market.

In the autumn of 1921 he was reported to be contemplating some still vaster venture in the nature of a super trust to control every industry in Germany, so that the whole might ultimately

be coördinated like one gigantic concern regulating production, transport and the supply of the German markets and those of the whole world. It might thus be possible to avoid waste, sudden crises, ruinous competition and foreign commercial dictation. He was reported to have already expended the equivalent of about £250,000,000 on these aims and to be continuing to sink further millions in them. The Social Democrats were believed not to be averse from Stinnes' vaster scheme, as it corresponded in certain aspects with their own plans, when they were in power, for coördinating all German industries, pending the possibility of socializing them. An instrument for superintending this coördination in the social and economic aspects was ready to hand in the Economic Council of the German Reich, set up by the new Republican constitution of 1919.

The only public check which Stinnes was known to have received in the course of his career was at the Spa Conference in 1920, when he attempted to address that assembly in peremptory language concerning the impossibility of the coal deliveries demanded by the Allies and was summarily silenced by the president.

**STOCK EXCHANGE** (see 25,930).—Before the outbreak of the World War in Aug. 1914 the London Stock Exchange had for several years experienced two remarkable periods of activity, both being the outcome of industrial development which caused a rapid intensifying of the demand for two commodities—namely, oil and rubber. This was the sequel to the discovery of the internal-combustion engine and its increasing adoption in mechanical road transport.

*Pre-war Rubber and Oil Booms.*—The rubber boom came first. It began in 1909, and lasted until about 1912. The demand for rubber applied a great stimulus to the rubber plantation industry in the Malay States, the Dutch East Indies, Ceylon and India. The price of rubber rose at one time to over 12s. per lb., and an enormous number of new companies were formed, mostly with capitals of moderate size. In order to popularize rubber as an investment the resourceful company promoter introduced shares of the denomination of 2s. each. The innovation was extraordinarily successful, and a very large number of companies were floated with capital divided into 2s. shares, while others formed prior to the boom sub-divided their shares into the smaller and more popular denomination. Prices of shares rose to extraordinary heights. Premiums of thousands per cent were common, the shares of the Patalung and Selangor companies, two of the earliest plantation companies, rising to premiums in excess of 3,000 per cent. In Stock Exchange parlance the public "got the bit between its teeth," and the boom persisted for a long time. Large fortunes were made by people who participated in the boom in the early period. A reaction in the price of rubber, which ultimately fell below 1s. per lb. in 1921, had already put an end to the boom before the war began. Although the extravagant prices paid during the boom were at no time justified, the companies paid very satisfactory dividends for years; and it was not until the post-war depression, which was unparalleled in its severity, swept over the commodity markets in the latter part of 1920 and the first part of 1921 that the industry was faced with real difficulties. The tremendous stimulus applied to planting in 1910, 1911 and 1912 led to the inevitable overproduction, and in 1919 and 1921 schemes for limiting output were put into force.

The oil boom began shortly after the activity in rubber had been well spread. It persisted for a longer period, for the reason that the price of oil rose steadily from the introduction of the motor-car. It eventually reached its maximum height in 1920, but a reaction began in 1921, and this produced a corresponding movement in the share market. There was an enormous demand for petroleum spirit in the war period, and the price rose steeply. After the cessation of hostilities the price rose further, a circumstance which was partly due to the conversion of locomotives and ships' engines from coal to oil, partly to the great extension of mechanical transport on the road and in the air, and partly to the fact that the refinement and distribution of oil was in the hands chiefly of two vast organizations. The boom was accom-

panied by the flotation of a number of companies, particularly in Russia, where the Malkop field for a time attracted much attention. But in comparison with rubber, oil did not provide the same opportunities for the company promoter, and the flotation of companies for the exploitation of oil-fields, known and unknown, was comparatively limited. The oil boom lasted approximately 10 years, when a reaction set in. But meanwhile huge fortunes were made. Bonus shares were issued in great numbers by the principal oil companies, and this, together with high dividends, kept public interest at a high level.

With the exception of the oil market, stock markets were in a depressed condition for some time before the outbreak of war.

*The War Period.*—Early in July 1914, rumours of war began to affect the Continental bourses. On July 13 the Vienna market was demoralized by fear of hostilities, but it was not until July 24, when the terms of the Austrian ultimatum to Serbia were made known, that the London market became seriously perturbed. From that date until Friday July 31, when the London Stock Exchange Committee for General Purposes decided to close the House for an indefinite period, markets were inundated with a vast flood of selling orders from home and abroad, and excitement was intense. The European bourses virtually ceased to function, and this diverted an enormous stream of foreign selling orders to London. Inter-bourse securities naturally suffered a very heavy decline. On Monday July 27 many London jobbers ceased to "make prices." This was "general carry over" day, and the difficulties to be met by speculators were formidable. The settlement, however, was completed on Wednesday July 29, without any very serious disaster, though 9 failures, involving 20 members, were announced. Dealing, however, had become a matter of negotiation entirely, and on Thursday July 30 1914 the House opened for the last time that year. During the first two hours no attempt was made to do business, and the next morning the committee decided not to reopen the House until further notice. On Monday July 27 four consecutive transactions in consols were officially recorded at prices showing a movement of £1 between each bargain, a circumstance without precedent in modern London Stock Exchange history. During the closed period, business, despite official discouragement, was not entirely suspended. A certain amount of dealing, on a strictly cash basis, was found to be possible. On Sept. 14 the committee fixed minimum prices for trustee stocks, based on the quotations ruling on July 30, the object being to prevent disastrous depreciation. The New York Stock Exchange similarly made minimum prices for American shares, and these values were adopted by the London committee. The maintenance of these prices was insisted upon by the banks, which had undertaken to continue their loans against securities without asking for any additional margin.

Meanwhile the question of dealing with the uncompleted mid-August account was taken in hand on the London Stock Exchange and completed on Nov. 19, a special set of rules governing its arrangement. The gist of these rules was that bulls of stock carried over on July 27 should put up a 5% margin on high-class securities, and 10% on others, and pay interest fortnightly, or alternatively pay a higher rate of interest in lieu of margin. The "taker in" was put under the obligation of continuing to "take in" stock at July 27 prices until 12 months after the war, or the expiring of the Courts (Emergency Powers) Act, 1914, whichever event was the sooner. The declaration of a moratorium, which was continued until Nov. 4 1914, made it impossible to reopen the Stock Exchange for some months. About £90,000,000 had been borrowed against securities before the war began, and it was not until the moratorium came to an end that the mid-August settlement was carried through. The affairs of a small number of members were in this operation wound up under the liquidation rule, but the amount of stock carried over under the temporary regulations was smaller than had been feared. As stocks rose to the mean price of July 27 they had to be taken up or sold. On Dec. 23 1914 the conditions governing the reopening of the London Stock Exchange were promulgated. The minimum price list was then extended to

include inter-bourse securities. Minimum prices were gradually abolished as liquidation ceased and prices settled down to the new level of investment values. On July 3 1916 the last of the minimum prices were removed.

The London Stock Exchange was reopened for the first time after the outbreak of war on Jan. 4 1915. Severe restrictions were placed upon the transaction of business, in accordance with arrangements made in Dec. 1914, between the Committee for General Purposes and the Treasury. These arrangements were embodied in Temporary Regulations which were substituted for the old regulations governing Stock Exchange practice. All bargains had to be done on a cash basis. The suspension of virtually all speculative business was the most important innovation introduced by the Temporary Regulations. Normally, speculation forms the great bulk of business effected on the Stock Exchange, and its temporary abolition deprived many members of their occupation. The volume of business which it was possible to do was further restricted by two other features of the Regulations—namely, the "physical possession" rule, which prohibited dealings in stock that had not been in physical possession in the United Kingdom since Sept. 1914, and the fixing of minimum prices for trustee and other securities, which were in nearly every case the mean prices on July 27. Both of these rules were relaxed to some extent during 1915; the former to facilitate sales of American securities held in Allied and neutral states, and to allow sales of colonialily held stock. When they were established, minimum prices undoubtedly served a very valuable purpose, but when the issue of high-yielding war loans completely altered the standard of investment, as regards the yield in interest, no useful purpose was served by them. The retention of minimum prices fixed on a pre-war basis of credit made it impossible to deal in the securities affected, and that was the reason for their removal. But the absence of speculation naturally caused a considerable reduction in membership. On the day of reopening the number of transactions was less than 1,000. On subsequent occasions the number rose to well over 3,000 per day, but in 1915 the daily average was nearer 2,000 than 3,000. A heavy loss of revenue was sustained by the company owning the Stock Exchange, and in 1915 it failed to distribute an interim dividend.

The arrangement by which all stocks carried over at the outbreak of war were continued until after the end of the war, unless the "end of July 1914" prices were reached, worked well in practice, thanks largely to the American demand for securities; and the "open" position on the London Stock Exchange, which in Aug. 1914 was about 90 millions sterling, had been reduced by the end of 1915 to about 20 millions.

With the reopening of the London Stock Exchange an important reform was introduced which was continued after the cessation of hostilities. The Temporary Regulations provided that every bargain should be recorded. This practice was much preferred by the public to the pre-war custom of marking only occasional bargains. The absence of buying and selling prices, dealers being prohibited from offering stock in the market, was one of the reasons for the compulsory marking of all bargains. This reform led to the issue of a supplementary list of bargains in securities not quoted in the daily "official" list. Thus, from Jan. 4 1915 onwards, a complete record of business done was furnished by the two lists, on the authority of the committee. Another innovation was the retention in the lists of prices of previous bargains, which added to their value to the public.

The course of prices in 1915 and subsequent war years was generally downward. In June-July 1915 the flotation of the unlimited 4½% British Government War Loan made a lowering of investment values inevitable. This for a time checked business in the stocks protected by minima, and caused a heavy fall in other fixed interest-bearing securities. In March 1915 minimum prices were reduced to a small extent. The minimum for Consols was reduced from 68½ to 66½ prior to the issue of the 4½% War Loan, and it was removed later when the great bulk of the stock had been converted into the 4½% stock. The market for American securities was very active and strong throughout 1915, and

prices showed a substantial advance on the year. The war-time prosperity in the United States caused a great demand for American securities held in the United Kingdom and France. European holders were encouraged to sell by the appreciation of the dollar in terms of sterling, which enabled a profit on exchange to be made. In the second half of the year the British Government bought large quantities of American securities held in the United Kingdom and sold them in the United States in order to provide itself with means of making payment for munitions, etc. (see DOLLAR SECURITIES MOBILIZATION). It is estimated that in this year about 150 millions sterling of American securities were transferred to the United States. Towards the end of 1915 the Government ceased operations in the market, and invited holders either to sell or loan approved securities to it. Thus came into force what was subsequently known as the Dollar Securities Mobilization Scheme. The terms of purchase were approximately the parity of the New York price, and for loan a bonus of  $\frac{1}{2}$ % per annum in addition to the interest or dividend on the loaned security, plus a premium of  $\frac{1}{2}$ % in the event of the Government exercising its right to sell the stock loaned to it. The Temporary Regulations were made more stringent as the war continued, but 1917 witnessed a check to the depreciation of fixed interest-bearing securities for the first time since the S. African War of 1899-1902, and also a sustained upward movement in industrial securities.

The following table, compiled from figures published by the *Bankers' Magazine*, shows the course at different important dates of investment values since the calculations were first made. The values relate to 387 representative securities:—

Jan. 1907	• • • • •	£3,843,000,000
*July 20 1914	• • • • •	£3,371,000,000
†Nov. 1918	• • • • •	£2,822,000,000
Dec. 1919	• • • • •	£2,634,784,000
Dec. 1920	• • • • •	£2,319,777,000

\*Pre-war. †Month of Armistice.

The general depreciation was due not only to the exceptionally heavy demand for money to carry on the war, but also to the growing burden of direct taxation in the United Kingdom. For a time the British investor showed a marked preference for industrial securities, on which high dividends were paid together with, in many cases, bonuses either in the form of cash or scrip. Bonus shares were created and issued by a large number of concerns. The scarcity of capital caused a steady rise in the rate of interest, and first-class companies found it necessary to pay 8% and even more on new debentures and preference capital. The Treasury scheme for buying and borrowing dollar securities in 1916 was followed in 1917 by a scheme for requisitioning those which had been neither lent nor sold. This put the finishing touch to the process which had begun in 1915, of extinguishing the American market in London.

Throughout the war period the London Stock Exchange Co. had a very lean revenue. Receipts, which in 1914-5 amounted to £296,757, dwindled to £130,304 in 1917-8; and the dividend dropped to £1 per share.

A feature of the year 1918 was the advance in foreign Government securities, especially those of neutral nations. Bonds of the neutral countries were bought for exchange purposes, and they changed hands up to extraordinarily high figures in the first half of the year. Spanish 4's touched 135 at one time, owing to the rise in the sterling value of the peseta, and Swedish  $\frac{3}{2}$ % stock rose to 115, through appreciation in kronor.

Calculations made by the *Bankers' Magazine* show that the values of 387 representative securities fell during 1919 from £2,801,089,000 to £2,634,784,000, a decrease of £166,605,000, equal to 5.9 per cent. (As on July 20 1914, the total was £3,371,000,000, the decline in the five and a half years to Dec. 1919 was no less than £736,216,000, or nearly 22 per cent.) At one time during the war the values touched £2,572,000,000. This was on April 20 1918—at the height of the Germans' last great offensive effort. It is interesting to note that in Jan. 1907, when the valuations began, the total was £3,843,000,000. The valuation at the end of 1919 showed a net shrinkage of £1,208,000,000, or 31½%, of

which £736,216,000 was due to conditions brought about by the war. The war-time depreciation in fixed interest-bearing securities was greater than this. Taking the values of 108 fixed interest-bearing securities we find that the total on July 20 1914 was £1,089,000,000, at the close of 1918 £1,575,000,000, and at the end of 1919 £1,378,906,000. On the other hand, the value of 279 speculative investments, i.e. the dividends on which fluctuate according to profits, was £1,382,000,000 on July 20 1914, at the close of 1918 £1,226,000,000, and at the end of 1919 £1,255,578,000. Thus there was a net depreciation in fixed interest-bearing securities of £610,094,000, or 30%, in the whole war period, of which £196,094,000 occurred in 1919; while speculative investments showed an increase of £29,578,000 in value during 1919, or 2.4%, but a net depreciation of £126,422,000 on the whole period, or 9 per cent.

*After the War.*—In spite of marked activity in speculative investments, the year 1919 witnessed a generally downward tendency in prices of securities, with the result that a large part of the appreciation which took place in the closing months of 1918, following the collapse of Germany's war effort, was lost. The reaction was due in a large measure to heavy Government expenditure, bringing with it the pressure of high taxation, and an adverse American exchange, the former involving a continuance of heavy borrowing, and the latter a rise in the Bank of England rate from 5 to 6% at the beginning of Nov. 1919. The failure of the British Government's Funding Loan operation in the summer had an adverse effect on the market for gilt-edged investments, and the City of London received something like a shock on learning that national expenditure in the second half of the year was scarcely distinguishable in amount from that of a large part of the war period. Markets, however, presented a generally animated appearance. This was in part due to the return of warrior members. Attention was mainly concentrated on speculative securities, notably oil, brewery, insurance, shipping, S. African gold, and commercial and industrial securities. Fixed interest-bearing securities were persistently neglected, owing to the higher value of money and the competition of numerous new issues offering yields as high as 9 per cent. In the summer of 1919, various war-time restrictions were removed from the London Stock Exchange with the approval of the Treasury. The removal of the embargo on exports of capital enabled foreign-held stocks to be realized in the London market; but arbitrage transactions continued to be prohibited. Some of the declarations which had to accompany each transaction were abolished, but the temporary regulation prohibiting any but cash transactions was retained.

Gold-mining shares made a substantial advance in the closing months of 1919 owing to the high premium received on gold under an arrangement come to in July for restoring free conditions to the market for gold newly produced. This enabled the companies to declare larger dividends in Dec., and rescued a large number of low-grade mines from imminent bankruptcy. Towards the close of 1919 Rand Mines shares were introduced on the New York market, this being the first time that S. African gold shares were listed in Wall Street. The diamond companies enjoyed a wonderful prosperity during the year, the De Beers Co.'s revenue amounting to as much as one whole day's war expenditure at the maximum level. Record dividends were paid, and share quotations reached unprecedented figures.

The year 1920 was the most remarkable of the early post-war period. At the beginning markets in London were extraordinarily active, owing to the boom in trade. The oil market was in a state of ceaseless activity, and other speculative markets felt some of the reflected glory of inflated oil profits. Nomination for membership of the London Stock Exchange rose in price to £650, but was almost unsaleable at the end of the year. There was a great congestion of work in brokers' offices in the early months, and they were kept open until late at night for several weeks. But the introduction of a British budget of 1,200 millions, with its unpleasant reminder of the burden of taxation, administered a check to the reckless buoyancy of markets. The collapse of the exchanges of all the countries except the United States

Sweden, Switzerland and Holland, caused a steady stream of liquidation in London from the Continent, which grew in volume when, later in the year, a heavy fall occurred in wholesale commodity prices. The fall in commodities forced traders to realize securities. The pressure to obtain money to finance production and distribution and pay taxes caused persistent liquidation in the gilt-edged market, and British Government securities fell to a level giving a return of well over 6% per annum. In Dec. 1920 the leading stocks, in some cases, touched the lowest points on record. The 5% War Loan fell to 81  $\frac{1}{8}$ , Victory Bonds to 70  $\frac{1}{2}$ , Funding Loan to 65  $\frac{1}{2}$ , and Consols to 43  $\frac{1}{2}$ . The *Bankers' Magazine* calculations of the prices of 381 representative securities in Dec. 1920 showed a fall in values of no less than £315,000,000, the largest loss ever recorded in one year. British and Indian funds fell in value in 1920 by 11.9%, foreign Government stocks by 18.8%, home railway stocks by 17.3%, foreign Government stocks by 23.5 per cent. The decline in commercial and industrial securities was much greater, the percentage being 40.9. The severity of this reaction was, of course, due to the sudden collapse of the six-year-old boom in trade. Iron and steel shares suffered a depreciation of 33.7%, shipping securities of 21.7%, and S. African mining shares of 39.2 per cent. The losses of the investor were so severe that he lost all interest in speculative stocks and turned his attention to gilt-edged stocks. This brought about a steady recovery in the latter in the first half of 1921. The issue of foreign Government loans in London, which was suspended on the outbreak of war, was renewed in 1921, when a loan to the Sao Paulo Government was issued, followed by an issue of Norwegian Government bonds.

*American and Foreign Stock Exchanges.*—The shock of the World War caused stock markets all over the world to shiver and collapse more or less. By custom London was a market to which every *bourse* abroad turned for help when there was any pressure, and for a period of at least a fortnight after the middle of July 1914 the London market was called upon to absorb a flood of selling orders from every mart in Europe where securities were dealt in. While the European *bourses* had to all intents and purposes suspended business by the beginning of the week ended Aug. 1, there was a fairly free market for securities in London in the great majority of international securities down to the middle of the week. The news of the coming war affected the European *bourses* early in July. On the 13th of that month the Vienna market was described as having become quite demoralized by the fear of war. The Berlin *bourse* reflected this nervousness because Germany was Austro-Hungary's chief lender, Government and municipal loans of the Habsburg Empire being held in Germany to the extent, it was estimated, of over £200,000,000. On Monday July 27, the day before the declaration of war by Austria, the panic in Vienna was such that the *bourse* was ordered to be closed for three days. Subsequent events showed it was destined to be closed for an indefinite period. The Brussels market followed the lead of Vienna, ceasing business on July 27, and the Paris *coulisse*, or outside unofficial market, also suspended operations on that day. On Tuesday July 28, before the declaration of war by Austria had become known, dealings became very difficult. On July 29 all account dealings in Berlin were suspended, transactions being confined to cash bargains. The Amsterdam and St. Petersburg *bourses* were entirely closed that day, while on Thursday all markets suspended business except London, Berlin, Paris and New York, but the settlement in Paris fixed for July 31 was postponed. Business on the Berlin *bourse* was ordered to be suspended on the following day (July 31), though the *bourse* was kept open. The Paris market remained open throughout that day, July 31, but only six quotations were available out of some sixty stocks and shares usually quoted in reports from that centre. The Paris *bourse* was the only stock-market to keep open its doors after Thursday July 30. But this *bourse* is under the direct control of the Government, and the authority of the Government was no doubt responsible for the *bourse* being kept open. Down to Sept. 2 a few quotations were forthcoming from Paris, but on that day the *bourse* was shut until further notice owing to the

approach of the Germans to the French capital. The New York Stock Exchange was open on Tuesday July 28, when the news of the declaration of war by Austria first became known, and it was called upon to withstand the first shock of that announcement. By the end of the day's session it was found that transactions for the first time that year (1914) had exceeded one million shares. On Tuesday July 28 the Toronto Stock Exchange was closed, after being open for 10 minutes, and business on the Montreal market ceased in the afternoon. On July 30 violent breaks in prices occurred on the New York Exchange, but there was at all times a market. The next day, however, the committee decided to follow the lead of London and to close the Exchange.

*New York.*—In the latter part of 1912 there was a serious decline in American securities, owing to selling from Europe brought about by the Balkan War, but as soon as this unloading ceased the market was much unsettled by the decision of the Supreme Court of the United States ordering the dissolution of the Union Pacific-Southern Pacific merger. Down to the beginning of the World War New York had shown a tendency to develop more and more as a market for international securities, though very little was actually done to encourage foreign securities to seek a market there. In the short and frantic period in the last few days of July 1914 bankers saw ordinary standards of value scattered to the winds and loans aggregating \$2,000,000,000 imperilled almost in a night. When the House was closed special committees were set up to undertake the stupendous task of straightening out the apparently hopeless tangle of contracts outstanding when operations were suspended.

The New York Stock Exchange tentatively opened its doors again on Nov. 28 1914, for trading in bonds only. As the experience was encouraging, the committee decided to reopen the House for regular trading on Dec. 13. Minimum prices had been fixed by the committee on Oct. 13, and trading in unlisted securities was resumed on the following day. The minimum prices were revised from time to time and abolished on March 31 1915, owing to a rise in quotations having rendered minima no longer necessary. Then began the most remarkable era in the history of the Exchange. In point of feverish activity and wild fluctuations in prices, the year 1915 was then without precedent. Million-share days, sensational advances, and equally sensational declines, were common occurrences. Price movements were very erratic. The most conspicuous feature of the enormous volume of trading was the participation by the outside public seldom if ever before witnessed on the New York Exchange. Under clique and pool manipulation, prices were whirled upward with startling rapidity. Stocks which led the advances were those of companies which, it was supposed, would benefit most largely from war orders. Throughout the year there was heavy buying of both stocks and bonds by investors and financial interests of the first rank. Many securities reacted from their highest levels before the close of the year, but others, on good business prospects, retained the greater part of their phenomenal rise. Even more remarkable was 1916. Activity was intense, and prices rose to exceptionally high figures. Every dollar security offered from Europe was eagerly snapped up.

The following year witnessed a reaction. The depreciation in the market value of American railway securities was estimated at \$3,000,000,000—about one billion in bonds and two billions in shares. The principal causes of this great shrinkage in the market value of railway securities, in which about one-twelfth of the wealth of the United States was invested, were reported to be as follows:—

(1) Enormous destruction of capital in the war, with unprecedented Government loans at rising rates of interest.

(2) The liquidation by Europe of about \$1,700,000,000 of American railroad securities in payment for munitions of war.

(3) A rapid advance in the cost of railroad materials and labour, with no compensating advance in railroad rates, and fear on the part of investors that the Government would not promptly raise rates to maintain railroad property and credit.

When the U.S. Government declared war, the composure and strength of the Stock Exchange was an impressively favour-

able omen. This composure did not continue throughout the year. Prices of outstanding bonds declined steadily; and in Sept. and Oct. an extremely violent movement of liquidation swept over the Stock Exchange, carrying prices of the best investment stocks down to a level lower than that of the panic of 1907. This extreme demoralization of the Stock Exchange did not result from money tension—lending rates were comparatively low throughout the year—nor was it primarily a consequence of decreased earnings or of a weakened economic position on the part of the investing public. It was due to war taxation legislation, and the drawing up of estimates as to how much would have to be raised by taxes and by loans. In 1918 there was a recovery, with prices generally higher on the whole.

In 1919 there was a boom in stock markets which will rank in American finance as one of its greatest historical episodes. The pegging of sterling exchange at \$4.76½ was removed on March 20 1919, and the other Allied exchanges were released a few days later. But the depreciation of European currencies which followed did not stop European purchases. These increased in volume, and the demand acted as a powerful stimulant on the stock market. There began a speculation in stocks of an unprecedented description. Thousands of industrial corporations were endowed by the war with enormous reserves of cash which war taxation had barely skimmed. The atmosphere of Wall Street was charged with the wildest rumours of "melon splitting," increased dividends, and Liberty Bond distributions. Prices advanced by 10 and 12 points in a day, and on some days 20- and 30-point rises were not uncommon. Amidst this furious activity the million-share day ceased to be exceptional. In May the Stock Exchange was obliged to close on Saturdays in order to give the staffs an opportunity of overtaking arrears of work. When, in the latter part of June 1919, the first reaction occurred, there had been 46 consecutive million-share days. The rise in the value of money was said to be the chief factor which brought the boom to an end. By the middle of Oct. the Federal Reserve Bank of New York found its proportion of reserve to liabilities reduced below the minimum prescribed by law. Call money rose to 30% in Nov., the highest figure since 1907. A coal strike, the heavy fall in the exchanges, and the failure of the Senate to ratify the Peace Treaty, were depressing factors.

Stocks reached the peak of the rise in Nov. 1919. On that occasion the figure was only fractionally below the high-water mark of the war period, viz. 101.51, which marked the culmination of what was described in the picturesque language of Wall Street as the "war-brides" boom of 1916. Then followed the bursting of the distended balloon. In about three weeks the average price of 50 stocks dropped more than 15 points to 85. The collapse remained in the minds of members for a long time afterwards. Despite occasional rallies, prices dropped steadily, and it was manifest that the World War boom was definitely over. November 1920 was also a month of devastating declines, which produced conditions resembling a panic. The index figure of the 50 stocks fell to 68.85, against 94.07 in April.

In the first 11 months of 1920 transactions in stocks on the New York Stock Exchange showed a considerable reduction in volume from those of the corresponding period in 1919—210,220,428 shares, against 206,822,497. The par value of the shares dealt in was \$17,983,885,573, or about nine billions of dollars less than the year before. Bond transactions, on the other hand, were much larger, increasing from \$2,473,588,050 to \$2,405,821,750 for Government bonds, from \$258,442,500 to \$319,567,400 for state and municipals, and from \$522,315,000 to \$603,527,000 for those of private corporations.

Arbitrage dealings were restored between New York and London at the beginning of Dec., but there was little business of this character. The depreciated paper pound killed the market for American securities in London. Throughout 1920 a growing interest in foreign securities was shown by American investors, and a comparatively large number of foreign Government and municipal obligations were sold in the American security markets. Competition of domestic issues, however, was fierce, and no little difficulty was experienced in inducing the American public

to take up foreign bonds. This had a serious restricting influence on America's export trade, and owing to the inability of Europe to pay for her purchases by exports she had to depend largely on credit given by the United States. In 1921 the depression in trade became very marked, but later a recovery set in.

*Paris.*—Down to 1911 Paris had been a powerful and persistent supporter of the world's money markets, because of the saving habits of the French people, but in the three years prior to the outbreak of war a change had developed. This was particularly noticeable after the Balkan War of 1912 had disturbed the European *bourses*. France had begun early in 1914 to bring money home to meet her own needs. Excessive issues of short-term notes, the disturbances in Mexico, and the collapse of the St. Louis & San Francisco railway in 1913, caused a feeling of revulsion as regards American securities, and Paris, in the year prior to the outbreak of war, was steadily selling them. On the other hand, Germany was increasing her creditor position in the world's markets. The Paris *bourse* witnessed the end in 1911 of a bull campaign which had lasted for several years, and 1912 saw a persistent depression in gilt-edged stocks. The price of French 3% Rentes, which touched 105 in 1893, when Mr. Coehery dreamed of conversion, fell to 87½ in 1912, and with the outbreak of the Balkan War there was a panic.

The *bourse* was reopened after the events of Sept. 1914, on Dec. 7, and thereafter there was a steady rise in prices. After 15 months of war the first war loan was raised. As a necessary preliminary the settlement of the long-deferred end of July 1914 *bourse* account was begun on Sept. 30 1915, and was carried through with comparative ease. The open account had been very largely reduced by gradual sales, and the Bank of France came to the rescue of both Parquet and Coulisse, lending the former about 150 and the latter 35 million francs. The plan of settlement adopted differed considerably from the London Stock Exchange scheme—5% interest was charged from July 1914, to Sept. 1915; holders were asked to pay their differences in full, or were given the option of paying 10% of their differences at the first settlement, and 10% on each subsequent monthly settlement until the balance was wiped off; 6% was fixed as the rate on all unpaid differences; from the make-up prices of the end-Sept. account differences had to be settled at each settlement as before the war. After the first *post-bellum* settlement contingents averaged about 4½ per cent. All new business was for cash, dealing on account being confined to clearing up accounts which existed before Aug. 1 1914.

*Berlin.*—Before the war the Berlin *bourse* was subject to frequent attacks of nerves. On Sept. 4 1911 the *bourse* had what was described as its worst day of the year. It was alarmed by the foreign political situation. Nevertheless business was very active in that year, and the stamp duty on *bourse* transactions produced £75,000 more than in 1910. In 1912 the *bourse* was again much disturbed by political fears, and rumours of war caused heavy selling from time to time. Excessive speculation in the earlier months of 1912 caused the Government Commissary of the *bourse* to issue a public warning. On Oct. 1 of that year came news of the Balkan mobilization, and a panic seized the market. Settlement stocks in one day lost, on an average, 20 points. The total loss in values in that year was estimated at about £150,000,000. On the outbreak of war, Germany imposed more stringent conditions upon the Stock Exchange business than any other country. The open market for stocks and shares was abolished, and the publication of prices was strictly forbidden. Towards the end of 1915, cautious efforts were made, with some success, to liquidate *bourse* transactions which had remained in suspense since the outbreak of war. In 1916 there was much speculation on the German *bourses*, and this was given as a sufficient reason for continuing the veto upon the publication of quotations. But at the end of that year, lists of prices were issued for the first time since July 1914, for the purpose of taxation assessments. The quotations showed many large gains in industrial securities, due, of course, to the enormous profits made by German companies. In 1916 the dividends of 10 explosives manufacturing concerns averaged 22½%, a group of metal companies paid out 20%

on a capital of £9,000,000, and a group of leather companies paid 19% on an average. All the German war loans were, however, listed by special instruction at the price of issue. In 1917 there was again considerable speculation on the *bourses*, with generally rising prices; but the intervention of the United States in the war caused a set-back. At the end of 1917 the listing of prices was resumed, but publication of prices was strictly prohibited. German 3% stock rose 7 to 8 points, and there was a strong demand for industrials. Between Sept. and Dec. 1918 the quotations of German securities on the German markets fell so heavily that German financial writers estimated the decrease in capital value at about 50 per cent. Meanwhile Germany witnessed her foreign credit—such as it was—go to pieces. This was proved not only by the price of the mark, but by an almost universal desire in neutral countries to withdraw outstanding credits to Germany. The index figures prepared by the *Frankfurter Zeitung* showed the following (a. representing values of 24 of the principal shipping, mining and dyeing concerns; b. of 10 important munitions, metal, petroleum and potash concerns.) The table shows the effect of speculation before the German collapse, then a heavy fall, followed by a slight recovery at the end of 1918):—

	July 28 1914	Dec. 31 1917	Aug. 31 1918	Dec. 5 1918	Dec. 31 1918
a.	185	278	272	151	164
b.	232	445	442	177	197½

*Amsterdam.*—The Amsterdam Stock Exchange, which was closed on the outbreak of war in 1914, was reopened on Feb. 9 1915. Business at first was not very extensive, except in shipping and home industrial shares. Foreign stocks were very weak in 1915 owing to persistent selling from Germany. The year 1916 was a record of remarkable fluctuations, and at the close all kinds of shares showed enormous gains. The largest improvement took place in the securities of home industrial concerns, which made huge profits, as the result of the elimination of German competition. The Dutch Indian plantation companies made enormous profits, especially the sugar plantations, which sold a great part of their output to the British Government at high prices. Rubber and tobacco shares also improved in value. Royal Dutch shares were introduced for the first time on the American market in 1916. In 1917 the stock markets were rather quiet. Russian stocks fell enormously in the last months in consequence of the stoppage of interest payments, and the announcement that the Bolshevik Government would cancel the national debt. This latter step could only mean a serious financial disaster for Holland, where Russian stocks had found a ready market as being thoroughly sound investments. The total Dutch ownership of Russian stocks of State as well as private railways was estimated at 1,500,000,000 to 2,000,000,000 florins. New shipping shares amounting to 27,500,000 florins in face value were added to the market in 1917. In the following year the tendency was irregular, and sometimes weak, directly owing to the German collapse, but towards the end of the year prices rose again. Large new issues were made by shipping, plantation, and trading companies.

*Vienna and Budapest.*—In the early years of the war there was extravagant speculation on the Vienna and Budapest *bourses*, and prices rose to extraordinary heights on the enormous profits on paper made by all the industries of the country. But a heavy collapse succeeded the military breakdown in 1918, and the subsequent break-up of the old Empire.

*Switzerland.*—Following the example of the chief foreign *bourses*, the Basle and Zurich Stock Exchanges suspended operations towards the end of July 1914. The Geneva and Lausanne *bourses*, however, remained open even during August. On Jan. 7 1915 the Basle Stock Exchange resumed the publication of its daily price list. A further step forward was taken on Dec. 1 1915, and on April 25 1916 the bond market was reopened in its entirety. On June 26 transactions were extended to the full pre-war list. The Zurich *bourse* restarted official business on May 15 1916. (C. J. M.)

**STOKER, BRAM** (1847–1912), Irish author, was born in Dublin Nov. 8 1847 and was educated at a private school there

and at Trinity College. He entered the Irish civil service, to which his father also belonged, and wrote critical articles for various newspapers. He was called to the English bar, but in 1878 he joined Sir Henry Irving at the Lyceum theatre and was for many years his secretary and finally his biographer. He wrote a number of novels, of which *Dracula* (1897) was the best known, as well as *Personal Reminiscences of Sir Henry Irving* (1906). He died in London April 20 1912.

**STOLYPIN, PETER ARCADEVICH** (1863–1911), Russian statesman, was born in 1863, the son of Admiral Stolypin by his wife, a princess of the house of Gorchakov. He was educated at the university of St. Petersburg, and in 1884 entered the Government service. In 1902 he was appointed governor of Grodno, and in 1905 was transferred to Saratov, where he became known as a firm administrator. In 1906 he was recalled to take up the position of Minister of Internal Affairs, and in July of the same year succeeded Goremykin as Minister President. His career as Premier is described in the article RUSSIA. His firm and repressive policy toward all kinds of sedition caused him to be regarded as a deadly enemy by the revolutionary party, and many attempts upon his life were made. In Aug. 1906 a bomb was exploded at his summer residence, which seriously injured one of his daughters, but all efforts to kill him proved vain until 1911, when he was shot in a theatre at Kiev on Sept. 14, before the eyes of the Imperial family, by a Jew named Mordka Bogrov. The minister died of his wounds Sept. 18 1911.

**STONE, MARCUS** (1840–1921), English painter (see 25-957), died in London March 24 1921.

**STONE, MELVILLE ELIJAH** (1848– ), American journalist, was born at Hudson, Ill., Aug. 22 1848. His father was a Methodist minister, of New York birth, who had moved to Illinois in early life and combined his activities as a circuit-preacher with the running of various small businesses, including book-selling and printing. He had English, Scottish and Irish blood in his veins, the Stone family having settled in New England in the 17th century. In 1860, when Melville was 12, his father was made pastor of a Methodist church in Chicago, and it was there that he got his schooling. In 1864 he began work as a newspaper reporter, but after sundry journalistic experiences he was set up in business in 1868 as proprietor of an iron-foundry and machine-shop, which incidentally made a specialty of the supply of folding theatre-chairs, etc. In the great Chicago fire of 1871 this was destroyed, and Stone was then for some time occupied in the administrative work of municipal relief and reconstruction after the fire. But in 1872 he again took up journalism, as one of the editors of the *Chicago Republican* (subsequently *Inter-Ocean*), and later of the *Post and Mail*, becoming for several years a political correspondent at Washington. At the end of 1875, having returned to Chicago, he and a colleague started a new Chicago paper, the evening *Daily News* (see 19-571), and, after he had obtained the help of a new partner in Victor F. Lawson as its manager, their venture soon became increasingly prosperous. In 1878 he and Lawson bought out the *Post and Mail*, and in 1881 they established the *Morning News* (later *Record* and *Record-Herald*). In 1888 Stone's interest was bought out by Lawson, and he retired, taking a prolonged holiday in Europe. Returning to Chicago in 1891, he took to banking by the foundation of the Globe National Bank, of which he became president, and he kept up this connexion for about ten years; but meanwhile pressure was put on him to take part in the reorganization of the Associated Press, then already a well-known news-agency, and in 1893 he accepted the position of general manager. In this capacity Melville Stone became even more prominent and powerful in the journalistic world than he had been as a Chicago editor and newspaper proprietor. At that time the Associated Press was still struggling (see 19-547) with its competitor, the United Press, but its enterprise now received a new stimulus, and by 1897, under Stone's management, and as subsequently reorganized in 1901, its service knew no rival. Stone had intimate relations with all the leading men of his time and played an important part in the publicity given to events and movements. He held this position until

the close of 1918, when he retired. During that period of 25 years the budget of the Associated Press had grown from \$500,000 to \$6,000,000 and it had come to furnish more than half the news printed in American newspapers.

See the Autobiography: *Fifty Years a Journalist* (1921).

**STOREY, GEORGE ADOLPHUS** (1834–1919), English painter, was born in London Jan. 7 1834. He was partly educated in Paris, but in 1850 returned to England and commenced studying in London at J. M. Leigh's school, subsequently entering the Royal Academy schools. His first picture was hung in 1852. He was in early life a follower of the Pre-Raphaelite school, but gradually changed his style, becoming well known both as a subject painter and for his excellent portraits. He was elected A.R.A. in 1876 and R.A. in 1914. He became teacher of perspective at the Royal Academy in 1900. Among his best-known pictures are "The Old Soldier" (1866); "Christmas Visitors" (1874); "Mischief" (1897) and "The Love-Letter" (1901). Storey published several books, the most important being *Meissner* (1886) and *Theory and Practice of Perspective* (1910). He died at Hampstead July 29 1919.

**STORY-MASKELYNE, MERVYN HERBERT NEVIL** (1823–1911), English mineralogist, was born near Wroughton, Wilts, Sept. 3 1823; he was descended on the mother's side from Nevil Maskelyne, the Astronomer Royal. He was educated at Bruton grammar school and Wadham College, Oxford, and studied for the bar, but in 1850 was invited to deliver lectures at Oxford on minerals, where he stipulated for a chemical laboratory, then a complete novelty in the university. He was prominent in the struggle over the proposal to erect a museum of science and in 1856 became professor of mineralogy with a laboratory in the new museum; but from 1857 he combined the work with the keepership of the minerals at the British Museum and resided in London. In 1880 he resigned this post, but retained his Oxford professorship until 1895. He had inherited a Wiltshire estate from his father, and in 1880 he entered Parliament as Liberal member for Cricklade. In 1885 he was re-elected for N. Wilts as a Liberal Unionist and sat until 1892. He studied especially crystallography, meteorites and gem-stones, and was the author of many scientific papers, and of a book *On the Morphology of Crystals*. He also possessed a valuable collection of antique gems. He died at Bass Down, near Swindon, May 20 1911.

**STOUT, SIR ROBERT** (1844– ), New Zealand judge and statesman, was born on Sept. 28 1844 at Lerwick, Shetland Isles, where he was educated at the parish school and became a pupil teacher. He arrived in New Zealand in 1863, and became second master in the Dunedin grammar school and afterwards in the Dunedin district high school. On July 4 1871 he was admitted as a barrister and solicitor of the Supreme Court of New Zealand, and he then matriculated at Otago University which opened in that month. In 1873 he took first-class honours in mental and moral science and political economy, and from 1874 to 1876 he was Law lecturer at Otago University. Elected a member of the Otago Provincial Council in 1872, he became provincial solicitor in 1873, and he held that position until the abolition of the provinces in 1876. In 1875 he was elected to Parliament as Liberal member for Caversham and in Feb. 1878 he became Attorney-General and Minister of Lands and Minister of Immigration in Sir George Grey's Ministry. But in the following year he resigned owing to the serious illness of his partner, and he did not return to public life till 1884 when he entered Parliament again as member (M.H.R.) for Dunedin East. On the defeat of Sir Harry Atkinson's Government he joined with Sir Jules Vogel in forming a Ministry, which lasted less than a fortnight (Aug. 16–28 1884), but after another Atkinson Government had held office for a few days (Aug. 28–Sept. 3) a second Stout-Vogel Government was formed which lasted three years. In both the Stout-Vogel Governments Sir Robert Stout was Premier and Attorney-General. At the general election in 1887 the Government was defeated and he lost his seat by a narrow margin.

Refusing the offer of other seats, Sir Robert Stout remained out of politics till after the beginning of the long Liberal-Labour régime in 1891. Both by Ballance and by Seddon he was offered a

portfolio but he declined both offers. In June 1893, however, he was elected at a by-election for Inangahua as an Independent Liberal, and at the general elections of 1893 and 1896 he was elected for Wellington City, to which he transferred his residence and his legal practice. In 1898 Sir Robert Stout resigned his seat, and in June 1899 he became Chief Justice.

In politics Sir Robert Stout was a strong Liberal of the individualistic school, devoting special attention to the land and labour questions and to educational and temperance reform. Among his principal measures were the Land Act of 1877, the first Land Tax Act, which he drafted in co-operation with Ballance and which became law in 1878, and the Civil Service Reform Act of 1886, which threw the doors of the service open to women and made examination and competition (the latter being added by the Legislative Council) the tests of all appointments except those of experts. As a member of a Royal Commission appointed in 1881 he helped the late Mr. Allen Holmes in forming the Code of Civil Procedure, which was enacted in the following year and made the Supreme Court Procedure of New Zealand one of the simplest in the world. A life-long abstainer, Sir Robert Stout was always a keen advocate of temperance reform. The local option bills which he introduced in 1876 and 1893 did not get further than their second reading, but the second of these measures forced the hand of the Seddon Government and led to the establishment of local option by a less liberal measure in the same session.

He became a member of the New Zealand University Senate in 1884, and also of the Victoria University College Council, Wellington. In 1903 he was elected chancellor of the university. He was made a K.C.M.G. in 1886. Besides writing many essays and lectures on social, literary and legal subjects, he was the author, jointly with his son, J. Logan Stout, of *New Zealand in the Cambridge University Manuals of Literature and Science*, and of the article on New Zealand in the Oxford University Survey of the British Empire. He married in 1876 Anna Penrhyn, daughter of Mr. J. Logan, official clerk to the Superintendent of the Province of Otago. He had four sons—of whom two served in the war as medical men and one obtained the D.S.O.—and two daughters.

**STRACHAN-DAVIDSON, JAMES LEIGH** (1843–1916), British classical scholar, was born at Byfleet, Surrey, Oct. 22 1843, and educated at Leamington College and Balliol College, Oxford. He graduated first class in *literae humaniores* in 1866, and was elected to a fellowship of his college the same year. This he held until 1907 when, on the resignation of Edward Caird, he was elected to the mastership of the college. His whole life was devoted to university teaching and administration, as classical tutor, examiner, delegate of non-collegiate students, pro-vice-chancellor, etc., and to the study of Roman history. Amongst his published works were *Cicero and the Fall of the Roman Republic* (1894), *Problems of the Roman Criminal Law* (1912), as well as articles on the Roman Constitution in *Smith's Dictionary of Antiquities*. He died at Oxford March 28 1916.

**STRACHEY, JOHN ST. LOE** (1860– ), English journalist, was born at Sutton Court, Som., Feb. 9 1860, the second son of Sir Edward Strachey, 3rd Bart., and Mary Isabella, daughter of John Addington Symonds. He was educated at Balliol College, Oxford, graduating with a first-class in modern history, and was subsequently called to the bar; but he adopted journalism as his profession from the age of twenty-four. In 1886 he became assistant editor of the *Spectator*, and after the death of R. H. Hutton (1897) and the retirement of Meredith Townsend (1898) he became proprietor of the paper, which under his editorship not only maintained but increased the high reputation it had gained (see 19.562) for sober political criticism and well-informed appreciation of art and literature, so that he exercised great influence upon English opinion. St. Loe Strachey also edited (1896–7) the *Cornhill Magazine*. He was specially interested in problems of rural housing, pauperism and local government generally. Amongst his publications are: *The Manufacture of Paupers* (1907); *Problems and Perils of Socialism* (1908); *The Practical Wisdom of the Bible* (1908); *A New Way of Life* (1909).

**STRAIGHT, SIR DOUGLAS** (1844–1914), English lawyer and journalist, was born in London Oct. 22 1844 and was educated

at Harrow. Up to 1865 he engaged in journalism, but was then called to the bar and soon worked up an extensive practice, especially at the Central Criminal Court, London. He sat in the House of Commons as Conservative member for Shrewsbury from 1870 to 1874, and from 1879 to 1892 he was a judge of the High Court of Judicature at Allahabad. He was knighted on retirement, and four years later he returned to journalism as editor of the *Pall Mall Gazette*. He retired in 1909, and died in London June 4 1914.

**STRAITS (DARDANELLES AND BOSPORUS).**—The waterway formed by the Dardanelles, the Sea of Marmora and the Bosphorus, which connects the Mediterranean and the Black Sea, has possessed marked political importance from the earliest times. This importance, however, grew with increasing rapidity during the 20th century. The increase of population, the growth of commerce, the construction of railways, and the rise of nations in the basin of the Black Sea, enormously added to the political and military significance of the Straits. And while these factors gained in weight yearly, the Ottoman Empire, which held the guardianship of the Straits, declined yearly in vigour and strength. Correspondingly, it became more and more the object of national intrigue and ambition on the part of foreign Powers, whose designs would benefit were they in a position to control the Straits themselves.

These matters received forcible illustration during the World War. Problems having their origin in the existence of the Straits became then of supreme importance, even to the extent of prolonging or shortening the period of war. At the Peace Conference, too, questions of the Straits became acute. The seaborne commerce of the 100 million inhabitants occupying the basin of the Black Sea must perforce pass through the Straits. By railway communication with central Asia this region, too, is concerned with control of the Straits. The traditional Russian ambition for a warm water port looked to Constantinople and the Straits for fulfilment; and in 1915 the Powers in alliance with Russia accepted the Russian claim to the great position. Apart from Russia and Turkey, three states—Georgia, Rumania and Bulgaria—had a coast-line confined to the Black Sea, and therefore depend upon the Straits as the one route for their maritime trade with the outer seas. To Germany, control of the Straits in war by her ally Turkey meant the isolation and strangling of her enemies, Russia and Rumania. In fact the closing of the Straits at this time had much to do with the collapse of Russia, the outbreak of the revolution, and the prolongation of the war. With such possibilities and interests hanging upon them, the Peace Conference dealt comprehensively with the Straits in the Treaty of Sèvres. Under this treaty they were thrown open to all navigation in peace and war, without distinction of flag, and blockade of these waters was prohibited. An International "Commission of the Straits" was established to control the waterway. And still further to ensure that military interruption should not take place, a demilitarized "Zone of the Straits" was created, embracing all adjoining coastal territory. Within this area all military works and fortifications were to be razed, and the construction of similar works was forbidden.

(W. J. C. \*)

**STRAITS SETTLEMENTS AND DEPENDENCIES** (see 25,980\*)—The resident pop. of the Straits Settlements proper, according to the census of 1911, was 705,405, divided as follows: Singapore, 303,321; Penang, 141,559; Province Wellesley, 128,978; Malacca, 124,081; the Dindings, 7,466. Males outnumbered females nearly as 2 to 1. Included also in the Government of the Straits Settlements are Labuan (pop. in 1911, 6,546), Christmas Island (1,369) and the Cocos Islands (749).

In Labuan and Cocos Islands males did not greatly outnumber females, but in Christmas Island, with an almost wholly labouring pop., males were 1,328 and females 41.

In 1912 the pop. of the whole colony was estimated at 827,179. That of Christmas I. was 514 on Jan. 1 and 617 on Dec. 31.

In the colony the birth-rate in 1919 was 30.3 per thousand. The death-rate, which was 46.45 per thousand in 1911, fell to 29.15 in 1915, rose, with an epidemic of influenza, to 43.85 in 1918, and was 33.04 in 1919. The principal causes of death in the last year were

infant diseases (5,848) and malaria (4,623), and the other most serious maladies as returned were tuberculosis, beri-beri, pneumonia, and dysentery, but probably many deaths were due primarily to influenza. The epidemic of this disease resulted in the revival, after 30 years, of the native *wang-kang* ceremony at Malacca, in which a model boat is constructed in a temporary temple, and is subsequently burnt as a sacrifice to some supposedly neglected god.

Principal nationalities and religions were shown by the census as follows:—

	Nationalities			
	Chinese	Malay	Indian	Europ. and Amer.
Straits Setts. proper	366,765	235,762	81,928	7,276
Labuan	1,799	4,434	—	31
Christmas I.	1,252	44	—	19
Cocos Is.	—	668	—	39

	Religions			
	Chinese <sup>1</sup>	Mahommedan	Hindu	Christian
Straits Setts. proper	359,760	261,154	52,579	21,474
Labuan	—	4,430	—	110
Christmas I.	—	46	—	32
Cocos Is.	—	669	—	50

<sup>1</sup> Other than Mahommedan and Christian.

Chinese immigrants in 1919 numbered 70,912—21.4% more than in 1918, and 73.6% less than in the "record" year, 1911. Adult males were 62.4% and females 19.5%. 101,433 immigrants arrived at Penang from southern India, and 46,767 Indians quitted the colony. There were 2,439 labourers from Netherlands India.

The Chinese community was on the whole prosperous during the World War; the increased cost of living and the high rate of exchange with China bore hardly upon the poorer classes, but the increase of wages in great measure counterbalanced these disadvantages. The Chinese freely supported patriotic and charitable funds, and after some demur, before its purpose was fully understood, recognized without further difficulty the war-tax ordinance of 1917. The war, however, produced its problems for the community. It was necessary to establish a censorship of Chinese newspapers, and in June 1919 an anti-Japanese boycott resulted in rioting in Singapore and Penang, while a Chinese patriotic league and an anarchical body, the so-called Truth Society, gave some trouble.

**Finance.**—Revenue in 1911 amounted to \$11,409,220, in 1919 to \$34,108,465; expenditure in 1911 to \$9,085,389, in 1919 to \$34,901,233 (\$1 = 2s. 4d.). A noteworthy financial measure was the introduction of an income tax, which, in spite of controversy, raised £400,000 sterling in 1917 without friction.

The colony had at the end of 1919 a debt of £6,913,352 sterling in respect of the loan raised by the issue of 3½% Straits Settlements inscribed stock, 1907. About four-fifths of this loan was expended on account of the Singapore Harbour Board, and the rest on account of the Penang Harbour Board, the municipal commissioners of Singapore and Penang, and on Government harbour works, and interest charges are borne by these bodies.

Among Government monopolies that of opium is by far the most productive; the sales of chandu in the colony in 1919 yielded \$17,511,229, in addition to which there were sales to the Federated and Non-Federated Malay States and Brunei. But prices were raised and other measures were taken in that year with a view to the gradual reduction of the amount of opium consumed.

**Economic conditions: Agriculture, etc.**—In many respects the colony actually benefited from the World War: there was, for instance, an increase in the gross value of trade from £63,600,000 in 1914 to £148,200,000 sterling in 1917. The more serious economic problems were not all results of the war. For example, it was about 1909-10 that a remarkable development of agricultural activity set in, especially in Malacca and Province Wellesley. This took the direction mainly of rubber planting, which led to the neglect of fruit cultivation and other forms of native agriculture; and this tendency has persisted. It has been asserted, indeed, that the rubber industry has been overexploited here: the people ceased in great measure to cultivate their own food crops and raise their own live stock, and became dependent on imported food stuffs. In 1917 rice was imported from Rangoon, Siam, and French Indo-China; wheat flour from Australia and India; cold storage foodstuffs from Australia, and other foodstuffs from China. Difficulties connected with shortage of supplies and shipping made it necessary to set up food control in 1917. An enquiry was instituted into measures for increasing home produce of rice and other foods, and "cultivation clauses" were inserted into leases of newly alienated lands. In 1918 the United States restricted imports of rubber, with a consequent reaction upon the Straits Settlements industry. This could not, however, immediately affect food cultivations, and in that year shortage in India, floods in Siam, and the demand for imported rice in Java and

\* These figures indicate the volume and page number of the previous article.

Japan caused serious conditions in the Straits Settlements. Siam prohibited export of rice in July 1919: the Straits Settlements controller took entire charge of import and wholesale dealing, and a food production department was established which fostered home planting, and in spite of many difficulties it was found possible, early in 1920, to ensure supplies for several months. The Governments of the Straits Settlements, Netherlands India, and Ceylon agreed in 1919 to purchase through a single agent to avoid competition.

The cultivation and yield of coco-nuts declined in and after 1917, and the destruction of palms to make room for rubber had advanced so far in Singapore and Province Wellesley that an enactment was directed against it. Copra prices, however, rose in 1919. The clove, nutmeg, gambier, and areca nut industries of Penang shared in the general decline of cultivations which had become subsidiary to that of rubber. The pineapple cultivation was affected by the difficulty of obtaining tin plate for the canning industry. As for live stock (of which mention has been made above) a report for 1917 showed that whereas in 1910 Malacca exported 12,000 pigs, in the later year that number was imported, and that the former large export of poultry from Penang was more than balanced by import.

**Forestry.**—Measures have been taken to amalgamate the forest services of the Straits Settlements and the Federated Malay States, the first step being taken in 1918, when the forests of Malacca were placed under the deputy conservator of forests for Negri Sembilan. The area of reserved forests in 1920 was 107,270 ac., about 11% of lands in the colony. The mangrove industry has been fostered by imposing a control over cutting, and by replanting, over 2,000,000 seedlings having been planted in Penang and the Dindings in 1919.

**Tin.**—War conditions reacted favourably upon the tin trade. In July 1918 the price reached \$160 per picul, and subsequently \$185 when buying was prohibited except under licence. But after the Armistice the price, already declining, was further lowered when the Imperial Government ceased to buy direct, and the Federated Malay States had to guarantee purchase at \$118 per picul.

**Commerce.**—Imports were valued at £43,856,600 sterling in 1914, and exports at £38,032,000. Both rose annually thereafter almost without exception, until in 1919 the figures were: imports, £96,664,000; exports, £99,318,000. The entrepôt trade in tin and Pará rubber is illustrated by the following figures for 1919:—

Imports (piculs)				
From	Tin	Tin Ore	Rubber	
Malay States	133,000	686,000	1,412,000	
Netherlands India	38,000	113,000	456,000	
Siam	6,000	207,000	—	
Other countries	2,000	32,000	79,000	

Exports				
To	Tin, piculs	Value	Rubber, piculs	Value
United Kingdom	324,000	\$41,347,000	406,000	\$4,088,000
United States	454,000	\$59,928,000	2,310,000	\$230,511,000
Elsewhere	219,000	\$27,445,000	254,000	\$2,227,000

**Shipping.**—The total tonnage of shipping entered and cleared for the year 1919 is shown as follows: Singapore 14,088,775; Penang, 4,009,126; Malacca, 564,409; Christmas I. and Labuan, 222,882. The principal flags were British (nearly five-ninths of the whole), Japanese, and Dutch, and the total increase over the year 1918 was 5,820,913, nearly four-fifths of which was in British shipping. The total of 18,885,183 tons thus compares with 13,064,270 tons for 1918 when the shortage of shipping was most acute, and with 27,124,789 tons in 1913.

Work on the Lagoon wet dock and main wharf reconstruction, Tanjong Pagar, was completed and made over to the Singapore Harbour Board in May 1917. The revenue and expenditure of the Board, which reached \$6,015,648 and \$4,216,015 respectively in 1912, declined to \$5,432,425 and \$3,421,271 in 1915, and amounted to \$9,617,718 and \$5,444,410 in 1918. Penang wharf and dock receipts amounted in 1919 to \$966,372 (approximately), and expenditure to \$815,092. The wharf tonnage returns for Singapore and Penang show the following figures:—

		No. of Vessels	Net Tonnage	Inbound and Outbound	
				Coal, tons	Cargo, tons
Singapore	1913	2,708	5,794,536	1,338,495	1,462,788
	1918	2,114	3,330,791	732,231	1,213,730
Penang	1913	732	1,532,361	282,067	399,412
	1918	513	581,132	60,029	251,183

**Land Communications.**—The Singapore Railway Transfer Ordinance, 1918, enabled the Government of the Federated Malay States to construct a causeway across Johor Straits and to lay a railway to connect the Singapore line with the Johor and Federated Malay States systems. The sale of the Singapore Railway and railway stores involved a sum of \$4,149,750. Metalled roads in the colony at the end of 1919 had a length of 584 m. (Singapore, 96 m.;

Penang and the Dindings, 86 m.; Province Wellesley, 166 m.; Malacca, 231 m.; Labuan, 5 m.), and the Public Works Department had charge, in addition, of 50 m. of gravelled roads in Malacca, and 93 m. of "natural" roads in Penang, the Dindings, and Prov. Wellesley.

**Education.**—The centenary of the modern foundation of Singapore by Sir Stamford Raffles was the occasion of local celebrations in Feb. 1919, and by way of commemoration it was decided to found a Raffles College for higher education. Evidence of the general enthusiasm for this scheme was given by the prompt provision of subscriptions which ensured its success and enabled plans to be laid forthwith. The Straits Settlements Government promised a donation of \$1,000,000 and an annual contribution of \$50,000; the Governments of the Federated Malay States and Johor, and many private individuals, contributed. There have been other signs of a demand for a more active education policy; it being especially desirable as a counter measure against undesirable propaganda.

The Government maintained in 1919 eight English schools, and aided 45 English, Anglo-Tamil, Malay, Tamil, and Chinese schools; it also supported the Malacca Training College for Malay teachers. The Central Training College in Perak, the erection of which was started in that year, is intended for Malay teachers not only in the Federated Malay States but also in the Straits Settlements.

**Labuan.**—Revenue collected in Labuan in 1919 amounted to \$38,308, and expenditure was \$81,927. The total value of trade was \$3,748,930 in that year, and \$2,763,561 in 1918. Merchant shipping entered and cleared amounted to 141,686 tons in 1919. The Labuan Exploration Co. of London undertook a geological survey in 1920 with a view of prospecting for minerals.

**Christmas Island.**—Revenue (1919), \$26,153; expenditure, \$12,791. The export of phosphate of lime, which reached 89,889 tons in 1917, showing a large increase, fell to 53,370 tons in 1918 and amounted to 68,621 tons in 1919. The export was taken in 1919 by Japan (71%) and Australia. Shipping entered and cleared amounted to 81,197 tons (61% Japanese). There is a small export of rubber. The phosphate company maintained its output during the war, completed an inclined haulage way, and carried the railway to new quarries at South Point in 1918-9.

**Cocos Islands.**—A typhoon in 1919 left standing only 3% out of over 1,000,000 coco-nut palms, but replanting was completed in 1911, and export of copra was resumed two years later and reached 800 tons in 1918. An exchange cable station of the Eastern Extension Telegraph Co. and a high-power wireless station are established on Direction Island. The German raider "Emden" landed a party to destroy these on Nov. 9 1914, and was caught and herself destroyed by the "Sydney" of the Australian navy, running ashore on North Keeling Island, while her landing-party captured and escaped in the schooner belonging to the proprietor of the islands.

The governor of the Straits Settlements is high commissioner for the Malay States, Federated and Non-Federated (see MALAY STATES), and also for Brunei, and British agent for Sarawak and British North Borneo. These three divisions of northern Borneo are dealt with below.

**Brunei** (see 4.681).—Pop. (1911), 21,718. Revenue (1919), \$162,020; expenditure, \$138,844. Imports were valued in 1916 at \$254,756, and \$614,061 in 1919; exports at \$734,254 in 1916 and \$1,134,864 in 1919, including plantation rubber (\$243,596), cutch (\$304,249), and coal (\$296,621). The demand for sago, wild rubber (jelutong) and other forest produce, and dried fish, was great, and purchase prices ceased to be controlled by a group of traders as previously, which enabled the peasantry to profit to the extent of balancing the high prices of rice and other foodstuffs. Attempts were made to increase home production. The rice crop of 1918-9 failed, but the effort was maintained and rewarded in the following season. Plantation rubber (429,823 lb.) came mainly from the Brunei district, which has become the chief centre of the industry, in place of the Tembung basin. The cutch industry was suffering from the former indiscriminate cutting of mangroves in accessible districts where no replanting had been done, and the production was only maintained at the expense of heavier labour and transport. The Brooketon collieries yielded 29,565 tons of coal in 1918 and 26,274 tons in 1919. Attempts to develop a petroleum field at Tutong at this period were unsuccessful, though it was still expected that later there would be good results. Plantations and mines were encountering a serious shortage of labour, owing to the prosperity of the native traffic in forest produce, etc., above referred to.

**Sarawak** (see 24.207).—Pop. (estimated 1919), 600,000. Revenue (1918), \$1,921,964; expenditure, \$1,455,692. Imports, \$9,908,732; exports, \$11,540,190. Gold was exported to the value of \$1,256,590 in 1915 and \$923,100 in 1918. An extensive oil-field has been developed in Baram district, and 74,400 tons of oil were exported in 1918. Other principal exports include sago, pepper, and jelutong. There are four wireless stations, affording communication with Singapore. Charles Vyner Brooke (b. 1874) succeeded his father, Sir Charles Johnson Brooke, as rajah on May 17 1917.

**British North Borneo** (see 4.262).—Pop. (1911), 208,183; (estimated 1919), 227,000. The revenue of the British North Borneo Chartered Company (exclusive of land sales) has shown unbroken increase since 1910, from £170,767 in that year to £234,804 in 1914

and £373,936 in 1919; expenditure for 1919 amounted to £193,230. Imports were valued in 1919 at £225,235, and exports at £1,453,999, including rubber (£782,037), tobacco (mostly grown on estates; £230,122), coal (£78,706), copra (£39,629), cutch (£24,651), sago, and dried fish. The company's railway from Jesselton extends to Melalap in the interior, and has a branch from Besufort to Weston, and a total length of 130 miles. There are four wireless stations. A Legislative Council was established in 1911 to aid the governor and civil staff in the local administration: the commercial, planting, Chinese, and native communities are represented on it. The company created an opium monopoly department in 1913, following the policy of the Straits Settlements Government. (O. J. R. H.)

**STRANG, WILLIAM** (1859-1921), British painter-etcher (see 25.982), was in 1918 elected president of the International Society of Sculptors, Painters and Gravers. In 1909 the degree of LL.D. was conferred upon him by Glasgow University. His later work includes the etchings "The Little Flower Girl" (1909); "Nymph and Shepherds" (1910); "On the Omnibus" (1911); "The Walls of the Alhambra" (1912) and "The Mirror" (1912); besides various portraits, including one of Thomas Hardy (1910). He had only recently been elected a full R.A. when he died suddenly at Bournemouth, on April 12 1921.

See *Catalogue of William Strang's Etched Work, 1882-1912* (1912).

**STRATEGY:** see TACTICS.

**STRATHCONA AND MOUNT ROYAL, DONALD ALEXANDER SMITH, 1ST BARON** (1820-1914), Canadian statesman (see 25.1000), died in London Jan. 21 1914. His barony passed by special remainder to his daughter Margaret Charlotte, wife of Robert Jared Bliss Howard, of Montreal (d. 1921).

**STRAUSS, RICHARD** (1864- ), German composer (see 25.1003). His opera, *Ariadne auf Naxos* (1912), was produced at His Majesty's theatre by Thomas Beecham in May 1913 and the same year *Der Rosenkavalier*, first produced at Dresden in 1910, was performed at Covent Garden with great success, eight performances being given; in point of fact, this proved to be Strauss's most popular opera. His other recent works include *Festliches Præcludium*, for orchestra (1913), and *Josephs Legende* (1914). In addition to the works enumerated mention should be made of *Eine Alpensinfonie*, (1915, op. 64); and the three-act opera, *Die Frau ohne Schatten*, libretto by Hugo von Hofmannsthal (1916, op. 65). In the winter of 1920-1 Strauss visited S. America, where he officiated at Buenos Aires as opera conductor, subsequently returning to Vienna.

**STRAVINSKY, IGOR** (1882- ), Russian musical composer, was born at Oranienbaum, near St. Petersburg, June 18 (O.S. June 5) 1882. His father was an opera singer, who early discovered his son's remarkable musical gifts. At the same time, however, he wished the boy not to devote himself entirely to music but to study law, and with this end in view Igor Stravinsky entered the University of St. Petersburg. At the age of 22, however, a meeting with Rimsky-Korsakov decided him in the direction of a musical career, and the former declared himself ready to take Stravinsky as a pupil. His first work for orchestra was a symphony (1907), followed by a suite, *Faune et Bergère*, and two short works, also for orchestra, *Feu d'artifice* and *Scherzo fantastique*. A meeting with Serge Diaghilev turned his attention to the possibilities of the ballet, and in rapid succession appeared *L'Oiseau de feu* (1910), *Petrouchka* (1911), and *Le Sacre du Printemps* (1913). His next important work was an opera, *Le Rossignol* (1914), founded on Hans Andersen's fairy story of *The Nightingale*, of which the second and third acts were later worked up into a symphonic poem, *Le Chant du Rossignol* (1917). The opera was produced at Covent Garden in 1920, and the same year appeared a revision by Stravinsky of Pergolesi's *Pulcinella*.

**STREUELS, STIJN**, the pen-name of FRANK LATEUR (1871- ), Flemish author, who was born at Heule, West Flanders, Oct. 4 1871. He was a nephew of Guido Gezelle (1830-1899), a celebrated Flemish poet, and until 1905 worked as a baker at Avelghem, a village near Courtrai in West Flanders. Writing in the West Flemish dialect, he was accepted in Belgium and Holland as the most distinguished Low Dutch author of his day. He produced many short stories, including *Openlucht* (1905) and *De Vlaschaard* (1908), a collection of which, trans-

lated into English by A. Teixeira de Mattos, appeared in 1915 under the title of *The Path of Life*. In 1912 appeared *Het glorierijke Licht* ("The Glorious Light").

**STRIKES AND LOCK-OUTS** (see 25.1024).—In the following account of later developments between 1907 and 1921, strikes in the United Kingdom are first dealt with, sections following for other countries.

#### (A) UNITED KINGDOM

**I. Statistics.**—Table 1 shows the total number of strikes or lock-outs recorded in each year from 1907 to 1920, inclusive; the number of workpeople involved therein, and the aggregate loss of working days due to these disputes.

Table 1.

	No. of Disputes	No. of Work-people Directly and Indirectly Involved	Aggregate Duration of Disputes in Working Days
1907	601	147,000	2,162,000
1908	399	296,000	10,834,000
1909	436	301,000	2,774,000
1910	531	515,000	9,895,000
1911	903	962,000	10,320,000
1912	857	1,463,000	40,915,000
1913	1,497	689,000	11,631,000
1914	999	449,000	10,111,000
1915	707	453,000	3,040,000
1916	578	281,000	2,581,000
1917	803	885,000	5,809,000
1918	1,300	1,142,000	6,332,000
1919	1,413	2,515,000	34,903,000
1920	1,715	1,932,000	27,011,000

It will be seen that the figures show a general advancing tendency, partially checked during the World War. The total for the year 1920 shows the highest figure ever recorded for number of disputes, the highest figure (with one exception) for the number of workpeople involved, and the highest figure (with three exceptions) for the aggregate duration of disputes. The exceptions in this latter case are 1893, with 30,468,000 working days; 1912, with 40,915,000 working days; and 1919, with 34,903,000 working days. In 1893, 1912 and 1920 the high figures were principally due to great coal strikes; the year 1919 was a year of great industrial unrest.

As showing the general advancing tendency of the figures, it may be instructive to compare the average of the four years 1907-10 with the average of the four years 1917-20:—

	Average of Years 1907-10	Average of Years 1917-20
No. of Disputes . . . . .	492	1,308
No. of Workpeople Involved . . . . .	315,000	1,633,500
Aggregate Duration (in Working Days) . . . . .	6,416,000	18,511,000

It should be stated that the increase in the number of disputes may be partly accounted for by improved facilities for obtaining information with regard to minor disputes, which may have previously escaped notice; but this will not account for more than an insignificant part of the increase in the figures for number of workpeople involved and for aggregate duration, since the greater disputes, involving large numbers of workpeople, have always been well reported in the newspapers. Table 2 (p. 583) shows the distribution of strikes between the principal groups of trades, taking the averages for the 10 years 1911-20.

Table 2 shows that the average number of workpeople involved in each dispute was a little over 1,000, and that the average duration of disputes was about 14 days. The figures, however, vary widely as between one trade and another. Thus, the average number of workpeople varies from a little more than 200, in the building trades, to over 3,000 in the mining and quarrying group; while the average duration varies from 8 days, in the transport trades, to 27 days in the building trades.

The figure for average numbers involved, and still more that for the average duration, give an exaggerated idea of what may be called the "normal" magnitude and duration of a strike. It is the great strikes, involving many thousands of workpeople, that are commonly also the hardest fought and the most prolonged. Great

masses of workers are not mobilized for industrial conflict except for some object which they regard as first-class importance; and it is exceptional for a strike or lock-out of this magnitude to occur unless all means of reaching a pacific settlement have been exhausted, and unless both employers and workpeople are organized in strong combinations, with great financial resources. All these factors tend to prolong precisely those strikes—in reality a small minority—which involve large numbers of workpeople, and thus exaggerate enormously the figure for "aggregate duration." For example, nearly 40% of the aggregate duration of disputes in the building trades was due to the great dispute in the London building trade in 1914, which lasted for more than six months and accounted for about 2,500,000 working days. In the mining and quarrying industry, two-thirds of the total aggregate duration of all the disputes was due to the two great coal strikes of 1912 and of 1920; if these were eliminated, the average number involved in disputes in this group of trades would be reduced from over 3,000 to 1,800, and the average duration from 14 to 8 days. The case is much the same with the other great groups of trades; and, speaking broadly, it may be said that the vast majority of recorded disputes involve comparatively small numbers of workpeople, and last less than a fortnight—often indeed, only a few days.

To put the same thing in another way. The number of disputes which had an aggregate duration of 25,000 days and upwards varied, in the period 1904-13, from 11 (in 1904) to 72 (in 1913), with an average of 32, or 5% of the total number of disputes. Yet this 5% of disputes accounted for 65% of the number of workpeople involved, and for no less than 86% of the aggregate duration.

Or again, the number of disputes in which 2,500 workpeople or upwards were involved varied, in the years 1904-13, from a minimum of 4 (in 1905 and in 1907) to a maximum of 43 (in 1913), with an average of 18, or less than 3% of the total number of disputes; but this 3% of disputes accounted for 67% of the total number of workpeople involved, and for 74% of the aggregate duration.

Some trades are far more subject to industrial disturbance than others; in the building trades the proportion of men who strike or are locked out rarely reaches 1% of the total number employed in the industry, and in the clothing trades the proportion is not much higher; whereas in the coal-mining industry the proportion who strike or are locked out rarely falls below 5% and frequently rises above 20% in a year.

The mean percentages of workpeople involved in disputes for the years 1904-13 were as follows:—

Building trades	0.7
Coal mining	21.4
Other mining and quarrying	2.2
Metal engineering and shipbuilding	3.3
Textile trades	6.4
Clothing trades	1.3
Other trades	1.7
All Trades	4.4

The statistics of *causes* show, on the whole, remarkable regularity. Such fluctuations, as there are, are due principally to the prevalence or otherwise of wage disputes. In years of good or improving trade, strikes for advances in wages are numerous; in years of bad and declining trade such strikes become much fewer.

The statistics of *results* show somewhat less regularity. The principal features of this part of the table are the diminishing proportion of disputes settled in favour of the employers, and the

Table 2.

Group of Trades	No. of Disputes	No. of Workpeople involved (Thousands)	Aggregate Duration in Working Days (Thousands of Working Days)
Building	119	25	652
Mining and Quarrying	164	508	7,067
Metal Engineering and Shipbuilding	265	180	2,765
Textile	107	138	2,143
Clothing	58	19	258
Transport	88	150	1,230
Miscellaneous (including Employees of Public Authorities)	260	68	968
Average for all above Trades <sup>1</sup>	1,061	1,088	15,083

<sup>1</sup> Exclusive of the general strike at Dublin in 1913-4, which cannot be classified under any of the separate trade headings. This strike involved about 20,000 workpeople, and had an aggregate duration of 1,900,000 working days.

increasing proportion settled by a compromise. In the first half of the period the proportion of disputes settled in favour of the workpeople was 24% on the average; settled in favour of the employers, 44%; and compromised, or partially successful, 32%. In the second half of the period the corresponding percentages were 26, 28, and 46. It should be noted that the second period includes three or four years of exceptional prosperity, a condition which tends to promote settlements in favour of the workpeople; and that this was followed by the period of the war, when prices were constantly rising and industrial conditions were altogether abnormal.

Table 3 classifies the disputes of the years 1900 to 1920, (a) according to their causes, and (b) according to their results:—

Table 3.

Year in which Disputes began	Proportion of Disputes arising on questions of					Proportion of Disputes settled				
	Wages	Hours of Labour	Employment of particular Classes or Persons.	Other Questions	Total	In favour of Workpeople	In favour of Employers	Compromised	Indefinite or Unsettled	Total
	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.
1900	68	1	14	17	100	31	34	34	1	100
1901	63	4	13	20	100	26	44	30	..	100
1902	60	5	13	22	100	24	47	28	1	100
1903	60	4	14	22	100	23	48	29	..	100
1904	65	4	13	18	100	15	51	32	..	100

II. *Principal Disputes*.—The year 1908 (in contrast to 1907, which was entirely free from any disputes on a great scale) saw three great disputes: (1) a shipbuilding dispute involving 35,000 workpeople, and with an aggregate duration of 1,719,000 working days; (2) an engineering dispute on the N.E. coast, involving 11,000 workpeople, and with an aggregate duration of 1,706,000 working days; and (3) a dispute in the cotton trade, involving 120,000 workpeople, and with an aggregate duration of 4,830,000 working days.

In each of these three disputes the workpeople struck against (or were locked out to enforce) a proposal to reduce wages. This was at one time a common and important cause of disputes; the great coal strike of 1893, for example, was against a reduction in wages. During 1910-20 there were few or no disputes of any importance on this ground; in fact, these three disputes in 1908 were the last important disputes arising out of an attempt to reduce wages, until the ship-joiners' dispute, which, beginning in Dec. 1920, was the precursor of a series of strikes or lock-outs culminating in the coal strike of 1921.

In each of the three disputes referred to above, one or more of the trade unions concerned was prepared, before the strike or lock-out occurred, to accept the terms offered by the employers; but in each case one or more other trade unions resisted the reduction. Modified terms offered by the employers were accepted in all three cases.

There were no important disputes in 1909; but in 1910 several prolonged disputes, involving large numbers took place.

Trouble arose in Northumberland and Durham in Jan. 1910, with regard to the working of the coal mines under the Eight Hours Act (the Coal Mines Regulation Act, 1908), which came into operation, in those two counties, on Jan. 1 1910. Agreements had been reached between the two coal owners' associations and the respective miners' union in Dec. 1909, as to the working of the mines under the new arrangements; but a large number of men at the various mines repudiated the agreements, and refused to go down the pits. About 85,000 workpeople were involved in Durham, and about 30,000 in Northumberland. At most of the pits the strike was over by the end of Jan.; but a minority of men stood out, and the strike was not finally settled until April. The aggregate duration of the dispute was about 1,280,000 working days in Durham and about 1,080,000 working days in Northumberland.

Certain members of the United Society of Boilermakers and Iron and Steel Shipbuilders stopped work in Aug. 1910, in breach of an agreement with the Shipbuilding Employers' Federation, at two shipyards, one on the Tyne and the other on the Clyde; and the Employers' Federation locked out the members of the Boilermakers' Society at all the federated shipyards on Sept. 3. About 25,000 workpeople were directly or indirectly affected.

A provisional agreement made between representatives of the parties on Oct. 11 1910, was twice rejected by the workpeople on a ballot vote, and it was not until Dec. that a final agreement supplementing that of March 1909 was reached, and accepted by the workers. Work was resumed on Dec. 15. The aggregate loss of time in this dispute was about 2,850,000 working days.

A strike of *coal miners and surface workers* in the Rhondda Valley began on Sept. 1 1910 and continued for nearly a year, being settled in Aug. 1911. It arose out of a dispute at one pit concerning the price list for a particular seam, and was followed by sympathetic strikes at other pits belonging to the same employers. An agreement was finally reached on the price list, and on a guarantee of an average wage. About 12,800 men and boys were involved at the beginning of the strike.

The years 1911-2-3 were years of violent, and almost continuous industrial unrest. Among the most important disputes of these years were those described below.

A series of *seamen's and transport workers' strikes* began in June 1911. The original occasion of the first dispute was a demand put forward by the National Sailors' and Firemen's Union for the formation of a conciliation board, consisting of representatives of the Union and of the Shipping Federation, to consider a programme of reforms desired by the Union. The Federation refused to discuss the demands, and the seamen and firemen came out on strike at various dates in June 1911, many of the principal ports being affected. (London was not affected till a little later.) Strikes of dock labourers, carters, tramway-men, and other transport workers occurred at some of these ports, partly in sympathy with the seamen, and partly in support of demands of their own for improved working conditions. Serious disorder occurred at Hull, Manchester and Salford.

Settlements were reached at various dates in July and Aug. affecting seamen and dockers at Hull and Goole; seamen and carters at Manchester; dock labourers and tramwaymen at Liverpool; and seamen and transport and other workers at Cardiff. There were also a large number of sectional settlements in the London dock, shipping, and transport trades.

The *railway dispute* of 1911 began with a strike of 1,000 railwaymen (goods porters, etc.) at Liverpool on Aug. 5, the men alleging their inability to get their grievances dealt with by the conciliation boards set up under the scheme of 1907. They were joined by railwaymen at Manchester and at many other centres. On Aug. 15 the executives of four of the railwaymen's trade unions sent to the various railway companies a resolution, stating that they were being pressed by their members to declare a strike, and giving the companies 24 hours to decide whether they would immediately meet representatives of the workers to discuss their grievances. The Government

got into touch with representatives of the companies and of the trade unions on Aug. 16; and on the following day the Prime Minister announced that the Government was prepared to appoint immediately a Royal Commission, to investigate the working of the Railway Conciliation Agreement, and to report what amendments, if any, were desirable in the scheme. This announcement did not prevent a strike; but a provisional settlement was reached on Aug. 19, and work was generally resumed on Aug. 21 (except on one railway, where it was resumed on Aug. 23). The Royal Commission began its sittings on Aug. 23, and reported on Oct. 18. The trade unions, however, refused to accept the Commission's recommendations without various modifications; the railway companies, on their side, took the line that both sides were bound by the findings of the Commission. On Nov. 22 the House of Commons debated the question, and passed a resolution to the effect that the parties should be invited to meet with the view of discussing the best mode of giving effect to the report of the Royal Commission. The Board of Trade signified to the parties their readiness to call a fresh conference "on the understanding that the findings of the Royal Commission were accepted in principle and in substance." The parties accepted these conditions, and a conference was held, at which an agreement was reached, the recommendations of the Royal Commission being accepted with certain alterations and additions. The effect of the new agreement was to expedite the settlement by the conciliation boards' of matters in dispute, to secure greater uniformity in the decisions of the conciliation boards, and to give such decisions greater finality than they had previously possessed.

The Cotton Weavers' Association of N. and N.E. Lancashire engaged in an active campaign in this year (1911) against the employment of non-unionists. The employers replied by a general lock-out, which began on Dec. 28, about 160,000 workpeople being involved. This is exclusive of the workpeople in the spinning section of the trade, who were put on short time, or thrown out of work, owing to the stoppage of the principal outlet for their production. The chief industrial commissioner (Sir George Askwith) invited the parties to a conference, which was duly held; and an agreement was reached on Jan. 19 1912. Work was to be resumed on Jan. 22, under the old conditions of employment, on the understanding that no action should be taken for six months in the way of tendering notices or striking mills on the non-unionist question. It was also agreed that, at the end of that period, Sir George Askwith would, if requested, submit proposals for the settlement of the question.

The great *coal strike* of 1912 involved an aggregate loss of working time of over 30,000,000 working days in the coal mines alone. There was also, of course, much consequential unemployment and under-employment in other industries. The percentage unemployed among members of trade unions rose to 11.3% at the end of March 1912; while blast furnaces, steel sheet works, and the glass bottle industry, were brought almost to a standstill, and tinplate mills working were reduced to about 14% of the normal number.

The strike arose out of a demand by the Miners' Federation for the payment of a minimum wage for every man and boy working underground in the mines. A conference between representatives of the coal-owners and of the miners had discussed the question of the earnings of miners in "abnormal" places (i.e. in working places where, owing to the thinness of the seams, or other causes beyond their control, the hewers were unable to earn the recognized minimum or average rate for the district), and a considerable measure of agreement had been reached; but at the annual conference of the Miners' Federation at Southport on Oct. 6 1911, it was decided "to take immediate steps to secure an individual district minimum wage for all men and boys working in mines in the area of the Federation, without any reference to the working places being abnormal."

A ballot of the members of the Federation was taken on the question of handing in notices to establish the principle of an individual minimum wage, as expressed in the resolution quoted above. There was a large majority (445,801 to 115,721) in favour

of giving notice; and notices were accordingly handed in, to terminate at the end of Feb.

At a subsequent meeting the Miners' Federation fixed the minimum rates they were prepared to accept in each district for piece workers "at the face" (*i.e.* hewers, etc.); and also added the following general instructions to their representatives, for their guidance in any negotiations that might ensue with the mine owners:—

"No underground adult worker should receive a rate of wages less than 5s. per shift." (This did not apply to the Forest of Dean, or to Bristol and Somerset.) "Individual minimum wages for all piece workers other than colliers to be arranged by the districts themselves, and to be as near as possible present wages."

Day rates for underground workers, and boys' wages, were also to be left to local arrangement; the boys' wages not to be less than the then existing wages, and not in any case less than 2s. a day.

Unsuccessful negotiations took place between the coal owners and the men; and on Feb. 20 Mr. Asquith, who was at that time Prime Minister, intervened, and invited both parties to meet him and other members of the Government, separately, in conference on Feb. 22. From that date onward till March 15 the Prime Minister kept in constant touch with the parties, who finally met, in joint session, with representatives of the Government, on March 12, 13 and 14. On March 15, the Prime Minister announced that the Government had decided to ask from Parliament "a legislative declaration that a reasonable minimum wage, accompanied by adequate safeguards for the protection of the employer, should be a statutory term of the contract of employment of people who are engaged underground in coal mining."

In accordance with this announcement the Prime Minister introduced a bill in the House of Commons on March 19 1912, which received the Royal Assent on March 29, as the "Coal Mines (Minimum Wage) Act, 1912." The Act provided for the setting up of a joint district board in each of 22 districts specified in a schedule to the Act, to determine the minimum rates of wages for workmen employed underground in coal mines. On March 27 the coal owners met and adopted a resolution in favour of working the Act; and on the same day the men's Federation decided to take a ballot of the members on the question of resuming work, pending the settlement of minimum rates by the district boards. The ballot showed a majority (244,011 to 201,013) against resumption; but, at a national conference held on April 6, it was decided to terminate the strike.

A great strike of dock and other transport workers in the Port of London and on the Medway began on May 21 1912, and lasted over two months. The immediate occasion of the dispute was the refusal of a workman who belonged to the Amalgamated Society of Foremen Lightermen to join the Amalgamated Society of Watermen, Lightermen, and Bargemen; the latter society is affiliated to the National Transport Workers' Federation, but the former is not. The employers refused to interfere, and between 5,000 and 6,000 lightermen left work on May 21, followed later by a number of dock workers, who ceased work in sympathy.

The underlying cause of the dispute, however, was dissatisfaction with the carrying out of the various agreements that had been arrived at in settlement of the disputes in the previous year (*see above*). The Government ordered an enquiry to be held by Sir Edward Clarke, K.C.; and the alleged grievances of the workmen were found to come under seven heads, including:—

Employment of non-union men, in alleged breach of an agreement, by two of the employers' associations.

Refusal of an employers' association to meet the trade union to discuss rates of wages and conditions of labour.

Refusal of certain employers to pay rates of wages fixed by various awards or agreements. Alleged interference with union workmen.

The board of trade invited representatives of the employers and of the workers to a conference, to discuss Sir E. Clarke's report. The men accepted, but the employers declined to be present, and stated that they could not accept Sir E. Clarke's report as an award on the points dealt with by him. They were unable to adopt certain suggestions made by the Board of Trade for the formation of a federation of employers; and refused, "under any circumstances, to any recognition of the Union of

Transport Workers' Federation ticket, or any discussion for such recognition." Following upon debates in the House of Commons, and upon further conferences with the parties, the Government put forward various proposals on June 7; these were accepted (in substance) by the men, but refused by the employers. The Transport Workers' Federation thereupon declared a national strike of transport workers. Certain of the unions affiliated to the Federation took a ballot of their members as to the advisability of ceasing work, the result being in each case a majority against a strike; and only about 20,000 men, at Manchester and some of the minor ports, came out on strike. These all returned unconditionally after a few days' stoppage.

The places of the men on strike in London had by this time begun to be filled up by non-unionists; and the employers took a very determined attitude, refusing to agree to any conditions precedent to the men returning to work. Further negotiations were fruitless, and on July 27 the men's strike committee recommended an immediate resumption of work. By July 31 the return to work was fairly general; and by Monday, Aug. 6, practically all the men who could find work were reinstated. About 100,000 workpeople were involved in the dispute, and the aggregate duration was about 2,700,000 working days.

A strike of tube and other metal workers in Birmingham, Wolverhampton, Wednesbury, and other towns in the "Black Country," began on April 25 1913, and continued until the middle of July. As many as 50,000 workpeople were involved at the height of the dispute, and the aggregate duration was about 1,400,000 working days. The majority of the strikers were labourers or semi-skilled workers; but a large number of skilled men were thrown idle owing to the absence of the labourers. The men demanded an all-round advance of 2s. a week on day-rates, and 10% on piece-rates, with a standard minimum of 23s. a week for unskilled men; and various rates, on a scale rising with each year of age, for youths and for girls. The parties were brought together through the intervention of the chief industrial commissioner; and an agreement was signed on July 7, fixing the standard rate for adult able-bodied unskilled labourers at 23s. in the Birmingham district, and at 22s. in the Black Country district, to be raised to 23s. after six months. The rates for youths and for girls were also fixed, on a scale rising by ages. Piece-work rates were to be fixed by agreement between the several employers and their workmen, the day-rate, however, being guaranteed irrespective of piece-work earnings.

The Dublin dispute of 1913-4 was unique in British industrial history, in that it was the only dispute of importance, at least since regular records have been compiled, in which all the trades of a whole city and district were involved, including even agriculture. It was, in fact, the nearest approach to a "general" strike that had ever been known. Ever since the year 1908 there had been much industrial unrest in Dublin, frequently taking the form of the sympathetic strike. The "sympathetic" strike, in this developed and organized form, is a species of boycott, aiming at the complete dislocation of the trade of the firm or firms attacked; the withdrawal of their own employees is supplemented and reinforced by the refusal of the employees of other firms to handle their goods. The immediate occasion of the strike was an announcement by the Dublin Tramway Co. of the temporary closing of their parcels department, and of their intention, when that department was reopened, not to allow their employees in that department to belong to the Irish Transport and General Workers' Union, which had been active in the policy of the sympathetic strike. A number of tramwaymen struck work on Aug. 26, demanding the reinstatement of the locked-out workpeople in the parcels department; they also put in claims for increased wages, shorter hours, and other concessions. Following this came strikes (or lock-outs) of employees of flour millers, coach builders, biscuit manufacturers, coal merchants, steamship companies, master carriers, master builders, timber importers, cement and brick merchants, and farmers in the County Dublin; besides a large number of independent firms, in a wide variety of trades. At a meeting on Sept. 3, 400 employers in Dublin passed a resolution to the effect that "the

position created by the Irish Transport and General Workers' Union (a union in name only) was a menace to all trade organizations, and had become intolerable"; and pledging themselves not to employ members of that Union, or any persons refusing to carry out his employer's lawful and reasonable instructions. A large number of employers endeavoured to require their workpeople to sign an undertaking in the following terms:—

"I hereby undertake to carry out all instructions given to me by or on behalf of my employers, and, further, I agree to immediately resign my membership of the Irish Transport and General Workers' Union (if a member), and I further undertake that I will not join in any way support this Union."

On Sept. 26 it was announced that a Court of Enquiry had been appointed, consisting of Sir George Askwith, Sir Thomas Ratcliffe Ellis, and Mr. J. R. Clynes, to inquire into the dispute, and to take such steps as might seem desirable with the view of arriving at a settlement. The Court of Enquiry heard evidence at Dublin on Sept. 29 and on Oct. 1-4, and issued their report on Oct. 6. The report (1) regretted that no steps had been taken to set up Conciliation Boards, as had been several times suggested; (2) reported that there were indications that substantial grievances existed in the various industries; (3) condemned the policy of the sympathetic strike; "no community," it declared, "could exist if resort to the sympathetic strike became the general policy of Trade Unionism"; and (4) condemned the undertaking which the employers had endeavoured to impose on the workpeople, as contrary to individual liberty, and such as no workman or body of workmen could reasonably be expected to accept. The report also made proposals for the settlement of the dispute, based on the establishment of a series of conciliation committees. These proposals were accepted by the workers but rejected by the employers, who declared that they could not recognize the Irish Transport and General Workers' Union, until it was reorganized on proper lines, with new officials approved by the British Joint Labour Board.

Various other efforts were made to settle the dispute, notably by the Joint Board (the "British Joint Labour Board," already referred to). This was a composite body representing the parliamentary committee of the Trades Union Congress, the Executive Committee of the General Federation of Trade Unions, and the Executive of the Labour party. These overtures came very near to success, the parties being brought together in joint conference; but the negotiations broke down, on Dec. 20 1913, on the question of reinstatement. All this time the employers had been gradually replacing the men on strike or locked out; and a few of the men who had struck (or been locked out) had returned to work. During Jan. and the early part of Feb., the majority of the remaining strikers whose places were still open returned to work, most of them agreeing to handle all goods and to obey orders. In some cases the men also undertook not to belong to the Transport Union.

The principal dispute of 1914 was in the London building trade. Numerous strikes had occurred against the employment of non-unionists, although most of the trade unions were bound by agreements which contained (*inter alia*) a stipulation that there should be no discrimination between union and non-union labour. At a conference with eight of these trade unions, held on Dec. 23 1913, the employers put forward certain proposals for enforcing these agreements by means of penalties; these proposals were rejected by the trade unions, and on Jan. 7 1914, the London Master Builders' association gave notice that they regarded the working-rule agreements as no longer in force. The employers next endeavoured to impose on the workpeople an individual undertaking to work peacefully with non-unionists, on pain of a penalty of twenty shillings. Most of the men refused to sign the undertaking, and the strike began on Jan. 26 1914. Various efforts were made to settle the dispute; but proposals which had been agreed to by the men's representatives were twice rejected by the trade unions on a ballot vote. One of the smaller unions, however, accepted the terms at the second vote, and came to a sectional agreement; and sectional agreements were afterwards made with two other trades. At this point the National Federation of Building Trade Employers resolved on a lock-out of all

their employees throughout the country, if the dispute were not settled by Aug. 15. Before the threat could be carried out, however, the World War had begun; and a settlement was hastily reached, on the basis of the acceptance by the men of the terms last offered by the employers, with certain modifications. The chief points in the settlement were:—

Employers to be at liberty to employ any man, but unions to have right of appeal against any operative who has made himself specially objectionable to his fellows. Ticket inspection granted, but not during working hours. National executives of unions to guarantee observance of rules. Six months' notice to be given for termination or modification of rules.

There was a strike of coal miners in Yorkshire, lasting from the middle of Feb. to nearly the end of April 1914, in which about 150,000 workpeople were at one time involved. The employers at certain collieries had refused to add the usual percentages to the newly established district minimum rates; and it was finally decided that a lower minimum should be fixed for certain collieries, and the percentages above standard calculated on these reduced minima.

The outbreak of the World War brought all the important current disputes to an end; and, though there were a large number of disputes in the remaining months of 1914, and indeed during the whole period of the war, most of them were quite unimportant, and were brought to a very speedy conclusion. After the passing of the first Munitions Act in 1915 many of these strikes were illegal; and, even when they were not illegal, they were sometimes unauthorized by the central executives of the respective trade unions. The fact that the dispute was illegal or unauthorized; the swift intervention of the Government, armed with emergency powers; and—perhaps more important than all these—the severe reprobation of strikes by public opinion, tended to restrict their scope and above all to shorten their duration. Hence the aggregate duration even of some of the disputes that excited most public feeling, such as the Clyde Engineering dispute of Feb. and March 1915 (about 110,000 working days) was quite trivial by comparison with the great disputes before the war.

On Feb. 4 1915, the Government appointed Sir George Askwith, Sir Francis Hopwood, and Sir George Gibb, as a "Committee on Production in Engineering and Shipbuilding Establishments," to enquire and report as to the best means of insuring that the productive power of the employees in engineering and shipbuilding establishments for Government purposes should be made fully available. The Committee recommended (*inter alia*) that industrial disputes should never be allowed to result in a stoppage of work; and that disputes which could not be settled by the ordinary means should be referred to an impartial tribunal for immediate investigation and report with a view to a settlement. The Government accepted the recommendation, and appointed the Committee on Production as the tribunal indicated.

Hence in 1915, though there were over 700 disputes, there was only one with an aggregate duration of over a million days, a coal strike in South Wales, arising out of a deadlock over a wages agreement.

There was also only one large dispute in 1916, a strike of 30,000 jute workers at Dundee, which lasted from March 24 to June 8. The workpeople claimed an advance of 15% on piece-rates of wages, but ultimately returned to work on the old terms. This year was particularly free from disputes in the coal industry, which is generally the most affected by disputes.

Several unauthorized strikes, on a fairly large scale, occurred in the engineering trades in 1917. These excited a great deal of public attention, both because of the vital importance of maintenance of the fullest possible engineering output during the war, and also because the strikes were openly outbreaks of revolt, not only against the restrictions imposed on industrial freedom by various statutes and regulations, but also (what was felt to be even more serious) against the authority of the trade union executives. Measured, however, by the test of aggregate duration, only one of these disputes—the engineering strike of May 1917—was of very serious importance; and, as all the disputes had many features in common, it will suffice here to give an account of the dispute in May and of another in November.

In Nov. 1916 the Government had introduced a system of "trade cards," under which certain trade unions, including the Amalgamated Society of Engineers, were permitted to issue cards to their own members, conferring (under specified conditions) protection from military service. The system was obviously open to abuse, and the Government decided to abolish it. Simultaneously they had before Parliament a new munitions bill, which, as originally drafted, proposed (*inter alia*) to make provision for "dilution" (*i.e.* the partial utilization of unskilled or semi-skilled labour on work hitherto confined exclusively to skilled men) on commercial engineering work. Previously "dilution" had been confined to Government work.

The immediate occasion of the strike was a trivial dispute at an engineering works at Rochdale, the owners of which had committed a technical offence against the Munitions Acts. They were prosecuted and fined; but the result of the prosecution was not known until after the strike had begun.

On April 29 1917 the honorary secretary of an unofficial body called "the Manchester Joint Engineering Shop Stewards' Committee" sent out a letter calling upon engineers to come out on strike at the close of work on the following day against (1) dilution on private and commercial engineering work, (2) the withdrawal of the trade cards, and (3) the new munitions bill. Most of the engineering employees in Lancashire (which is the chief centre of the textile engineering trade) came out; and also in Sheffield, Derby, Southampton, and finally London. On the other hand, Glasgow, Newcastle, Cardiff, Birmingham, and Leeds, which were mainly "munition" centres, and not likely to be affected by the new policy, remained at work.

The unofficial committee who had taken charge of the strike denounced the official executives of the trade unions in violent terms. The executives, on their side, denounced the strike, and came to an agreement with the Government for the abolition of the trade card system. The Government supported the executives, declared their determination not to recognize the rebellious shop stewards, and finally arrested eight of these. Ultimately, however, the Government was obliged to receive the shop stewards' leaders; but under the guise of "the unofficial strike committee," and accompanied by the Executive Council of the Amalgamated Society of Engineers (the principal trade union concerned). A settlement was immediately arrived at, the unofficial committee agreeing to go back to their districts and get the men back to work, and leaving the negotiations in the hands of the Executive Council of the Amalgamated Society of Engineers.

The trade card system was abolished; but later in the year the minister of Munitions announced the withdrawal of the clauses in the Munitions Bill which would have permitted dilution on private work.

The Coventry strike was also a "shop stewards" strike, Coventry being one of the centres of the Shop Stewards movement. Unrest in this town was increased by the housing conditions, which were very bad, owing to the influx of munition workers and the consequent excessive overcrowding. On Nov. 19, the toolmakers and toolsetters at one of the engineering works in Coventry adopted a "stay-in" strike, as a protest against their inadequate rates of pay (in comparison with the unskilled men whom they had to instruct), and also in support of their demand for the recognition of the shop stewards. Next day the shop stewards went in a body to interview the head of the firm; he was ready to meet them, "and not ask who they were," but this was not enough for them; they demanded to be received as *shop stewards*. The employer refused, and the shop stewards called out all the workpeople. The whole of the engineering firms at Coventry were stopped within a few days, when it was estimated that 50,000 workpeople (men and women) were out. The strike was settled on Dec. 2 1917, by four members of the Government, who interviewed representatives of the employers and of the workpeople, the latter including some shop stewards. The negotiations which followed led up to an agreement between the Engineering Employers' Federation and the trade unions which for the first time recognized shop stewards, if duly elected and officially endorsed and controlled by their trade unions.

Apart from the engineering and munition trades the most important dispute of 1917 was a strike of *colliery examiners* (overmen, firemen, and shot-firers) in South Wales for the recognition of their trade union; the other underground and surface workers, to the number of nearly 128,000, were thrown idle by the strike. After a stoppage of three days the Colliery Examiners' Trade Union was recognized, and the employers agreed to set up a joint board to decide questions relating to firemen and shot-firers.

Industrial disputes were very numerous in 1918, but the great majority involved small numbers and were of short duration. Nearly all the considerable disputes occurred in the second half of the year; the extreme seriousness of the military situation in the first half of the year exercised a restraining influence sufficient to prevent many large movements. The only strike of any magnitude in this period was one among coal miners in the employment of a "combine" in S. Wales, who sought for recognition of a committee of their own, confined to workers in the pits of the combine.

An *engineering and munition* strike occurred at Coventry and Birmingham in July 1918, against the introduction of what was known as the "embargo." This was a prohibition by the Government of the engagement of any additional skilled men by certain firms. The prohibition applied only to a very small number of firms, but this fact was not known to the workers; indeed the existence of the embargo at all was not generally known until a notice (in misleading terms) was issued by one of the firms affected. The strike was brought to an end, after a week's stoppage, by the Government announcing that men absent from work on July 29 would have their protection certificates withdrawn.

Two strikes in the *cotton* trade occurred in this year, one in Sept. and the other in December. The first arose from a demand of the cotton spinners and piecers for unemployment pay for time lost owing to the restrictions on the working of the mills imposed by the Cotton Control Board to meet the shortage of raw material. They returned to work after a week's stoppage on the promise of an enquiry by an independent tribunal, to be appointed by the Government. The second strike was in support of a demand by the cotton spinners and piecers, and the card-room workers, for an advance of 40% on the current rates of wages (*i.e.* on the list prices, *plus* all the percentage additions already made thereto). They returned after nine days' stoppage, having obtained an advance of 50% on the standard piece-price list of wages, equivalent to about 30% on the current rates.

In this year there was also a long dispute (lasting 47 working days) between a cooperative society and the Amalgamated Union of Cooperative Employees. This union seeks to organize all classes of employees of cooperative societies, whether distributive or productive, without regard to occupation, or "craft." The cooperative society, however, demanded that its employees in printing works should belong to one or other of the "craft" unions, and not to the Amalgamated Union of Cooperative Employees. The matter was ultimately referred to arbitration, and decided in favour of the society.

The years 1919 and 1920 were years of great industrial unrest in a variety of trades. The hours of labour in the *engineering and shipbuilding* trades were reduced, as from Jan. 1 1919, from 53 or 54 to 47 per week; but many of the workers were dissatisfied, some desiring a reduction to 44 or even 40 hours, while others were aggrieved because the rates paid to piece workers and to "lieu" workers were not increased to compensate for the reduction of hours. (Time workers received the same rate of pay for the reduced hours as for the hours previously worked.) Workpeople, to the number of 150,000 in all, came out on strike in Jan. at various centres, and remained out for periods ranging from one to eight weeks. Some returned to work unconditionally; others agreed to return on the promise of a national settlement.

There was much unrest in the *coal mining* industry. One hundred and fifty thousand miners were on strike in Yorkshire in Jan. 1919, in support of a demand for a simultaneous stoppage of 20 minutes per shift for meals for surface workers; most of these were out for one or two days only. The demand was granted, for the period of Government control. The same men were on strike

again in July and Aug., for an advance of 14.3% in piece-rates to compensate for the reduction in hours from eight to seven per day; after a stoppage of from 25 to 29 days they accepted the national settlement, which gave an advance of 12.2%. In March 100,000 miners in South Wales, the Midlands, and Yorkshire were on strike, and another 75,000 miners in Nottinghamshire, Derbyshire, Lancashire, and other districts were on strike in July, over the question of the miners' demands for increased wages, a reduction of hours, and the nationalization of the mines.

There was a great strike in the cotton trade, for a reduction of hours and 30% advance in wages, in June and July 1919, both the spinning and the weaving sections being affected. The advance was granted, and the hours were reduced from 55½ to 48 hours per week (instead of 46½, as asked).

The greatest railway strike that had ever occurred in England began at midnight on Sept. 26 1919. An agreement had been made between the Government, the Railway Executive Committee (representing the companies), and the trade unions in March 1919, providing, *inter alia*, for the determination by negotiation of new standard rates of pay for the various grades. Standard rates were agreed upon, in Aug., for drivers and motormen, firemen and assistant motormen, and engine cleaners; and in Sept. the Board of Trade forwarded to the National Union of Railwaymen their proposals for the standard rates of other grades, showing an average advance of 100% on pre-war rates, with a minimum of £2 a week. The Union rejected these proposals, claiming that the new rate should be based on the highest standard rate already existing for each grade, *plus* 33s. war wage, with a minimum of £3 a week. Failing a favourable reply by Sept. 25, they announced an immediate strike. Negotiations continued, and fresh proposals were made by the Government; but the Union did not feel justified in postponing the strike, which accordingly began, as stated, at midnight on Sept. 26. The Associated Society of Locomotive Engineers and Firemen, although not directly concerned in the dispute, supported the National Union of Railwaymen, and its members also ceased work.

On Oct. 1 a conference, arranged by the National Transport Workers' Federation (to which the railwaymen are affiliated), was attended by representatives of the Trades Union Congress Parliamentary committee, of the Labour party, and of a number of other trades besides railways. A mediating committee was appointed, and negotiations were resumed between the Government, the mediating committee, and the National Union of Railwaymen. A settlement was reached on Oct. 5, and work was resumed on the following morning.

The settlement provided for the resumption of negotiations, with the understanding that they should be completed by Dec. 31 1919; and for the stabilization of wages at their then existing level up to Sept. 30 1920 (subject to review at any time after Aug. 1 1920). It was also provided that "no adult railwayman in Great Britain shall receive less than 51s. so long as the cost of living is not less than 110% above pre-war level."

A strike of ironmoulders, coremakers, and iron and steel dressers began on Sept. 22 1919, and lasted until Jan. 12 1920. About 65,000 men were involved in the immediate dispute; but the shortage of castings consequent on the dispute greatly hindered the working of the engineering industry for many months.

The demands of the men were for an advance in wages of 15s. a week for journeymen and 7s. 6d. a week for apprentices. At the settlement on Jan. 12 they accepted an advance of 5s. for men over 18 years of age, the same as had been granted to men in the engineering trades in the previous November. It was also agreed that negotiations should be resumed on the questions of: (1) the general working conditions in foundries; (2) questions arising out of the introduction of the 47-hour week; (3) minimum standard rates for the various districts; and (4) the jurisdiction of the unions over apprentices, and the wages of apprentices.

A strike of all classes of workpeople in the furnishing trades began in the Manchester district and N. E. Lancashire on June 27 1919, in support of a demand for an advance in wages, a working week of 44 hours, and other concessions. On July 26 a lock-out was declared at High Wycombe, Birmingham, Nottingham,

Bristol and other centres, to enforce the termination of the dispute. At most of the centres involved in the lock-out settlements were reached by the end of Oct., advances in wages being granted; in some cases provision was made for the discussion of proposals to introduce sectional work, piece-work, or female labour, where not formerly in operation. The original dispute was also settled at the end of Oct., various advances being granted. At High Wycombe, where the largest number of workpeople was involved, the lock-out was not brought to a close until nearly the end of Nov.; here also advances in wages, varying according to sex and standing and the class of work done, were granted.

The year 1920 was remarkable for one dispute, the national coal strike of Oct. and Nov., the aggregate duration of which was second only to those of the two previous great coal strikes in 1893, and in 1912; and for an unprecedented number of smaller disputes, in a great variety of trades, many of which would have ranked as "great" disputes in a normal year. There were also many minor disputes in the building and in the textile trades. The coal strike began out of a demand put forward by the Miners' Federation of Great Britain (1) for a flat-rate advance in wages of 2s. a shift for all persons of the age of 18 years or over, with corresponding advances for those under that age; and (2) for a reduction of 14s. 2d. a ton in the price of domestic coal. These demands were presented to the Controller of Coal Mines on July 15, and refused by the Government on July 26. A ballot of the Federation showed a great majority (666,782 to 238,865) in favour of a strike in support of these demands; and strike notices were handed in, in every district, to expire on Sept. 25.

Negotiations between the Government and the miners continued, in the course of which the miners dropped their demand for a reduction in the price of domestic coal. The Government, after making various alternative proposals which were not acceptable to the miners, concentrated on the policy of making any advance that might be granted bear some relation to increased output. The miners, however, still pressed for an immediate unconditional advance of 2s. The strike notices were twice postponed, at first for a week and then for another fortnight, in order to allow the negotiations to continue. At this stage the mine-owners were called into conference; and meetings between representatives of the miners and of the mine-owners took place almost daily from Sept. 25 to Oct. 2, inclusive.

During the first fortnight of Oct. a second ballot of the miners took place on certain proposals which had been formulated by the mine-owners at these conferences. These were to the effect that if, during the first fortnight of Oct. there were indications that the output of coal was at the rate of 240,000,000 tons per annum, an advance of 1s. a shift should be conceded as from Oct. 1, with an additional 6d. for each 4,000,000 tons, up to 3s. at 265,000,000 tons. The wages for the remainder of the year would be similarly regulated, and the whole scheme would come up for review at the end of December. The owners also pledged themselves to coöperate with the men in measures for increasing output. These proposals were rejected by the men, on a ballot vote, by a still larger majority (635,098 to 181,428); and work at the mines ceased on Oct. 16, except that certain men were allowed to continue at work for keeping the mines in order.

The strike was debated in the House of Commons on Oct. 19; and tentative suggestions for a settlement were made by Mr. Brace (at that time a member of the executive of the South Wales Miners' Federation), and by other members. Informal conversations, and then formal negotiations, followed between the Government and the miners' representatives, to which at a later stage the mine-owners also were called in; and an agreement was reached on Oct. 28 which the miners' representatives undertook to submit to their members, with a recommendation of acceptance "as a temporary measure." The agreement pledged the miners and the mine-owners to coöperate with the view of increasing output; also to prepare a scheme for the future regulation of wages, "having regard, among other considerations, to the profits of the industry, and to the principles upon which any surplus profits are to be dealt with." Pending the preparation of this scheme an immediate advance of 2s. a shift was to be granted

to persons of 18 years of age and over, with corresponding advances to persons under that age; and from Jan. 3 1921, until the new scheme was ready, the advance would be automatically adjusted, at monthly intervals, in accordance with the surplus output in excess of 219,000,000 tons a year. The ballot upon these terms showed a small majority against acceptance (346,504 to 338,045), on a reduced total vote; but at the miners' delegate conference at which the result was announced it was decided that work should be resumed on Nov. 4, or as soon after as possible, in view of the rule of the Miners' Federation which requires a two-thirds majority for the continuance of a strike.

A strike in the *building* trade of Scotland occurred in May, June, and July 1920. During the war wages in the Scottish building trade had been regulated by awards given every four months, as in the engineering and shipbuilding trades. A claim for an advance of 6d. an hour, as from April 1 1920, came before the Industrial Court in March under this agreement, and was refused. The joiners in the west of Scotland, influenced by the high rate of wages given to joiners in the shipyards, had withdrawn from the National Agreement, and claimed the advance of 6d. independently of the other building trades operatives; and, when this award was given, they came out on strike, to the number of about ten thousand. Negotiations with the employers ensued; and at the beginning of July about a third of the operative joiners had obtained their demand for a rate of 2s. 6d. an hour. Bricklayers and masons and their labourers had also obtained an advance in the west of Scotland; but at Edinburgh and Dundee, and in Ayrshire, they were out on strike. As delay to housing schemes was feared through the strike, further conferences were held under the chairmanship of an officer of the Ministry of Labour; and an agreement was reached on July 8 giving all classes of operatives an advance for the period from July 9 to Nov. 30. The parties also agreed to meet again, to consider a scheme for levelling up rates between sections, and for the grading of districts.

*Shipyard joiners and carpenters* came out on strike on Dec. 1 1920, against a proposed reduction in wages of 12s. a week. (This was the first strike, on a considerable scale, against a reduction of wages since those of 1908, mentioned above.) The employers alleged that the ship-joiners had received a special additional bonus during the preceding time of pressure in the shipyards, over and above that given to other shipyard workers, because it would have been impossible otherwise to obtain the necessary labour, in view of the intense competition from the building trades; and that the exceptional circumstances which had justified the advance had now come to an end. The number involved at the end of Dec. was about ten thousand.

A strike of *piano workers* in London, to the number of about 6,500, began on April 10 and lasted for three months. The employers sought to introduce a system of payment by results, which was objected to by the workers. Work was resumed on the systems of payment existing in each factory; with a provision that a ballot vote should be taken within three months to determine the future system of payment for the entire trade.

A strike of *electricians*, which was of great importance owing to the principle involved, began on July 2 and ended on Sept. 17 1920. The members of the Electrical Trades Union came out on strike at an engineering works at Penistone (Yorks), against the employment of a foreman who was not a member of their trade union. The Engineering Employers' Federation replied by a lock-out of all members of the union employed in federated firms throughout the country. The Government appointed a Court of Enquiry, under the Industrial Courts Act, to enquire into the dispute; but the day after the Court had begun taking evidence the Electrical Trades Union notified to the Joint Industrial Council for the Electricity Supply Industry their readiness to withdraw the question of principle, *i.e.* the claim that foremen must be members of a trade union. The dispute was settled on these lines on Sept. 16, the men withdrawing their strike notices and the employers the lock-out notices. The number of men involved by the lock-out was about seven thousand.

A strike of *shirt and collar makers* in Belfast, Londonderry,

Coleraine, Dublin, and other towns, began on June 12 1920; and lasted for over two months. The cutters only were directly involved, to the number of about 302; but about 17,000 other workpeople were thrown out of work. The cutters demanded higher wages, and the strike was settled by a compromise.

A strike in the spinning branch of the *cotton* trade began at Oldham on Sept. 15 1920. During the war an agreement had been made for the employment of female "creelers" (who carry away the finished yarn) to help the spinners in cases where "little piecers" (boy assistants) were not available; and it was part of the agreement that the spinners should receive extra payments, in compensation for the additional work thrown upon them when "creelers" were employed instead of "little piecers." In Sept. 1920, an agreement was signed between the master spinners and the Operative Spinners' Trade Union withdrawing, in part, these extra payments. A large number of the spinners came out on strike against this agreement, in defiance of the executive of their union. The strike began on Sept. 15, and the maximum number on strike was reached a week later, when the number was about 20,000; and about an equal number of cardroom workers and others were thrown out of work by the dispute. The men gradually went back to work on the terms of the agreement; most of them were back by Oct. 5, but the strike was not quite at an end until the end of that month.

*Coal Strike of 1921.* The first seven months of 1921 were notable for a rapid and continuous increase in the number of trade disputes concerning proposals for reduction of wages. The strike of shipyard joiners and carpenters against a proposed reduction of 12s. per week, which had begun on Dec. 1 1920, and came to involve directly some 10,000 workpeople, continued until Aug. 1921, when a settlement was reached on the basis of a reduction of 9s. per week, to take effect in two stages. Among other important disputes in this period was the strike in Feb. 1921 of some 5,000 nut and bolt workers in the Black Country against a proposed wage reduction, which lasted five weeks, the employers' terms being then accepted. In March 3,500 vehicle builders and 2,170 waterproof garment finishers came out on strike against proposed reductions of wages; the former dispute lasted four weeks and ended in the acceptance of a modified reduction; the latter lasted five weeks and ended in the acceptance of the reduction on condition that it should take effect in two stages. In June a national engineering strike was threatened but avoided at the last hour, while 10,000 engineering apprentices in the Manchester district struck against a proposed reduction in wages, which three weeks later was accepted. In June, also, a new wages agreement in the cotton textile industry, involving an immediate reduction of about 10% on actual wage rates, was only made after a dispute which lasted three weeks and involved some 375,000 operatives.

None of the strikes of 1921 against proposed reductions in wages compares, however, in magnitude or consequence with the great national coal strike, which began on April 1 and ended on July 1 in an agreement which was to last until Sept. 30 1922, and thereafter, until terminated by three months' notice on either side. The position at the end of the coal strike of 1920 has already been described. Briefly a temporary settlement has been made under which the wages of miners varied according to the total output of coal from the mines of Great Britain: the more the output, the higher were the wages to be received. The miners and owners were under an obligation to prepare a scheme not later than March 31 1921, for the future regulation of wages in the industry, "having regard, among other considerations, to the profits of the industry and to the principles upon which any surplus profits are to be dealt with." The industry was still under Government control, and the "control" powers of the Mines Department of the board of trade did not expire, in any event, until Aug. 31 1921.

The coal industry, however, did not escape the effects of the general industrial depression, which indeed may be dated from the coal strike of 1920. The values of exported coal fell heavily, while the demand for coal for industrial or domestic consumption at home also decreased. The output figures for each of the

four months from Dec. 1920 reflect the changes in the current demand. In the five weeks ended Dec. 25 the output for Great Britain was 25,406,700 tons; while in the five weeks ended Jan. 29 1921, it was 21,803,600 tons. In the four weeks ended Jan. 29 it was 18,540,500 tons; while in the four weeks ended Feb. 26 it was 17,369,100 tons, and in the four weeks ended March 26, 16,435,200 tons. An incidental result of this decreased output was the disappearance as from Feb. 28 of the wages advances granted under the settlement of Nov. 1920. In so far as the position, as affected both by the decreased output and by the reduction in values of export coal, may be judged from the Mines Department statistics, in Feb. 1921 the average loss over the whole of the collieries of Great Britain on every ton of coal disposed of commercially was 5s. 11½d. In two districts, namely Yorkshire, and Derby, Nottingham and Leicester, there were small credits of 3½d. and 1½d. per ton respectively; while the debit balances ranged from 4s. 0½d. per ton in Durham to 18s. 1½d. per ton in South Wales.

In these circumstances the Government decided to terminate their control of the mining industry on March 31. This was the date at which the agreed scheme for the future regulation of wages in the industry was to be ready, but it was five months earlier than the date at which decontrol had been expected. On the one hand, the fall in the price of export coal to such an extent that there was no appreciable difference between the export price and the inland price, made it no longer necessary to regulate the pit head prices and the distribution of coal, and all such regulation was withdrawn as from March 1. On the other hand, the continuance of financial control, which had been a corollary of the regulation of prices and distribution was only involving the Government in heavy financial liabilities. The Coal Mines (Decontrol) Act, 1921, "an act to curtail the duration of and amend the Coal Mines (Emergency) Act, 1920," was therefore passed. The Act received Royal Assent on March 24, and its effect was to terminate the special interest the Government had hitherto had in the Mining Industry, as regards, for example, output and prices, wages and profits. Control at that moment meant financial assistance to the industry, and the removal of that financial assistance on March 31 made the formulation of a new wages agreement a matter of imperative urgency, if the work of the mines was to be continued after decontrol.

The decision of the Government to decontrol was communicated by the president of the board of trade to the mine-owners and miners, i.e. the Mining Association and the Miners' Federation of Great Britain, on Feb. 23. At the time the announcement was made, the Mining Association and the Miners' Federation were in the midst of negotiations with regard to the permanent scheme for the regulation of wages, which under the agreement of Nov. 1920, they were to complete by March 31 1921. On Feb. 25 the two bodies met again, and agreement was reached upon a considerable number of important points. But on one fundamental issue it was found impossible to agree. The representatives of the Miners' Federation insisted upon the necessity of a national wages scheme, with some form of a national pool, for the industry. The representatives of the owners insisted that wages must be based upon the wage-paying capacity of the districts, national discussion being confined to the enunciation of certain general principles which might provide the districts with some uniform method of determining their wage-paying capacity.

A definite conflict of principle had thus occurred. It was clear however that no scheme designed to be permanent would be applicable without modification to the abnormal position in which the industry would find itself on decontrol on April 1. It was therefore conceivable that agreement might be reached on a temporary scheme applicable strictly to the emergency period, leaving the points of difference on the permanent scheme for further discussion. In this way the occurrence of a dispute immediately upon the cessation of control might be avoided. Following upon a joint meeting of the two sides held on March 17, the National Delegate Conference of the Miners' Federation decided to ascertain the opinion of the districts as to whether or

not they were prepared to abandon temporarily the policy of a national wages board and a national pool, and to empower the national executive to proceed with the negotiations with a view to establishing a temporary agreement on a district basis. On March 24 the Conference reassembled to receive the replies of the several districts, and these indicated that a very large majority of the Federation were against the proposal to enter into any temporary agreement on a district basis. There was thus no movement towards the owners' position. Notices terminating on March 31 contracts of employment at the existing rates having already been issued by the owners, the Executive Committee of the Miners' Federation met on March 30, and sent out the following instruction to the districts:—"That all notices must take effect regardless of occupation in every mine and plant in the Miners' Federation." Practically the whole of the men ceased work in accordance with this instruction at the close of the last shift on March 31. There was, however, some divergence in the districts on the question of withdrawing the pumpmen and enginemen who were covered by the official instruction of the Federation. These men were not withdrawn in all cases.

At this stage it may be noted that there were some points of agreement between the owners and miners. The agreement of Nov. 1920, envisaged a permanent scheme for the regulation of wages which would have regard "to the profits of the industry and to the principles upon which any surplus profits are to be dealt with." Working from this basis, by the time of the joint meeting of Feb. 25, four further principles had been agreed upon as follows:—

1. Wages must conform to the capacity of the industry to pay.
2. The receipt of a standard wage should justify a corresponding minimum profit to the colliery undertakings.
3. Any surplus remaining after these, and, of course, the usual working costs, had been met, should be divided between the men and the owners in agreed proportions, the workpeople's share to be an addition to their standard wages.
4. Joint audits of the owners' books by accountants representing each side should be made to ascertain all the data necessary for the periodical determination of wages.

On all other matters arising out of the proposed permanent scheme there were differences of considerable importance between the two sides. The following account of the main differences is based upon the draft agreement approved by the Delegate Conference of the Miners' Federation of Great Britain on March 10 (i.e. at the first available opportunity after the joint meeting of Feb. 25), and the report of the mine owners on the situation which was submitted after approval by the Central Council of the Mining Association, to the president of the board of trade on March 25 (i.e. immediately after the refusal of the miners to enter upon negotiations with a view to a temporary settlement on a district basis):—

1. The miners proposed that there should be established a National Board, consisting of 16 representatives of each side, which should determine all questions of wages and profits affecting the mining industry as a whole, i.e. the national regulation and distribution of wages. The National Board would take over the powers and duties of the existing district conciliation boards with regard to the fixing of general rates of wages. The owners would agree to maintain in production by the means of a national profits fund all existing collieries, and all collieries developed subsequently, until such times as the National Board might decide to the contrary.

On these points, the owners' position was that the idea of a "national profits fund" was abhorrent to them, that they wished district conciliation boards to be the sole authorities for fixing wages, and that national discussions should only deal with questions of principle, so as to provide the districts with a uniform method of determining wages.

2. The miners proposed that the new standard wage should be made up by incorporating all the existing percentage additions to district basis rates with those district basis rates, special allowance being made in favour of the men who were benefitting under the flat rate minimum advance which was guaranteed with the 20% wages advances of March 1920. The owners proposed that the new standard wages should be the district basis rates, plus the percentage additions prevailing in July 1914, plus the percentage additions made consequent upon the reduction in hours from 8 to 7.

3. The miners proposed that against their standard wages should be set, as minimum profits to the owners, a sum amounting in the aggregate to 10% of the sum paid as standard wages. The owners proposed that this figure should be 17%.

4. The miners proposed that any surplus remaining after meeting standard wages, other costs and minimum profits, should be divided between miners and owners in the proportion of 100 to 10. The owners proposed that that proportion should be 80 to 20.

5. The miners proposed that their share of this surplus should be distributed by means of national uniform flat rate additions to their standard wages. The owners proposed that the miners' share of the surplus as ascertained in each district should be distributed as a percentage addition to the standard district rates.

6. Whereas the miners' proposals meant that the whole mining industry in Great Britain should be treated as one unit within which wages would be varied uniformly, the owners proposed to take as the units of uniform variation, the 25 districts among which the collieries of Great Britain are distributed by the Second Schedule of the Mining Industry Act, 1920.

With regard to the question what modifications, if any, might be introduced to meet the abnormal conditions of the period following immediately on control, the owners expressed their willingness to waive their share of the surplus in favour of the workmen, on condition that ascertainment of the proceeds of the industry in each unit should be made at monthly periods during the continuance of the concession; but they insisted that it was inevitable that wages should go down on decontrol. From the miners' point of view it was evident that the introduction of their scheme at that moment might mean the loss to the men of war wage and Sankey wage, and the miners' argument therefore was that the Government's obligation to pay war wage or Sankey award did not cease by the decision to decontrol the trade on March 31. The war wage had been given to meet the increased cost of living when the latter was only 80 per cent in excess of the pre-war figure, and (though the Government rejected this interpretation) under the terms of the award the miners claimed that the wage was liable to revision only when the cost of living fell again to that point. With regard to the Sankey wage, the argument of the miners was that the Government had accepted the Sankey Commission's recommendations for an advance in wages of 2s. per day, and if the Government now proposed that these conditions should be abandoned, it would be guilty of a breach of faith. The miners reiterated at all times from Feb. 23 to March 31 their demand that the Government should abandon its decision to decontrol the industry, or at least should continue to subsidize it during the existence of the depression from which it was suffering.

The general argument of the miners at this time was that the situation demanded a full national settlement of the wages and profits problem for the industry. The trade as a whole needed uniform peace and security, and district or local negotiations must result in strife. The workmen and their families had to live in the poor districts as well as in the rich, and for uniform expenditure of energy there should be uniform reward. This had been recognized by the Government, first by the payment of uniform war wages to meet the increased cost of living, and, secondly, by the acceptance of the decision of the Sankey Commission to raise uniformly the wages of all coal miners to meet the agreed case for a uniform advance in their standard of living. A National Wages Board, exorcising the right to distribute nationally both wages and profits, need not necessarily result in a uniform profit for all undertakings, but by means of a small levy upon the total tonnage raised in every mine, money would be made available for maintaining poor collieries in production as long as their coal was in demand.

The view of the owners, on the other hand, was that the wide variations in the losses of different coalfields made anything in the nature of a national settlement of wages impossible. While there were such divergencies between district and district, each district must determine its own wages by its ability to pay, and the individual who could not pay the wages so determined must decide for himself whether to close his pits or to bear the loss. The country could not afford to keep unprofitable pits working.

From the opening of the strike on April 1, four whole months passed before an agreement between the owners and miners was reached. The first difficulty to secure a resumption of negotiations encountered was in the Government insisting that the first subject to be discussed should be the return of the safety men to the mines, while the miners held that negotiations were useless

if their demands for a wages settlement along national lines, and a national profits' pool, were totally unacceptable. But the influence of the other members of the Triple Alliance secured a modification of both points of view, and joint negotiations were resumed on April 11 and 12. On April 12 the view of the Government was outlined that, while the miners' demand for a national settlement of wages might be practicable, their demand for a national pool of profits was impracticable. A pooling arrangement for the equalization of wages in the industry was declared not to be possible without the resumption of complete and permanent control by the State of the mining industry. A national settlement of wages, however, was suggested, by which the 2nd, 3rd, 4th and 5th points at issue between the owners and miners as outlined above should be determined by the joint conference, whilst subsequent differences of interpretation should be referred to a national joint committee of owners and miners. The prime minister explained the Government's proposals as regards the abnormal period following upon decontrol, as follows:—

"If and when an arrangement had been arrived at between the coal owners and the miners as to the rate of wages to be paid in the industry, fixed upon an economic basis, the Government would be willing to give assistance, either by loan or otherwise, during a short period, in order to mitigate the rapid reduction in wages in the districts most severely affected."

These proposals were fully discussed, but the miners' officials intimated their inability to accept them or to abandon their former position, and the conference thereupon ended. This failure, at once brought to a head the question whether the other two members of the Triple Alliance, namely, the National Union of Railwaymen<sup>1</sup> and the National Transport Workers' Federation, would take sympathetic strike action in support of the miners. A general meeting of the National Union of Railwaymen, and a full conference of the executives of unions affiliated to the National Transport Workers' Federation, were summoned, and remained in session until April 16, when the question of sympathetic action was finally settled. The mediatory efforts of the railwaymen and transport workers on April 9, which secured the resumption of negotiations between owners and miners, had been supported by a decision that a sympathetic strike should take place on the night of April 12 unless negotiations between the miners, owners and Government were reopened before that date. This strike of April 12 was avoided by the resumption of negotiations on the 11th, but on the 13th, the day after the failure of the resumed negotiations, the railwaymen and transport workers determined to strike at 10 P.M. on April 15 in support of the miners. This sympathetic strike of April 15 was avoided, however, at the last moment. In the late evening of the 14th a group of private members of the House of Commons, after hearing a statement by Mr. Evan Williams, president of the Mining Association, dealing with the effect on the miners' actual earnings of the owners' proposals, invited Mr. Frank Hodges, the secretary of the Miners' Federation, to make a similar statement on behalf of the miners. In the discussion which followed his speech, it was understood from Mr. Hodges that the miners would be prepared to discuss a temporary wages settlement, provided that a period of time were fixed for the negotiation of a permanent settlement, to contain the principles of a national pool and a national wages board. The Prime Minister was at once communicated with, and on the following morning he invited owners and miners to meet him again for a further consideration of the wages question. The executive of the Miners' Federation, to general surprise, abruptly declined this invitation, and Mr. Hodges, whose "offer" was thus ignored, tendered his resignation (though it was afterwards withdrawn). The leaders of the railwaymen and transport workers, however, in these circumstances decided not to proceed with the sympathetic strike, and a breach was created in the Triple Alliance.

The next stage in the history of the dispute was a second series of joint negotiations between owners and miners, from April 22

<sup>1</sup> The Associated Society of Locomotive Engineers and Firemen before the close of this episode joined the other railwaymen and the transport workers in the discussions and the decisions on the question of sympathetic strike action.

to 28, as a result of a further invitation from the Prime Minister. This conference produced a further set of proposals from the owners, and the first detailed proposals for a settlement made by the Government in the course of the dispute, but these were rejected on the 28th by the National Delegate Conference, on the ground that they did not concede "the fundamental principles of a National Wages Board and a National Pool." No definite progress had been made as regards the proposed establishment of a permanent scheme for the regulation of wages in the industry. The Government suggested that the period of the permanent scheme should be one year from the close of the temporary period, subject thereafter to 3 months' notice on either side. This suggestion became part of the final settlement of July 1. They declared that a national pool or levy would involve legislation and must be regarded as a political issue; but they would accept a "National Wages Board" entrusted with the tasks of drawing up a schedule of districts and determining the principles by which wages should be adjusted in the districts, as well as with the duties of interpretation. The owners also spoke at this time of "areas" rather than "districts," the "areas" being the six divisions of Great Britain, among which the 25 districts are distributed by the Second Schedule of the Mining Industry Act, 1920. On the other hand, as a result of the statements of the owners and the Government, substantial progress was made with the preparation of a detailed temporary scheme for the emergency or abnormal period. The main points of these proposals may be summarized as follows:—

1. The duration of the temporary scheme was to be three months.
2. In each of the three months, a maximum sum per shift should be fixed, and the wages of no miner should be reduced by more than that maximum sum. The maximum reduction would be expressed as a national flat rate.
3. For the first month a maximum reduction of 3s. per shift was proposed and for the second month, one of 5s. 6d.
4. The Government were prepared to make a grant of £10,000,000 as their share in the cost of the scheme, and it was suggested that a portion of this grant might be carried forward into a fourth month.
5. The owners were prepared to waive all share in the surplus in any area, if the taking of that share would have the effect of reducing the rates of wages in one month as compared with the previous month. This was an elaboration of the proposal of the owners as regards the emergency period given above, and made public on March 25.
6. The owners were also prepared to agree that, during the period of the temporary scheme, deficiencies in standard profits should not be carried forward from one accounting period to another.

The miners, however, were as much opposed to this proposed temporary scheme as to the owners' permanent scheme. They could not accept a temporary settlement which was related to district settlements; they could not accept reductions which would force their wages below the cost of living level; and they maintained their demand that the Government should render financial assistance to the industry so as to prevent this occurring. On a cost of living basis they argued that the maximum reduction in the first place should be 2s. per shift: whereas the Government proposed a first reduction of 3s. per shift.

From the close of the second series of joint negotiations on April 28, a whole month elapsed before official negotiations were resumed. A third series of negotiations was then begun on May 27, an address being made by the Prime Minister to a joint assembly of the central committee of the Mining Association and the executive committee of the Miners' Federation. Proposals for a settlement were submitted by the Government separately to the two sides on May 28, and on June 3 the observations of owners and miners on these proposals were communicated to the Prime Minister. The reply of the Miners' Federation, drawn up by their executive committee, was to the effect that in every instance the districts had rejected the proposals. On June 4 the Prime Minister announced that the Government's offer of a grant of £10,000,000, intended to mitigate the reductions in wages and allow of a gradual scaling down of wages until they reached an economic level which the industry could sustain, would be withdrawn unless a settlement were reached within 14 days. This announcement was followed by joint meetings between owners and miners on June 6, 7, 8 and 9, and on June 10 the National

Delegate Conference of the Miners' Federation adopted a recommendation of their executive to refer the alternative courses of action to a ballot vote of their members. The alternatives were put to the men as follows:—

- "(1) Are you in favour of fighting on for the principles of the National Wages Board and National Pool, with loss of Government subsidy of £10,000,000 for wages if no settlement by June 18 1921?"
- "(2) Are you in favour of accepting the Government's and owners' terms as set forth on the back of this ballot paper?"

The result of the vote was known on June 17: the first question was answered in the affirmative by 435,614 members, and the second question by 180,725. The previous decisions of the representative bodies of the Federation were thus emphatically confirmed. The Government therefore announced their withdrawal of the proposed subsidy, and the basis for a temporary settlement had for the time being disappeared.

From the point of view of the final settlement, however, this third series of negotiations was important for the modifications which were made in the owners' permanent scheme. The owners definitely adopted the Government suggestions regarding the duration of the permanent scheme and the establishment of a National Wages Board; they proposed the establishment of similarly constituted district boards to determine district questions; they accepted a proposal made by the Government that if the rates of wages as fixed under the permanent scheme did not provide a subsistence wage to low-paid day wage workers, additions in the form of allowances per shift worked should be made by the decision of the district wages boards; and they were prepared to guarantee that the miners should receive during the first year of the agreement a minimum percentage addition of 20% to the standard wage as proposed by the owners.

The final period from June 17 to July 1 was remarkable for the marked changes in the attitude of the executive of the Miners' Federation. On June 18 an invitation was issued to the executive committees of all unions affected by wages disputes to meet the miners' executive at the earliest possible date, with the object of taking joint national action with the miners to secure their several demands. The meeting was arranged for June 25. Meanwhile the annual conference of the Labour party held at Brighton on June 21-4 showed plainly that no support for extended militant action would be given by other trade unions. The projected meeting of June 25 was therefore abandoned, and the Prime Minister was again approached by the miners' executive with a view to securing a satisfactory wages settlement. Joint negotiations between miners and owners were accordingly resumed on June 27, and on the evening of that day it was reported to the Government that an agreement had been reached, upon the assumption that the Government would reopen their offer of a grant of £10,000,000 to the industry. On June 28 the Government expressed their willingness to subsidize wages as required, during the temporary period, up to a maximum of £10,000,000. The miners' executive then referred the proposed terms to their districts; and their recommendation that the terms should be accepted was indorsed at the district meetings. On July 1 the final agreement between the Miners' Federation and the Mining Association was signed, the House of Commons voting, on the same day, a subsidy in aid of wages in the form offered by the Government on June 28. Work in the coal mines throughout Great Britain was resumed as rapidly as the circumstances at each colliery permitted.

The agreement largely incorporated the terms of the interim proposals. With regard to the temporary period of three months, it was agreed that the maximum national flat-rate reductions should be 2s. per shift in the first month, 2s. 6d. in the second month, and 3s. in the third month; and that, in those districts where it was not necessary to enforce the full maximum reduction, the wages payable during the temporary period should be calculated in terms of uniform district flat-rate reductions, and not in terms of basis rates *plus* percentages. On the other hand, the Government subsidy was now a maximum sum, and any balance not issued in respect of the temporary period of three months was no longer available to ease any further reductions

which might be necessary in the fourth month after the settlement. With regard to the permanent scheme the settlement provided that standard profits should be 17% of standard wages, and that 83% of the surplus proceeds should be applied to the payment of wages above the standard rates. The duration of the guarantee that the miners should receive a minimum percentage addition of 20% to the standard wages, was extended from one year to the whole period of the permanent scheme. In other respects the permanent scheme was the one first outlined by the owners before the beginning of the strike, but it included the important modifications and safeguards introduced in the course of the third series of joint negotiations.

The outbreak of the strike had led to the Government passing an Emergency Powers Act into law, to enable exceptional provision to be made for the protection of the community when "any action has been taken, or is immediately threatened by any person or body of persons, of such a nature or on so extensive a scale, as to be calculated . . . to deprive the community, or a substantial portion of the community, of the essentials of life." On March 31 a proclamation was made under this Act declaring a "state of emergency" to exist, and by successive renewals at monthly intervals the "state of emergency" was continued until the settlement of July 1. Within this general period a state of more intense emergency occurred from April 8 to June 2. During this latter period the Reserves were embodied, and in addition to the enrolment of special constables, a Defence Force was enlisted with the object of supporting the police in providing protection to volunteers who were maintaining the mines in condition, or who might be required to carry on transport work in the event of the extension of the coal strike to railway and transport services. During the state of emergency, a series of emergency regulations were in force under which the Mines Department of the board of trade controlled the supply, consumption and movement of coal, and the police authorities in the various parts of the country were endowed with special powers for the suppression of sedition.

## (B) FOREIGN COUNTRIES

A brief account is given below of the most recent statistics of the strikes and lock-outs in the principal European countries, other than the United Kingdom, available in 1921.

*France.*—Detailed statistics of strikes and lock-outs for the years 1890 to 1912 and summaries for the years 1913 and 1914 had been published by the French Ministry of Labour. The following are the totals for the years 1907-14:—

Year	Number of Disputes	Number of Workpeople directly affected	Aggregate Duration in Working Days
1907	1,279	198,136	3,563,237
1908	1,104	124,248	2,307,120
1909	1,036	169,509	3,581,928
1910	1,511	290,899	4,887,837
1911	1,474	230,795	4,037,475
1912	1,120	268,230	2,335,891
1913 <sup>1</sup>	1,073	220,448	2,223,781
1914 <sup>1</sup>	672	160,566	2,192,078

<sup>1</sup> The figures for the years 1913 and 1914 relate only to strikes.

The principal groups of industries affected by the disputes were in 1907 the transport group involving 43,248 workpeople; in 1908 and 1909 the building trade group involving 56,601 and 42,658 workpeople respectively; in 1910 the transport group involving 83,025 workpeople, and the building group involving 75,695 workpeople; in 1911 the building group involving 93,660 workpeople; and in 1912 the mining and quarrying group involving 137,602.

During the years 1907 to 1912, 46% of the total number of workpeople affected were involved in disputes concerning wages, 19% in disputes concerning hours of labour, 10% in disputes concerning the employment of particular classes of persons, 11% in disputes concerning working arrangements and the remaining 14% in disputes due to other causes. The results of disputes during the period under survey were as follows: disputes involving 12% of the total number of workpeople directly affected terminated in favour of the workpeople; disputes involving 44% in favour of the employers; those involving the remaining 44% in a compromise.

*Germany.*—From 1899 statistics of strikes and lock-outs other than in agriculture have been published annually by the German Federal

Statistical Office. The figures for the period 1907 to 1918 are summarized below:

Year	Number of Disputes	Number of Workpeople directly or indirectly affected
1907	2,512	280,016
1908	1,524	119,781
1909	1,652	130,883
1910	3,228	390,706
1911	2,798	385,216
1912	2,834	493,749
1913	2,464	323,394
1914	1,223	98,339
1915	141	15,238
1916	240	128,881
1917	562	668,032
1918	772	1,325,897

The principal groups of industries affected by disputes in 1913 were the metal and engineering group involving 81,025 workpeople, the mining and smelting group involving 78,221 workpeople, and the building trades group involving 69,899 workpeople. In 1918 the principal groups were the mining and smelting group with 336,378 workpeople involved, and the metal and engineering group with 279,921 workpeople involved.

Of the total number of disputes occurring during the period 1907-18, 52% arose on questions of wages, 16% on questions of hours, and the balance on questions of the employment of particular classes of persons, working arrangements and miscellaneous matters. During the same period 15% of the total number of disputes were settled in favour of the workpeople, and 39% in favour of the employers, while 46% were compromised.

*Belgium.*—Statistics of strikes and lock-outs are published by the Belgian Ministry of Industry, Labour and Supplies. The table given below shows the number of strikes and lock-outs, and the number of workpeople directly affected, in the period 1908 to 1919, with the exception of 1914 to 1918.

Year	Number of Disputes	Number of Workpeople directly affected
1908	118	17,085
1909	123	23,469
1910	110	27,257
1911	162	57,203
1912	206	63,772
1913	167	23,752
1919	372	164,030

The mining and quarrying and the textile industries accounted for 6,096 and 3,114 respectively of the workpeople affected in 1908, for 6,456 and 2,846 of the workpeople affected in 1909, for 21,103 and 2,388 in 1910, for 34,417 and 9,089 in 1911, and for 38,470 and 5,856 in 1912. In 1913 the textile industry accounted for 10,158 of workpeople affected, and in 1919 the mining and quarrying industry for 99,035 of the workpeople affected. The causes of the disputes during the period 1908-13 were mainly questions of wages, 52% of the workpeople being involved on this account. Of the total number of strikes during the same period 13% ended in favour of the workpeople, 59% ended in favour of the employers, and 28% resulted in a compromise.

*Holland.*—Statistics of disputes in Holland are published by the Central Statistical Bureau. The figures for the years 1907-19 are given in the table below:—

Year	Number of Disputes	Number of Workpeople directly affected	Aggregate Duration in Working Days
1907	154	15,154	4,366,691
1908	135	7,105	91,860
1909	189	8,455	272,013
1910	146	13,238	334,595
1911	217	20,005	435,992
1912	283	21,672	367,751
1913	427	30,161	787,876
1914	271	25,569	361,400
1915	269	15,179	165,247
1916	377	18,127	249,442
1917	344	31,317	526,507
1918	325	39,640	607,236
1919	649	61,667	1,051,884

During the period 1911-5 the proportion of disputes due to questions of wages was 55%; it was 58% in 1916, 55% in 1917, 57% in 1918, and 58% in 1919. The results of the disputes during the period 1910-9 were as follows:—22% ended in favour of the workpeople, 28% ended in favour of the employers; 44% were compromised; and 6% were either indeterminate or the result unknown.

*Sweden.*—The Swedish labour department has published statistics of strikes and lock-outs since 1903. Figures for 1908 to 1919 are shown below:—

Year	Number of Disputes	Number of Work people directly affected
1908	302	40,357
1909	138	301,749
1910	76	3,671
1911	98	20,576
1912	116	9,980
1913	119	9,591
1914	115	14,385
1915	80	5,119
1916	227	20,711
1917	475	46,701
1918	708	61,223
1919	440	81,041

Of the disputes recorded during the period 1910-9, 63% were caused by questions of wages. In the same period 28% of the disputes were settled in favour of the workpeople, 28% in favour of the employers, and 42% were compromised.

*Spain.*—Statistics of strikes are published annually by the Spanish Institute of Social Reforms. The figures for 1905-18 are given below:—

Year	Number of Strikes	Number of Work-people directly affected
1905	130	20,176
1906	122	24,394
1907	118	12,671
1908	127	12,748
1909	78	6,683
1910	151	35,897
1911	118	22,154
1912	169	36,306
1913	201	84,316
1914	140	49,267
1915	91	30,591
1916	178	96,882
1917	176	71,440
1918	256	109,168

Questions of wages were the main causes of 48% of the strikes during the period 1910-8. In the same period 32% of the strikes terminated in favour of the workpeople, 34% in favour of the employers and 34% were compromised. In 1918, 29% of the workpeople directly affected were employed in agriculture and cattle breeding, 11% in the textile industry, 10% in the mining industry, and 9% in both metal and engineering and clothing trades.

#### (C) BRITISH DOMINIONS

*Canada.*—Statistics of disputes are published by the Department of Labour. The following table shows the number of disputes, the number of workpeople involved and the aggregate duration in working days during the years 1908-19:—

Year	Number of Disputes	Number of Workpeople directly or indirectly affected	Aggregate Duration in Working Days
1908	68	25,293	708,285
1909	69	17,332	871,845
1910	84	21,280	718,635
1911	99	30,094	2,046,650
1912	150	40,511	1,099,208
1913	113	39,536	1,287,678
1914	44	8,678	430,054
1915	73	9,140	106,149
1916	75	21,157	208,277
1917	148	48,392	1,134,970
1918	196	68,480	763,241
1919	298	133,988	3,942,189

Of the 449 disputes recorded during the period 1911-5, 128 occurred in the building trades, 103 in the metal trades, 51 in the clothing trades, 39 in the general transport trades and 29 in the mining industry. The majority of the disputes during the same period were due to questions of wages and hours, about 70% of the disputes being due to this cause. With regard to the results of the disputes during this period 139 or 30% resulted in favour of the workpeople, 164 or 36% in favour of the employers, 79 or 17% were compromised and in the remaining 67 cases the result was indefinite.

In 1919 the industry most affected by disputes was the metal and engineering, in which there were 45 strikes, involving 70,268 workpeople and a time loss of 1,993,704 working days. Forty

strikes, involving 10,779 workpeople and resulting in a loss of 287,146 working days, occurred in the building trades. Of the 298 disputes recorded in 1919, 223 were due to wages. In the same year 157 of the disputes terminated in favour of the workpeople, 88 in favour of the employers and 23 were compromised.

*Australia.*—The systematic collection of statistical data regarding strikes and lock-outs in Australia was initiated by the Commonwealth Bureau of Census and Statistics at the beginning of 1913.

The following table shows the number of strikes and the number of workpeople directly and indirectly affected in the years 1913-9:—

Year	Number of Disputes	Number of Work-people affected
1913	208	50,283
1914	337	71,049
1915	358	81,292
1916	508	170,683
1917	444	173,970
1918	298	56,439
1919	460	157,591

In 1919 the total number of working days lost on account of strikes and lock-outs was 5,652,726. (J. H.)

#### (D) UNITED STATES

In Nov. 1909, more than 25,000 shirt-waist makers struck in New York City; in July 1910 the cloak and suit makers in the same city; and in Oct. the men's clothing workers in Chicago. These strikes were remarkable for the numbers involved, and for the plans of adjusting grievances which resulted.

The joint agreement of the bituminous mine operators with the United Mine Workers expired April 1 1910. Disagreements as to district boundaries prevented its renewal without friction. On April 1 about 300,000 miners struck. In most districts the operators soon granted the wages increases demanded. Some 45,000 miners remained out. In July the union concluded an agreement with the remaining operators, only to have it rejected by referendum of the strikers. The miners returned to work in Sept.; the union had paid out \$674,216 in strike benefits. The same year, in Columbus, O., the street-railway employees struck three times, in April, May and July, because of discharges of union members. The state Board of Arbitration considered the company responsible. The strikes were marked by violence; much of the company's property was destroyed and a number of lives were lost. Twice the militia were used to restore order.

In 1912 there were strikes led by the Industrial Workers of the World among the silk workers of New Jersey, the lumbermen in Louisiana, and the textile workers in Lawrence, Mass. (See TRADE UNIONS.) The Lawrence strike lasted for nine weeks and affected 12 mills. On Jan. 11 about 14,000 employees walked out, and during the strike the number increased to 23,000. The cause of the strike was the announcement by mill owners, when the state law went into effect limiting the hours of women and children to 54 a week, that the reduction in hours would not be accompanied by an increase in the hourly rates of pay. At the beginning of the strike only a small number of the operatives were organized; the paid-up membership of the I.W.W. in Lawrence was not more than 300. During the strike the I.W.W. claimed 14,000 members; but the next year the membership had dwindled to one-half. Violent acts by strikers, greatly exaggerated by the press, and violent acts by deputies, police and militia, scarcely mentioned by the press, embittered the struggle. Early in the strike Haywood, Ettor and Giovannitti, I.W.W. organizers, went to Lawrence. Their coming resulted in a reduction of violence, for they preached passive resistance; however, threats to prevent strikebreakers from working probably continued. A business man of Lawrence, not connected with the strikers, was arrested and fined for placing sticks of dynamite in various parts of the town, presumably to discredit the strikers. The American Federation of Labor contributed \$11,000 to the strike relief fund, the Socialists \$40,000 and the I.W.W. \$16,000. Two hundred children of the strikers were sent to New York to be fed by other workers in order that their parents might hold out longer. Ettor and Giovannitti were arrested in connexion with the murder of a woman, and used their trial for propaganda. The I.W.W. urged a general boycott of Lawrence. As a result of the strike 30,000 employees received wages increases of from 5%

to 20%, and an increased rate for overtime. The largest increases were given to the unskilled workers.

The anthracite coal strike, beginning March 31 1912 lasted seven weeks. About 170,000 men and boys were out. The results were wages increases, abolition of the sliding scale and provision for a grievance committee. A strike of the coal-miners of Paint Creek and Cabin Creek in W. Virginia lasted from April 1912 to July 1913, and was marked by violence and lawlessness. Thirteen lives were lost. It has been estimated that the employers lost \$2,000,000 because of the strike, the strikers \$1,500,000 in wages and that the strike cost the taxpayers of the state or county \$500,000. Miners in other states contributed \$602,000 to the strike fund. The U.S. Senate ordered an investigation.

In 1913 business was active, the cost of living was rising, and there were many strikes. A strike of silk workers in Paterson, N.J., beginning in Feb. involved 293 establishments and over 25,000 workers. The strike was in protest against the introduction of the three- and four-loom system, and to enforce shorter hours and increased wages. After the strike began, the I.W.W. sent in their leaders. They succeeded in holding the workers together during the five months of the strike. The attempt by the American Federation of Labor to organize the workers and effect trade agreements with the employers failed. The strike was lost through exhaustion of the workers. A strike in the copper mines of upper Michigan, for recognition of the Western Federation of Miners and to compel the enforcement of certain state laws, began in the summer of 1913 and lasted until April 1914. The men were taken back with the promise of wages increases and reduction of hours, but on condition that they give up membership in the union.

In Sept. 1913 a strike broke out among the employees of the Colorado Fuel and Iron Co. for recognition of the United Mine Workers' Union, wages increases and the enforcement of state mining laws. In Dec. a Federal grand jury indicted many of the union officials for violating the anti-trust Act by trying to create a monopoly of labour. Mine operators were also indicted for violating state mining laws. In Jan. 1914 the Federal House of Representatives ordered an investigation. Early in the strike the state militia had been sent in and martial law declared. Both sides were guilty of violence. The strikers had moved from the houses owned by the company to tent colonies on land leased by the union. One of the largest of these was at Ludlow. On April 20 1914 militia fired into the tents, which were ignited, and 7 men, 2 women and 11 children perished. Each side accused the other of initiating the attack. John D. Rockefeller, Jr., on behalf of the employing company, refused to go to arbitration with the union, which he believed to be controlled by eastern agitators. President Wilson then sent 2,000 Federal troops to restore peace. They took the place of the militia, who withdrew, and disarmed the strikers and mine guards and deported the strikebreakers. In Sept. President Wilson proposed that the company should take back the strikers not guilty of violence and establish grievance committees and a committee of appeals to effect arbitration. The proposal was accepted by the miners but rejected by the operators. Early in Dec. 1914 the President appointed a commission to settle future disputes in the Colorado mines, made up of representatives of the employers, the union and the public. The union then voted to call off the strike and on Dec. 30 part of the Federal troops were withdrawn. At no time during the strike did the directors of the company visit the property, but after investigation by the U.S. Commission on Industrial Relations, John D. Rockefeller, Jr., visited Colorado. The result was the introduction of a system of employee representation. The miners voted to accept the plan, which provides for annual election, by the workers in each camp, of representatives to meet in conference with the employers' representatives. Each district conference names committees on conciliation, safety, sanitation, health and housing, education and recreation. A supervisor of welfare work was appointed. The workers were granted the basic 8-hour day and check-weighmen. A promise was given that union men would not be discriminated against, but the union was not recognized.

A lock-out of 16,000 coal-miners in Ohio which lasted more than a year was settled in May 1915, by Federal mediation. For a year after the war broke out in Europe, business was depressed in the United States, and many workers were competing for employment; but with increasing demand for labour on war contracts strikes again became numerous. In 1915 there were 102 strikes and 6 lock-outs of machinists in the four months July to Oct.; in nearly every case the basic 8-hour day was gained. In 1916 there was rioting in connexion with strikes in the oil refineries at Bayonne, N.J., of iron and steel workers in East Youngstown, O., and of 30,000 workers of the Westinghouse Electric Co. in Pittsburgh. Unorganized iron miners on the Mesaba range in Michigan were on strike from June to October. In the same year there were also strikes of longshoremen on the Pacific coast, and street railway employees in several cities. Coal strikes affected 350,000 men. Some 10% of the strikes that year were in New York City where more than 300,000 workers were out, chiefly in the garment trades.

After the United States entered the war the American Federation of Labor discouraged strikes in essential industries. Disputes were settled by negotiation. A number of strikes did occur, however, in some cases involving large numbers of workers; the great majority were settled by Government committees. Those responsible for war labour administration were of the opinion that the period of the war should be one of truce in the industrial field. Demands for closed shop or for radical social change were barred. The truce was not always respected by workers or employers, but on the whole it was adhered to. Local machinists' unions in Bridgeport and Newark came under radical socialist leadership. As many of the Allies' war orders were placed in Bridgeport there was great demand for machinists and the town became overcrowded. The men were dissatisfied because their pay was lower than that of men in the shipbuilding yards, and because employers discriminated against the unions. In the summer of 1917 the men demanded the 8-hour day, 10% increase in wages with certain minimum rates of pay for each class of workers, right of union membership and shop committees for the adjustment of grievances. The answer of the employers was to ask the U.S. attorney-general for criminal action. Various Federal agents were sent to Bridgeport but were unsuccessful in preventing the strike which occurred in May 1918. The strikers, however, were persuaded by the Federal mediator to return to work. Hearings were held in Washington before a special board of the Ordnance Department, and on June 8 the award was made public. After some protest the workers accepted it, but the employers refused, with the result that the men again went out on strike June 26. The War Labor Board took up the matter, but unsuccessfully, an umpire was appointed, who granted the 8-hour day, arrangements for collective bargaining, and wages increases for the most poorly paid workers; but not classification of workers with minimum wage rates. The men felt that the Government should have sustained its earlier award, and they refused to accept the second, which seemed to them to be a compromise with the employers. A third time they went out on strike. President Wilson then wrote to the strikers threatening that unless they returned to work immediately, they would be refused employment in any war industry in their community, they might not claim draft exemption on the grounds of employment in an essential industry, and that the U.S. Employment Service would refuse to find them work in other localities. On Sept. 17 1918 the men voted to return to work. The President also required the employers to reinstate all strikers. The collective bargaining machinery provided by the award never functioned.

In the summer of 1917 the entire lumber industry of the north-west was disorganized by strikes. The chief demand was for the 8-hour day. The President's Mediation Commission was unsuccessful in its attempt to settle the difficulties. The employers continued the 10-hour day, but they had difficulty in keeping men, and those who did accept employment practised sabotage. In the shipyards workers refused to handle "10-hour lumber." These conditions continued until Col. Brice P. Disque, sent into

the field by the "spruce division" of the War Department, effected the organization of the Loyal Legion of Loggers and Lumbermen made up of both employers and employees and with the aim of improving conditions by mutual agreement. Members signed a pledge of loyalty to the U.S. Government. On March 1 1918 the employers introduced the 8-hour day without reduction of wages. A sanitary survey of the camps was instituted, and other improvements in living conditions were made. Labour turnover decreased and output increased considerably. Although at first it had aroused suspicion, the organization won support of most of the employers and men, but both A. F. of L. unions and I.W.W. continued to oppose it.

In many places the public, in sympathy with the employing interest and angered by the philosophy of the I.W.W., attempted to prevent strikes by arresting labour organizers as these came into a locality. Some were thrown into jail and sometimes kept there for long periods without trial. Among the strikes in connexion with which violence occurred were those of the miners in Arizona, in 1917, who struck near Jerome (May) and Bisbee (June) and also in two other districts. The chief demands were for higher wages and grievance committees. Mine owners charged the I.W.W. as responsible, although an A. F. of L. international union was actually in charge of the strike. About 100 miners were deported from Jerome by the employing interests, in cattle-cars. The train was turned back at the California state line, and the men were kept in jail for three months. On July 12 1917 in Bisbee, 1,200 strikers were dragged from their beds by armed citizens, compelled to march, and then confined in a ball-field and loaded on cattle-cars. The train was sent through the desert until taken over by soldiers camped at Columbus, N.M. Here they lived on army rations for three months, and then scattered. One-third of these men were members of the I.W.W. In July 1919 county officials arrested 107 men, prominent citizens of Bisbee, charged with kidnapping and assault, in connexion with the deportations of two years before. Civil suits for damages were filed against mining companies and the railways by the men who had been deported; these were settled out of court.

In the six months following America's entrance into the war 3,000 strikes were reported; in the first six months of 1918 the number was 1,771. When the Armistice was signed, the War Labor Board had on hand several hundred cases awaiting hearings. Now that the national emergency had passed, many employers and employees ceased to coöperate. Strikes began again. As in 1916 and 1917, the greatest number of strikes in 1918 and 1919 were in the metal trades, building, clothing, textile, transportation and mining. The largest number of workers in any one strike in 1916 was 60,000, in the men's clothing strike in New York; in 1917 no strike involved as many as 40,000; in 1918, 60,000 machinists were on strike in northern New Jersey. The strikes of 1919 were remarkable for the number of workers included; the total number was reported to the Bureau of Labor Statistics as 4,112,507. Not many strikebreakers were employed; the labour reserve was still depleted owing to business prosperity of the war period. Many of the larger strikes occurred in New York City and its vicinity; 176,000 struck in the clothing trades; 150,000 textile workers in New Jersey and New England; 16,000 marine workers struck in New York harbour in Jan.; 17,000 in March; and 20,000 longshoremen in March. In July 40,000 marine workers of the Atlantic coast struck; 100,000 were out sometime during the year. In 1919, also, 65,000 struck in the stockyards in Chicago; 100,000 in the shipyards of New York and vicinity; 151,000 in the New York building trades; 43,000 anthracite miners in Pennsylvania.

After the Armistice, war labour adjustment boards, one after another, were dissolved. Workers who had been prevented from striking by the promise of peaceful settlement of grievances, felt that the Government and employers had broken faith. The result was widespread unrest, and a number of spontaneous strikes by the rank and file of union membership, not authorized by the union officials. Demands both for the closed shop, and for the open shop were pushed without thought of compromise. Employers discriminated against union men, and recourse was

had to force. In accordance with a resolution of the convention of the A. F. of L. in June 1918, the 24 international unions which claimed jurisdiction over the trades in the steel industry co-operated to organize all the workers in that industry. Mass meetings were held in Sept. in mill towns. The companies replied by discharging union members; the U.S. Steel Corp. ignored the request of President Gompers of the A. F. of L. for a conference. On July 20 1919 the committee of the 24 unions decided to submit a strike vote to their membership. Twelve demands were made. The real issue was recognition of the union. Wages in the industry were high, but the hours long. In 1911 the stockholders of the Steel Corp. had ordered an investigation of conditions of work. The report showed that 50% to 60% of the employees in rolling-mills, open hearth and blast furnaces worked a 12-hour day. The committee recommended a reduction in hours, but the recommendation was quashed by the finance committee. In Sept. 1918 the basic 8-hour day was granted, which resulted in increased pay, not shorter hours. The communities in which steel workers lived were ruled politically by company influence. In W. Pennsylvania organizers were denied free speech and assemblage by local authorities. The unions voted to strike. The call to strike on Sept. 22 1919 was published in seven languages, to all workers in iron and steel mills and blast furnaces not bound by trade agreements. The companies prepared for battle. At McKeesport alone 3,000 citizens were sworn in as special police subject to instant call. The mills of the Pittsburgh district were fortified and provisioned. On Sept. 21 rioting and arrests began. The next day 365,000 men stayed away from work. The state constabulary were sent in. Gradually the men went back to work. On Jan. 8 1920 the national committee for organizing the workers permitted the 100,000 men still out to return to the mills. Those who were taken back were required to give up their union cards. The national committee reported that 156,702 union members paid initiation fees between Aug. 1 1918 and June 31 1920, and estimated at 250,000 the total number organized.

February 6 to 11 1919 there was a general strike in Seattle Wash., involving 60,000 persons, in sympathy with shipyard employees who were striking for an increase in pay. The general strike was carried out by craft unions of the A. F. of L., although I.W.W. propaganda in the interest of industrial solidarity may have helped to put the workers into the spirit for such a mass demonstration. On the first day 110 unions stayed out; some workers had permits from the strike committee to work in the interests of public health and safety; garbage was collected and milk was delivered to distributing stations. A Labour guard patrolled the streets to preserve order. The business men viewed the strike as a "revolution." The mayor announced that unless the strike were called off on the morning of Feb. 8, he would declare the city under martial law. This threat was not carried out, although citizens armed themselves, and the governor sent troops and machine-guns. On Feb. 11 the strike was called off. Workers had been returning, indeed, since the second day and a month later all were back, without wages increases.

The New York harbour strike of Jan. 1919 arose spontaneously as the result of local initiative and comprised practically all the 16,000 or 17,000 men employed on harbour craft. As a result 50,000 longshoremen also were idle. The harbour had been the scene of industrial dispute since 1917. The immediate cause of the 1919 strike was the refusal of the employers to appear for arbitration before the War Labor Board to which the men had appealed for the 8-hour day and increased pay. The employers were persuaded by President Wilson to accept arbitration, and the men returned to work. The award did not provide for the 8-hour day, and the men struck again. The Railroad Administration then made concessions to the men on boats, and they returned to work. Other Government employees followed, and by April the private employers settled for the original 10-hour day but with wages increases. On Oct. 7 the railway men struck again. The longshoremen joined them, against the orders of their national officials. They wanted increased pay; the strike dwindled away and was over by November.

In Aug. 1910, although forbidden by their national officers, the railway shopmen called a strike because of the delay of the Wage Adjustment Board to reach a decision on the demands of the men for increased pay. The strike began in Chicago and spread to New York and Boston; 250,000 men went out. After six days the strike was called off and the men returned to work. At the request of President Wilson the demands for wages increases were postponed. Other strikes not authorized by national officers of the union were those of employees of the General Electric Company in four cities in 1918 and of the New York local of the International Typographical Union in 1919. For 1917, 72 "unauthorized strikes" were reported, 58 for 1918, and 125 for 1919. Those in 1919 involved 1,053,256 strikers.

In Nov. 1919 435,000 bituminous coal-miners struck for wages increases of 60%. They also demanded the 6-hour day, and the 5-day week in order to distribute the work through the year. The miners at first refused to arbitrate the dispute as they feared the delay would give advantage to the employers. An injunction was issued to prevent the use of union funds for strike benefits. An award of an impartial committee was accepted in March 1920, which granted an average of 27% increase in wages, but the 8-hour day was retained.

About 93% of the policemen of Boston struck in Sept. 1919 for the right to organize and affiliate with the American Federation of Labor. The city was subject to rioting and crime until the National Guard restored order. President Wilson declared a police strike to be a crime against civilization. The police commissioner filled the places of the strikers with other men. In Aug. 1919 there was also an actors' strike, in which the stage hands and musicians joined in sympathy. An "outlaw" strike on the railways in April 1920, due to the delay of the President in appointing the Labor Board provided by the Transportation Act, was opposed by the brotherhoods. In 1919 and 1920 there were strikes on the Brooklyn Rapid Transit road, and in 1919 also on the Interborough Rapid Transit of New York.

A strike and lock-out in the men's clothing industry in New York of six months' duration was settled June 2 1921. The settlement may be regarded as a victory for the union, and for the principle of trade agreements. Since Sept. 1920 negotiations had been carried on between the employers' association and the union. Business depression gave an advantage to the employers, for whom a lock-out would not mean such a loss as if it had come a year earlier. On Dec. 2 the employers presented an ultimatum to the union stating that unless piece work, a reduction in wages and the employer's full control of employment and discharge were accepted before Dec. 6 the manufacturers would put their own programme into effect, regardless of the decision of the impartial board. The union rejected the ultimatum. The reply of the employers was an announcement that the impartial machinery had ceased to function. Stoppages of work by employees and lay-offs and shut-downs by employers followed. By Dec. 13 the union instituted picketing. An offer of mediation by the state Industrial Commission was accepted by the union, but rejected by the manufacturers. The manufacturers' association resigned from the national federation. In Jan. 1921 one of the employers began suit for an injunction against picketing, \$500,000 damages, and dissolution of the union because of its alleged revolutionary character. The suit for dissolution was dismissed on March 29. By March 27, 425 shops had reopened under agreements with the union, so that 25,000 of the 60,000 clothing workers were again at work. On April 5 the union announced that \$1,000,000 had been raised toward their defense fund. Early in May certain of the employers resigned from the association, and the remainder reached an agreement with the union, by which the bargaining machinery with the impartial chairman was reinstated. The workers accepted a 15% cut in wages. The union brought suit for \$1,000,000 damages against the employers on the charge of attempted boycott of union members.

**STRYPA-CZERNOWITZ, BATTLE OF.**—The fighting in the area between the River Strypa and Czernowitz (the capital of the Bukovina) in the winter of 1915-6 comprised an important series of operations on the eastern front between Russia and the Central Powers.

In the middle of Nov. 1915 the fighting activity in the Russian theatre of war had died down (see EASTERN EUROPEAN FRONT CAMPAIGNS). Both for Austria-Hungary and for Germany the war against Russia became of secondary importance in proportion as the war of annihilation against Serbia progressed. The Central Powers had for the moment no offensive in view against Russia, who was exhausted after the heavy fighting which had gone before. Both belligerents now settled down to a war of position, which enabled them to restore their armies. This lasted until Christmas.

In the middle of Dec., Ivanov, who was in command of the Russian S.W. front, prepared for a new great offensive. This was, no doubt, with the view of raising their fallen prestige and regaining the confidence of the wavering Balkan States; above all to relieve Montenegro, whose overthrow by Austria-Hungary was imminent; and not least to serving the advantage which a Russian victory would have in influencing Rumania, which was still vacillating, to join in against the Central Powers.

Three Russian armies—the VIII. under Brussilov, the XI. under Shtcherbachev and the IX. under Lechitski, with 32 infantry and 13 cavalry divisions as well as some *Reichswehr* formations—attacked the Austro-German front S. of the Polesic in E. Galicia and in the Bukovina. From N. to S. there stood opposed to the Russians the main body of Linsingen's group of armies, Böhm's group of armies and Bothmer's and Pflanzer-Baltin's armies, counting roughly 40 infantry and 13 cavalry divisions. The approximate strength expressed in rifles was in the proportion of 450,000 Austro-Hungarian to 480,000 Russian. The Austro-Hungarian infantry divisions were on a lower establishment than the Russian.

Whereas on the N. wing and in the centre no particular actions took place, the main attack, assigned by Ivanov to Lechitski's and Shtcherbachev's armies, was delivered against Pflanzer and Bothmer on a front stretching from the Rumanian frontier to Burkanów on the Strypa. The main burden of the attack fell on Pflanzer-Baltin's army, which was fighting with 8 infantry and 5 cavalry divisions against the Russians' 10 infantry and 6 cavalry divisions.

Not without reason had the Russians selected the S. wing as the point of attack. A success which should give them back the capital of Bukovina could not have failed in its effect on Rumania. And besides, an advance into Bukovina was the shortest cut to the Carpathians, the reacquisition of which was among their most cherished ambitions. They hoped, by defeating Pflanzer's army, to roll up Bothmer's and Böhm's fronts.

The preparations for the attack on the Bessarabian front had been evident since the middle of December. Lechitski had during that month assembled 4 corps in front of Pflanzer's S. wing between the Pruth and the Dniester. A sharp watch was kept on this section by the XI. Corps under von Korda, general of infantry, with 3 infantry divisions and 1 of cavalry. Pflanzer was prudently preparing for the anticipated attacks by organizing the positions so strongly as to compensate for the deficiency in numbers. Reinforcements did not arrive until later.

On Dec. 23 an attack on Papp's brigade was repulsed with heavy Russian losses. In the following days small enemy attacks multiplied themselves at numerous points of the front. On the 26th heavy artillery fire began, and on the morning of the 27th, heralded by a heavy bombardment from at least 200 guns, the Russian mass attack was launched on the Bessarabian frontier

and to the N.E. of Zaleszczyki, having as its centre of gravity the positions N. of Toporowce. In the afternoon also the Russians flung themselves six times on the Austro-Hungarian positions, 15 or 16 rows deep, but in vain. They were driven back with heavy losses either by artillery fire or in hand-to-hand fighting.

On the 28th they repeated their ruthless attacks, which, as at Toporowce and Bojan, became exceedingly violent. The S. wing of the S. army was attacked on the same day by the Russian XI. Army, now commanded by Gen. Sakharov in place of Shtcherbachev. At Burkanów an Austro-Hungarian outpost on the Mogila height had to be brought back to the main position. On the 29th the battle reached its height. Not only the XI. Corps but also the VI. Corps and the 36th Inf. Div., defending the heights on the E. bank of the Strypa, were furiously attacked.

The Russians had brought up fresh forces from Odessa and Kherson for the attack on the N. wing of Pfanzner's army. The Russian VII. Army, with 5 to 6 divisions of the Caucasian V. Corps and the II. Army Corps, pushed in between Lechitski's and Sakharov's armies, and in addition the II. Cav. Corps came over from Lechitski's S. wing. Considerably reinforced by these new forces, Ivanov continued to bring fresh masses into the attack on the Austro-Hungarian VI. Corps and the 36th Inf. Div. But as on the previous days all these attacks, courageous as they were, broke down. Sakharov's S. wing met with the same fate in attacking the Burkanów bridge-head. Here the 132nd Inf. Bde. of Hoffmann's Corps heroically repulsed one onslaught after another and brought 900 prisoners behind the lines, leaving as many Russian corpses in front of the obstacles.

On the 30th and 31st the Russians, after hours of preliminary bombardment, renewed their attempts to break through opposite the VI. Corps. But Arz, reinforced by the 38th Honved Inf. Div. which had been brought up from the S. army, repulsed all the assaults. On the 31st the Russians, having had no success, and considerably weakened by their enormous losses, withdrew in the evening. On the Dniester front and the Bessarabian frontier they confined themselves on both days to moderate artillery fire, being greatly exhausted by the preceding days. On the II., I. and IV. Army fronts also, only artillery duels took place.

On New Year's eve and the morning of Jan. 1 1916 the attacks on Pfanzner's S. wing in Bessarabia increased in intensity. But Korda repulsed all the Russian IX. Corps attacks in hand-to-hand fighting, with the help of the 9th Inf. Bde., which had come up from the Italian theatre. In the afternoon 6 Russian infantry regiments returned to the assault at Rarancze, and succeeded in forcing back the Austro-Hungarian position by about 300 paces on a breadth of 1,200 paces. A counter-attack was at once put in hand, but could not penetrate owing to renewed Russian attacks. Arz's and Bothmer's S. wing, which was attacked by the Russian XXII. Corps at Sokolov, repulsed all attacks on New Year's day.

On the 2nd the Russians repeated their efforts to break through at Rarancze, but failed in each case. But in view of the Russians' superior numbers, the Austro-Hungarian higher command renounced the idea of winning back the lost position.

On the 3rd and 4th the battle burst forth again on the Dniester front. At Toporowce and Rarancze furious fighting again took place. But the Russians' efforts remained fruitless, their attacks being frustrated by the striking bravery of the defenders in close fighting. Here the brave Croats of the 16th Inf. Reg. played a most glorious part. At Ocna, too, and at the bridge-head of Michalcze, N.W. of Uscieczko, the front and flanks of which were already surrounded by the Russians, all attacks were untiringly repulsed. On the 5th, after these assaults, a short lull set in once more in E. Galicia and on the Bessarabian frontier.

On Jan. 7, the Russian Christmas Day, which was also the opening day of the attack on Montenegro, the Russian storm-masses again attacked the VII. Army. At Dobropole a counter-attack by the 12th Inf. Div. drove the troops of the 3rd Turkestan Div. out of a captured line of trenches. At 11 A.M. the Russians opened a heavy bombardment on the Korda's XI. Corps, following it up at one o'clock with an infantry attack on the Toporoutz and Rarancze positions. But this again brought no success.

On the 8th, 9th and 10th, it seemed as if the Russians had again to pause and take breath. Austro-Hungarian airmen reported the approach of new Russian reinforcements opposite the N. wing of Pfanzner's army. On all these three days, however, the Russians continued to fire on the positions. On the 10th the firing at Toporowce and Rarancze became considerably more vigorous, and when it reached its greatest intensity on the 11th, and finally resolved itself into a bombardment, Korda again prepared for a most determined resistance. From three o'clock in the afternoon until ten in the evening, the Russian masses stormed the Austro-Hungarian positions unceasingly in the attempt to break through. But each new attack ended in a precipitate retreat, thanks to the excellent artillery defence.

Pfanzner's front had meanwhile been reinforced by the 40th Honved Inf. Div., the 2nd Cav. Div. and the 24th Inf. Division.

It was not until the 13th that the Russians girded themselves for a fresh attack. With their divisions filled by fresh troops, they launched against Korda's positions eight violent assaults before the evening of the 14th, but were obliged to retire each time with heavy losses. This was their last effort. Their strength seemed broken, and on the 15th, except for some firing on the positions, there was peace.

The failure of the Russian attacks, and the cessation of hostilities against Montenegro which followed on the 17th, indicated the close of the New Year's battle. There were still a few isolated attacks in the next few days, but the need for rest on both sides brought about a speedy return to the war of positions. The embittered attacks of the Russian S. army persisted with only a few intervals for 24 days, ending in a complete victory for Austria-Hungary along the 130-km. battle-front of the VII. Army. At Rarancze only was a small portion of the front given up, whereas the Russian masses paid heavy tribute before the strong Austrian positions.

Thus the Russians failed to achieve their great aims. Their offensive was not able to save Montenegro from her fate, the Austro-Hungarian front had not been forced back, and the failure of the attack, which cost the Russians at least 170,000 dead and wounded and 6,000 prisoners, could not definitely influence Rumania's policy. (E. J.)

**STUART, JAMES** (1843-1913), British educationist and politician, founder of the university extension movement, was born at Balgonie, Fife, Jan. 2 1843, the son of Joseph Gordon Stuart, a manufacturer. He was educated at St. Andrews and at Trinity College, Cambridge, where he was third wrangler in 1866. In 1867 he was elected a fellow of Trinity, and became a mathematical tutor. The same year he lectured in astronomy to women teachers at Liverpool, and such was the success of these lectures that he was invited to repeat them at other centres. From this small beginning arose the university extension movement, which, though undertaken at first merely as an experiment, has now attained a very great success. In 1875 Stuart became first professor of mechanism and applied mechanics at Cambridge, and in this capacity was responsible for the organization of the university workshops and the teaching of engineering generally. In 1882 he unsuccessfully contested Cambridge University as a Liberal, but in 1884 was elected for Hackney. He held this seat till 1885. From 1885 to 1900 he was member for Hoxton and from 1906 to 1910 member for Sunderland. He was created a privy councillor in 1909. For many years he was a Progressive member of the London County Council, and was also interested in the management of the *Star* and the *Morning Leader*. Stuart married in 1890 Laura Elizabeth, the daughter of J. J. Colman, head of the great firm of mustard manufacturers, and became a director of the firm in 1898. He died at Norwich Oct. 13 1913.

**STUART, RUTH MCENERY** (1856-1917), American writer, was born in Avoyelles parish, La., in 1856. She was educated in private schools in New Orleans and in 1879 married Alfred C. Stuart, a planter. Her first story, *Uncle Mingo's Speculations*, appeared in 1888 in the *Princeton Review*. She moved to New York City in 1891 and soon became known for her stories of negro life in the South. She also wrote much verse for magazines.

She often appeared as a public reader of her own works, which were characterized by humour and pathos. Tulane University, New Orleans, conferred upon her in 1915 the degree of Litt.D. She died in New York City May 6 1917.

Her numerous books include *Carlotta's Intended* (1894); *Sonny* (1896); *In Simpkinsville* (1897); *Moriah's Mourning* (1898); *Napoleon Jackson, the Gentleman of the Plush Rocker* (1902); *The Second Wooing of Salina Sue* (1905); *Sonny's Father* (1910); *The Unlived Life of Little Mary Ellen* (1910); *Daddy Do-Funny's Wisdom Jingles* (1913) and *Plantation Songs and Other Verse* (1916).

**STUBBS, CHARLES WILLIAM** (1843-1912), English divine, was born at Liverpool Sept. 3 1843, and educated at the Royal Institution school, Liverpool, and Sidney Sussex College, Cambridge. His father and grandfather were Yorkshire agriculturists, and throughout his life he took a strong interest in the welfare of the agricultural labourer, publishing three volumes on the subject, *Village Politics* (1878), *Christ and Democracy* (1883) and *The Land and the Labourers* (1890). He was a strong Liberal with somewhat socialistic views, and was preferred by Mr. Gladstone to the living of Stokenham and Chivelstone in Devon in 1884. In 1887 he was transferred to Liverpool, becoming rector of Wavertree. In 1893 he became dean of Ely, remaining there till 1905, when Sir Henry Campbell-Bannerman nominated him to the bishopric of Truro. He was Hulsean lecturer at Cambridge in 1904, and published his lectures under the title *The Christ in English Poetry* (1905). His other works include *A Creed for Christian Socialists* (1896); *Charles Kingsley and the Christian Social Movement* (1898) and a *Handbook to Ely Cathedral* (1898). He died at Truro May 4 1912.

**STURDEE, SIR FREDERICK CHARLES DOVETON**, 1ST BART. (1859- ), British Admiral, was born at Charlton, Kent, June 9 1859, the son of a naval officer, and entered the navy in 1871. He was promoted lieutenant (1880), commander (1893), captain (1899), rear-admiral (1908), vice-admiral (1913), admiral (1917) and admiral of the fleet (1921). He saw service in Egypt (1882) and in Samoa (1898-9) when he was in command of the Anglo-American force. He was assistant-director of Naval Intelligence to the Admiralty (1900-2) and chief of staff, Mediterranean Fleet (1905-7) and Channel Fleet (1907). In 1910 he became rear-admiral of the first Battle Squadron, and commanded the 2nd Cruiser Squadron (1912-3). During the World War he was commander-in-chief, on the "Invincible," of the squadron which won the battle of the Falkland Is., Dec. 8 1914, and he took part in the battle of Jutland. He was created K.C.B. (1913), and K.C.M.G. (1916); and a baronetcy was conferred on him in 1916, with the title "of the Falkland Is." In 1918 he became commander-in-chief of the Nore.

**STURDZA, DEMETRIUS** (1833-1914), Rumanian statesman (see 25.1051), died in 1914.

**STÜRGKH, CARL**, COUNT (1859-1916), Austrian prime minister from Nov. 3 1911 to the time of his murder, was born on Oct. 30 1859, of an ancient noble Styrian family, and in 1881 he became an official of the Statthalterat at Graz, and later of the Ministry of Education. He left the State service in 1897, when he was elected as a representative of the loyal land-holding interest to the Reichsrat. He attached himself to the Left of the German party, and came forward as a keen opponent of universal suffrage. He was from Feb. 10 1909 to Nov. 3 1911 Minister of Education, and a zealous advocate of the humanistic education traditional in the gymnasia. Stürgkh was one of the committee of five ministers who decided on the dispatch of the ultimatum to Serbia and the declaration of war, which brought on the World War. He was killed on Oct. 21 1916 by a shot fired by the Social Democrat Friedrich Adler, a son of the Social Democrat leader, Viktor Adler, as a protest against Stürgkh's government without parliament. (See AUSTRIAN EMPIRE.)

**STÜRMER, BORIS VLADIMIROVICH** (1849-1917), Russian politician, was born in 1849, the son of an emigrant—his father being captain of a fire brigade at Tula. He studied at the university of Petrograd, and there made friends with Count Bobrinsky, a member of one of the leading Russian families, who introduced him into the upper circle of Petrograd society. His affable manners and his ability to win the confidence of important people

are the only explanation of his brilliant success in a circle to which he did not belong by birth or fortune. He started his career in the Chamberlain's department of the Imperial Court, but he held at the same time different situations in the Senate, the Ministry of Justice and elsewhere. When in 1892 the Government rejected the candidate nominated to the presidency of the executive board of the Tver Zemstvo, Stürmer, whose name was on the list of the Tver gentry, was appointed to this office. It was the first case of a president of the Zemstvo being appointed instead of being elected. In 1894 Stürmer was appointed governor of the Novgorod, and later of the Iaroslavl province. Subsequently he was in charge of a department of the Home Office. In 1904 he was created member of the State Council, but he never took an active part in the legislative work. Meanwhile he won the confidence of the Court, and he was made prime minister in Jan. 1916, at a period when the Emperor, avoiding strong personalities, wished to secure the fulfilment of his orders by devoted servants. As prime minister Stürmer's reactionary attitude provoked a strong opposition in liberal and patriotic circles; rumours accusing him of connexions with Germany were widely spread without real proof. These accusations were finally brought to the tribune of the Duma by M. Milyukov and resulted in Stürmer's resignation in November. After Sazonov's dismissal Stürmer took the portfolio of Foreign Affairs, and his activities in this department resulted in the premature declaration of war by Rumania, so disastrous for that country and for Russia. He was arrested after the revolution, and he died in prison of disease in Sept. 1917.

**STYRIA** (see 25.1058), an Austrian territory bordered on the E. by the Southern Slav State and that part of Burgenland which belongs to Austria; on the N. by Lower and Upper Austria; on the W. by Salzburg and Carinthia; and on the S. by the Southern Slav State. The part of Styria included in the Southern Slav State has an area of some 2,366 sq. m. and had, in 1910, a pop. of 433,000. The Austrian territory extends over some 6,304 sq. m., of which the greater part is mountainous and almost the whole lies in the Eastern Alps. Styria had formerly three large divisions:—Northern or Upper Styria; Middle Styria; and Southern or Lower Styria. Lower Styria and the southern part of Middle Styria, up to the Posruck range and to the Mur have, however, been taken over by the Southern Slav State. Middle Styria is surrounded on the W. and N. by a semi-circular mountain range which joins the Cetic and a part of the Noric Alps and has recently become known as the "Steirische Randgebirge." The pass through which flows the river Mur between Bruck and Graz unites it to Upper Styria. The northern part of Upper Styria is occupied by the heights of the *Nördlichen Kalkalpen*. The eastern part of the Noric Alps, the Bacher together with the Posruck, now belongs to the Southern Slav State.

*Population*.—The pop. of the Styria of to-day was, in 1910, 952,590; in 1920 it had decreased to about 946,720 (151 per sq.m.). It is almost purely German. The proportion of males to females in 1910 was as 1,000 to 983; in 1920 as 1,000 to 1,053. While Styria lost some 75,000 Germans, among whom were 9,000 belonging to the exclusively German-speaking districts, she has now only about 5,000 Slovene inhabitants. In 1910 the pop. of the present-day Styria was as to 97.4% Roman Catholic and 2.1% Evangelical.

For administrative purposes, Styria is divided into 16 districts and the autonomous city of Graz, the capital (pop. 157,032 in 1920). Other important places are:—(pop. figures are taken from the census of 1920) in the Traun and Enns districts of Upper Styria—Bad Aussee (pop. 1,370); Eisenerz (pop. 6,337); Mariazell, the famous resort of pilgrims (pop. 1,881); in the Upper Mur district—Judenburg (pop. 5,668); Fohnsdorf (pop. 7,199); Zeltweg (pop. 3,682); Knittelfeld (pop. 10,672); Leoben (pop. 11,231); Donawitz (pop. 15,087); Vordernberg (pop. 2,352); Bruck an der Mur (pop. 8,490);—in Mürz-Thal—Kappenberg (pop. 12,576); Mürzschlag (pop. 6,483);—in Middle Styria—Köflach (pop. 2,655); Voitsberg (pop. 3,283); Eggenberg bei Graz (pop. 15,554); Weiz (pop. 3,620); Fürstenfeld (pop. 5,649) and the Gleichenberg Spa, Kurort Gleichenberg (pop. 872).

*Education*.—Styria has three higher educational establishments, namely the university and the technical college of Graz and the Montanist College in Leoben.

Notwithstanding the great unevenness of the surface, only 8.0% of the present Styria could be reckoned as unproductive in 1900. Of the productive parts, 19.1% was arable; 0.9% gardens; 0.5%

vineyards; 11.8% meadows; 13.3% grazing lands; 54.4% was, however, forest. This territory is justly called "green Styria." Cattle-raising has greatly developed and farming is actively carried on on the high lands. Nevertheless, in 1918 there were only 358,108 head of cattle (of which 170,630 were milch-cows) and 344,188 swine. A good breed of horses exists in Ennstal and considerable attention is devoted to poultry-farming in Middle Styria, where the shooting and fishing are good. The forests yield a great variety of timber.

**Minerals.**—Styria is so rich in iron ore that it has been called the "land of iron" (*eiserne Mark*). Lignite is also abundant. Of the total output of the mines of present-day Austria (51,000,000 kronen in 1915) 71% (36,000,000 kronen) is attributed to Styria; its output of iron (1.8 million tons in 1915) is over 94% of the Austrian total. Iron-mining is almost exclusively confined to the Erzberg between Eisenerz and Vordernberg. The manufacture of iron in Austria is now almost entirely confined to Styria (538,753 tons out of a total of 541,004 tons). The most important iron-smelting works are in or near the above-named region and at Hiefia, Trofaiach and especially Donawitz; in the lignite districts, in Zeltweg and Knittelfeld, near the lignite diggings of Fohnsdorf and in Eibiswald; also in Mürz-Thal (Kapfenberg, Mürzschlag). The Mürz-Thal is also the centre of the newly created scythe-making industry.

The lignite produced, 1.8 million tons or over 74% of the Austrian total, is found in many places. The most important mines are at Fohnsdorf in Upper Styria; the product of those near Leoben is used by the great metal works of Donawitz and others—and there are smaller mines in Mürz-Thal; in Western Middle Styria in the districts of Hölz and Voitsberg and those of Eibiswald and Wies.

Styria also produces salt; 28,000 tons, some 17% of the whole Austrian output, was obtained near Aussee in 1915. It yields also almost the entire Austrian output of graphite and some sulphur, lead and zinc ores, clay and building stone. The output of magnesite has become especially important; Styria alone almost supplies the world, chiefly from the neighbourhood of Veitsch, Trieben, Kraubath, in the Breitenau near Bruck and elsewhere.

**Water-power.**—The plentiful and accessible supply of water-power has caused the installation of great electrical stations of which, however, full advantage has not been taken. The electrical works of Weiz are world-famed.

**Manufactures.**—Notable Styrian manufacturing industries are those of the iron works at the places already named, also at Pallen-Thal (Rottemann, Trieben) and at and near Graz. These turn out a great variety of iron goods; small articles as well as scythes, machinery, locomotives (Graz), bicycles (Graz) and wagons. Graz makes carriages and automobiles and also holds an important place in the wide-spread wood industries (including furniture). The manufactures of lignite and cellulose, pasteboard, paper (Graz-Korn, near Graz, and other places), also of beer (Graz), tiles, flour, leather, explosives (Deutsch-Landsberg and other places) are considerable. Less important are flour-milling, and the textile, glass, tobacco and chemical industries.

**Communications.**—The new frontier cuts through the Marburg-Unterdrauburg line so that the connexion between Middle Styria and Carinthia goes a long way round, causing considerable inconvenience. Mariazell is now connected by rail with Vienna.

**SUBMARINE CABLE TELEGRAPHY** (*see* 26.527).—In 1921 there were over 298,000 nautical miles of telegraph cable in operation at the sea bottom, made up of some 3,000 separate lengths, of which about 2,540 were administered by the various governments concerned, whilst the remainder were the property of private (mainly British) companies. Of the world's cables, over 130,000 n.m. are owned by British companies, 71,000 by American companies, and 24,000 by companies of other countries. How much the Allied countries—especially Britain—were indebted to submarine telegraphy in connexion with the World War will probably never be fully realized. Had British communication with the Dominions been cut off at the outset by the enemy, months would have elapsed before arrangements could have been completed for the despatch of the overseas contingents which rushed to British aid. On the other hand, within four hours of the declaration of war, Germany was entirely deprived of direct telegraphic communication with the United States. A British cruiser effected the required interruption in the English Channel by cutting both the cables running between Emden and New York via the Azores, one being taken in to Penzance (Cornwall). Then in March 1917 they were both cut at points 643 and 610 n.m. respectively from New York, one of them being diverted by a British P.O. telegraph ship into Halifax, Nova Scotia. Since July 1917 this has been at any rate temporarily turned to account as a connecting link with the All-British Pacific Cable system. The other line was handed over to France and taken in to

Brest.<sup>1</sup> Altogether 20,000 n.m. of ex-German cables were captured during the war; covering practically every one of those passing through the English Channel.

Remarkable indeed were the achievements of submarine telegraph cable-laying and repairing authorities during the war. Despite the active German submarine warfare, a vast number stand to the credit of British ships, largely to meet immediate strategic requirements. Whilst some of these were effected by cruisers of the Royal Navy provided with the necessary apparatus and the required length of cable, they were in the most part carried out by specially designed telegraph ships, though accompanied as often as possible (where especially desirable) by a man-of-war as escort. In addition to manufacturing 20,000 m. of trench telephone cable, the Telegraph Construction and Maintenance Co. made 19,000 m. of submarine cable, and its ships were actively engaged on highly dangerous work in the way of laying, repairing and diverting cables. The "Telconia"—perhaps the most efficiently designed telegraph ship in existence—made 75 cable repairs and laid 24 new lines around the English and Irish coasts whilst in commission for H.M. Post Office.

The first entirely new cable to be laid during the war was that by the Telegraph Construction Co.'s T.S. "Colonia" between Montevideo and the Falkland Is. in 1915, under the auspices of the British Admiralty. In the same year, this company also laid, under Post Office supervision, a direct Anglo-Russian cable from Peterhead (Aberdeenshire) to Alexandrovsk (about the nearest Arctic Ocean coast point to Petrograd). In both instances this was the earliest occasion on which a cable had been brought to the farther point. The first line had purely strategic objects in view, but the second was more especially to meet the fact that communication between Britain and Russia had previously been only effected across countries that were now to a great extent enemy countries; indeed, the Indo-European Telegraph Co.'s land line system had become practically inoperative ever since the outbreak of the war. This work was a truly remarkable feat. The cable was laid in the winter and was landed on Russian territory at the time of year when the sun does not rise above the horizon in those northern latitudes. In fact, the entire undertaking had to be carried out in darkness, as well as in seas infested with enemy submarines. It was conducted with every possible secrecy, it being arranged for the "Colonia," in order to mislead the enemy, to go on a preliminary cruise in an entirely different direction. With land lines at each end and special repeaters, direct telegraphic communication was thus established between the Central Telegraph Office in London and the corresponding building in Petrograd. Moreover, many telegrams from countries S. of Russia—Greece, for instance—passed over this cable in making their circuitous journey from the Levant to various quarters of the globe. This was the first piece of ocean cable work that the British Post Office had ever had to do with. Thus, for its purpose, Post Office engineers and clerks were initiated, at short notice, in the art of deep-sea cable-laying and long distance cable-working at the hands of the contractors, as well as by a staff of the Eastern Telegraph Co. provided for working the cable.<sup>2</sup>

The other more especially important piece of British cable work was the putting through of one of the Emden-New York cables as the first Imperial Atlantic cable to link up with the All-British Pacific line. The path taken by what now constitutes a completed "All Red" route to Australasia is London, Penzance, Fayal Isle, Azores (mid-Atlantic), Halifax, Bamfield (Vancouver), Fanning I. (a small, mid-Pacific, coral formation), Suva (Fiji Is.), Norfolk I., from whence there are two branches, one to Southport, Queensland (Australia) and the other to Auckland (New Zealand).

The Atlantic section of this "All Red" cable system was being worked in 1921 by the Post Office. Thus it has come to pass that a Government department, that, conjointly with the great cable companies, had opposed in turn the scheme for an All-British

<sup>1</sup> Owing to the enemy's submarine activities, the late German Atlantic cables could not be attended to for some 14 months.

<sup>2</sup> The Post Office Engineering Department's previous experience of cable work was closely confined to short Channel lines, etc.

Pacific Cable and then later that for an All-British Atlantic Cable, has been called upon itself to put into practice the latter, and now appears as an exponent of "All Red" cables generally. The department in question did much fine work during the war. At the very outset—on the eve of Aug. 4 1914, indeed—its principal telegraph ship, the "Monarch," set forth for the N., where many emergency cables were forthwith laid. It was not long, however, before she met her glorious end, and her "shattered bones" are now lying on the bed of the English Channel—the scene of most of her work. She was one of the very first vessels to be especially designed for cable-laying and repairing.

Another telegraph ship that met her end over the war was the "Dacia," owned by the Silvertown Company. This vessel had accomplished a great deal in her time, and during July 1915-Feb. 1916 she effected cable communications between Brest (France) and Casablanca (Morocco), by cutting in at suitable positions and picking up and relaying part of the Borkum-Teneriffe cable belonging to Germany. Nearly 450 n.m. of cable were picked up and relaid on this occasion, part of it in a depth of 2,000 to 2,500 fathoms. She then proceeded to establish communication between Casablanca (Morocco) and Dakar (W. Africa), by cutting in, picking up and relaying portions of the Teneriffe-Monrovia cable belonging to Germany. Eight hundred n.m. of deep-sea cable were on this occasion recovered and relaid in an average depth of over 2,000 fathoms. We have here a "record" in cable work. It was undertaken for the French Administration, and Casablanca had not up to that time been connected to Europe by submarine cable. The cable facilitated the sending of troops to France by Morocco and Senegal when greatly needed.

Messrs. Siemens Brothers' unique and highly efficient telegraph ship "Faraday"—originally designed by the late Sir William Siemens, F.R.S.—also achieved much during the course of the war on behalf of the British Post Office, which had at one time in commission practically every telegraph ship available, including the largest (T. S. "Colonia").

Even though observing constant vigilance, a telegraph ship, when effecting a repair, being deprived of manœuvring powers by attachment to the cable, is peculiarly vulnerable to anything like a torpedo attack. It is, therefore, something to be able to say that the Post Office kept Britain and the European continent in continuous electrical communication. During the early part of the war telegraph ships went about their business alone and unattended, but with the development of intense submarine warfare naval escorts had to be provided by the Admiralty. Escorts are not, however, a safeguard against submerged mines, and so it was that the old "Monarch" met her fate, going down with her flag flying. On one occasion a telegraph ship on repairing work hove up a mine with the cable, but beyond damage to machinery and breakage of crockery, no harm was done.

Apart from the disposal of four of the world's telegraph fleet,<sup>1</sup> there were only two instances of Germany getting the best of things in the matter of cable communication. Within the first year of the war, a German man-of-war landed a party on the deserted beach of Fanning I., and this party succeeded in cutting the All-British Pacific cable there. The other case was that of the "Eastern" cable landed at Keeling-Cocos. Here again the attacking party from the "Emden" succeeded in cutting the cables,<sup>2</sup> but an alarm signal which had been got through led to the "Emden's" final doom. In this case great enterprise was shown by the "Eastern" Co.'s superintendent, and in neither instance was the interruption very serious or lengthy. Though there were only these two cases of enemy disturbance of the Allies' cables, many were rendered dumb from the wear and tear of four years, during which time it was impossible to effect repairs, for lack of suitable ships and the risk of exposing slow-moving vessels to enemy attack.

<sup>1</sup> The total number of such vessels in 1921 was 49, of which some half dozen were owned by contractors for the original laying of ocean cables, the rest being smaller vessels, of the cable working companies, for subsequent repairing operations.

<sup>2</sup> The officials in charge had, however, prepared a ruse by utilizing some spare cable as a dummy, and this dummy the Germans solemnly cut.

During the latter part of the war, the American submarine cables on the Pacific and Atlantic Ocean coasts were taken under control of the United States Government. *Inter alia* there was a feeling that considerable advantage would attach to the coordination of all the telegraph systems throughout the country. Eventually (Nov. 2 1918) the U.S. Postmaster-General also assumed administrative control of all cable landing on U.S. territory, after the necessary negotiations with other countries concerned had been carried through. Control ended on May 2 1919.

*Post-war Developments.*—War wastage, the banning of private codes, considerable general increase of traffic<sup>3</sup> (partly owing to absence of mails) and voluminous Government messages, were all responsible for an appalling cable congestion during the war, the result being several days'—sometimes even weeks'—delay in the transit of messages on most of the more important trunk lines. Though, after the Armistice things became somewhat easier, with the withdrawal of the censorship and the renewal of private codes, the ultimate delivery of cablegrams was even in 1921 a very slow business. When the Marconi Trans-Atlantic wireless service was re-established some measure of relief was felt. Unfortunately, however, it was only capable of dealing with a small proportion of the ordinary prevailing cable traffic. The hampering of trade, during the war, by the prohibition of most private cable codes, was very considerable. To take an example, a certain firm had been in the habit of sending every week some 40 cablegrams at an average of £1 each. The cost of the same messages in plain English would have been some £320.

Most of the cables requiring repairs after the war had been attended to by 1921, but there was still considerable delay on cablegrams, even though the lines were being worked at their full capacity, day and night.

When it is remembered that in the year before the war (1913) 826,000 messages passed through the two Atlantic cables then connecting the United States with Germany,<sup>4</sup> it will be realized what it meant to American commerce alone to be deprived of these direct cable connexions. In 1921 it was planned to lay a new Atlantic cable between the two countries, and to extend the German cable that had been taken into Brest by the French, as a compromise, to central or northern Europe with a landing *en route* off Denmark.

Ever since all of what were formerly British Atlantic cables passed, in 1912, into the administrative hands of the Western Union Telegraph Co. of America, the British Government had been strongly urged—as, indeed, for many years previously—to establish a State Atlantic Cable as a connecting link with the All-British Pacific Cable. The war only served to accentuate this view. Whilst the capture and diversion of the German Atlantic Cable (taken into Penzance and Halifax) went some way to meet requirements, this line had not only been irregular in its performance but much congested with traffic, largely American. When therefore, in 1919, the Western Union Co. brought to an end their lease of the Direct United States Co.'s cable system—between Ballinskelligs (Ireland), Halifax (Nova Scotia) and Halifax-Rye Beach (United States)—on the ground of it being so constantly out of operation—the British Government entered into negotiations, towards the end of 1920, for the purchase of the line at a cost of £570,000, or scarcely more than half the value of a new cable. When this is given effect the line—together with the Imperial Pacific Line—will form a complete and strictly "All Red" route between the Mother Country and Australia. Though the line (originally laid in 1874) is even of more ancient order than the ex-German cables, British Imperial needs will, to a great extent, be met. The shortcomings will be further met when a Canadian land line, connecting the All-British Atlantic and Pacific Cables, is provided.

The All-British Pacific Cable, first laid in 1902, has more than justified itself. During its first year scarcely more than 200,000

<sup>3</sup> In the case of the Eastern Co.'s system this was more than doubled by the war. Thus, the annual gross receipts of the company were about £2,000,000 more than previously, and much the same applies to others in the same group.

<sup>4</sup> In actual fact these cables accounted for 32% of the total traffic of the Commercial Cable Company.

words were sent. Ten years later, the volume of traffic had been increased ten-fold. The war brought this up to some 26,000 words per day, or about 9,500,000 words per annum. Notwithstanding the large capital cost of this line (£2,000,000) it produced a gross profit of £94,000 for the year 1920, whilst its reserve fund stood at nearly £1,107,000. To illustrate the high strategic value of the line, during the war, if the Allies had happened to be—even temporarily—deprived of naval control, the British Mediterranean cables would undoubtedly soon have been cut, which would have meant that British inter-imperial telegraphic communication could only have been secured by means of the All-British Pacific line. It had been felt for a long time that, since the Imperial Pacific cable was laid as far back as 1902, steps must be taken to duplicate it in order to provide against complete breakdown, as well as for dealing with over-congestion. In 1921, however, owing to the necessity for economy and to the high cost of materials, it seemed probable that this duplication would require to be limited, for the present, to the duplication of the long, slow working, section in very deep water, i.e. the 3,458 n.m. between Bamfield (Vancouver) and Fanning I., which runs into a depth of 3,400 fathoms (nearly 3½ n.m.), and brings down the resultant speed on the whole line to a low figure.

Perhaps nothing contributed more in the past to the leading commercial position of Britain than her enterprise in the matter of telegraph cables. Fortunately, too, she also recognized that the problem of Empire is largely a problem of communication. Arising out of the war to some extent, there has been a general demand for a great deal more inter-communication, not only between different branches of the British Empire, but also between distant foreign countries. This demand must be met in the first place by a considerable addition to the world's cable system over and above those that were in operation previous to hostilities. The part of the British Empire which in 1921 was more especially badly served in the matter of telegraphic communication was the West Indies, where, largely owing to the nature of the sea bottom, the existing inter-insular lines (originally laid in 1870) were constantly breaking down.<sup>1</sup> But for "atmospherics" in these tropical regions, this would be an ideal case for "wireless." As it is, it would seem that an efficient air service would do most to improve prevailing shortcomings—at any rate for mail purposes, the steamer service being also very deficient. From a world standpoint, however, probably the most acute need for additional cable facilities is in the Pacific Ocean, for, while the traffic over the N. Atlantic cables has been practically quadrupled since 1913, Pacific cable traffic has increased nearly nine-fold.

The war also aroused the United States to her disadvantage in the matter of cable communication as compared with her trade rivals. Thus, on April 26 1921, the U.S. Senate passed a bill "to prevent unauthorized cable landings in the United States or any of its possessions." The bill gives the President sweeping authority also to issue, withhold and revoke licences as to cable landings, as well as for obtaining concessions for the United States in other parts of the world. Section 2 of the bill enables the President "to withhold or revoke such licence when satisfied such action will assist in obtaining for the landing or operation of cables in foreign countries or in maintaining the rights or interests of the United States." The President may grant such licence on such terms as will assure just and reasonable rates. The licence is not to give the licensee exclusive rights of landing or of operation, in the United States. The policy appears to be based chiefly upon considerations that shall guard against consolidation or amalgamation with other cable lines, while insisting upon reciprocal accommodation for American corporations and companies in foreign territory. In 1920 the U.S. authorities refused to allow a cable laid for the Western Union Co. to be landed at a point on the coast of Florida on the ground that it was intended for connecting up, *via* Barbados, with the "Western Telegraph" system (at Maranham) of a British company.<sup>2</sup> The American Govern-

ment considered that allowing such a cable to be laid would have lent colour to the British company having sole rights of communication between the United States and Brazil. As a matter of fact, another American company (All America Cables, Inc., of New York)<sup>3</sup> was also preparing to lay a cable to the Brazilian Coast, and it was thought by the U.S. Government that by acceding to the application of the Western Union Co., the claims to a monopoly being possibly established thereby might prevent the other cable being laid—a cable greatly to the interests of American trade with Brazil. The United States had evidently determined to establish its own system of cables throughout the world, partly for high national reasons, but also with a view to developing trade, especially with S. America.

France also has shown a disposition to be increasingly active and enterprising in this matter; likewise Japan.

*International Cable Conference, 1920-1.*—Probably no telegraphic conference has ever been the scene of such acute disagreement on essential points as that which held sittings during parts of 1920 and 1921 at Washington. This was perhaps natural, when we remember (a) that Germany had been relieved of practically all her cables, (b) that the destiny of these cables was of first-rate importance to all the principal powers.

Soon after the confiscation of the German cables an agreement was entered into between Great Britain, France, Italy and Japan, whereby these ex-German lines were to be severally distributed amongst them. The United States having come into the war some time later, it was proposed at the Conference, that these cables should, as a substituted arrangement, become the joint property of the five Allies.

The actual diversion of the German Atlantic cables was completed by Great Britain in July 1917, and by France in Nov. 1917—in both instances after the United States had joined the Allies. The American view was, therefore, that neither of these appropriations of cables between the Azores (Portuguese possessions) and the United States could be justified, seeing that both the United States and Portugal were already allied with England and France in the vigorous prosecution of the war. Then again, no single section of the ex-German cable in the Pacific touched Japanese soil, but one landed on American territory (Guam). Thus it was argued that it was something of an anomaly that the Japanese should ever have seized the German cable system, to the great detriment of American trade with China and the Philippines—and correspondingly to their own (Japanese) advantage.

There were probably few matters that could, in principle, be dealt with so suitably by the League of Nations as those associated with international telegraphic communication. But that could only apply if, and when, the United States joined the League, or, on the other hand, in instances where America was in no way concerned. With ex-German islands and cables, however, it was quite clear that the United States was very much concerned. Further, there was no nation whose interests were liable to be so much affected by the mandate as regards Yap—more especially in reference to the cable—as the United States. The control of telegraphic communication between that island and China meant much to Japan. On the other hand, such an arrangement was regarded as contrary to American interests. In these circumstances, seeing that the United States was one of the "principal Allied and Associated Powers," the question was raised why such a mandate was ever granted to Japan without the assent of the United States. However, the Yap difficulty was eventually settled, so as to preserve American rights, at the Washington Conference in Dec. 1921 (see JAPAN; also WASHINGTON CONFERENCE).

consideration of recent years both in Britain as well as in the United States. Thus, in order to improve the then existing facilities, a cable was laid in 1910 by the Telegraph Construction & Maintenance Co. between St. Vincent, Ascension and Buenos Aires, these sections now forming a part of the Western Union Telegraph Co.'s system. In 1920, the same company laid a cable between Maranham and Barbados.

<sup>3</sup> Formerly the Central & S. American Telegraph Co., with lines down the W. coast of the American continent.

<sup>1</sup> Report of the Royal Commission on Trade between Canada and the West Indies (Cd. 5369, 1910).

<sup>2</sup> The prospects of trade with S. America are, in fact, so attractive that telegraphic communication therewith has been made a special

It was perhaps in the nature of things that those countries—such as the United States—which were in a less favourable position in the matter of cable ownership should especially desire the internationalization or neutralization of cables. Certainly, the neutralization and internationalization of cable systems might have one advantage, *i.e.* bring to an end the suspicions, right or wrong, that messages concerning another country were delayed, scrutinized, tampered with, etc. Such charges were largely due to keen commercial rivalry, and principally—if not entirely—a question of news agencies rather than cable companies. Any foundation they had was probably more or less closely limited to the war, when certainly Canada was very ill-supplied with news from Europe—or indeed, with reference to Imperial matters—whilst over-abundantly informed of trouble in Ireland.

*Strategic Cables.*—Unless the strict neutralization of cables becomes the order of the day, under the League of Nations or otherwise, the best principle would probably be that every country should—partly for strategical reasons—establish for itself many more cables on a variety of routes well clear of foreign soil. These should be worked on a low rate basis for the general encouragement of intercommunication, but especially for developing commerce and trade. They should be supplemented by wireless, which is already in use as feeders to the cable systems. There can be no question that messages passing through cables touching foreign territory are insecure. If the cable lands on an enemy's country, the message is stopped or read off, and if on neutral soil, it runs the chance of also finding its way to the enemy, if only because a country which is neutral to-day may be unfriendly to-morrow. A clear distinction must be observed between an international submarine cable and a national cable. An international cable is one which connects the territory of different independent states; a national submarine cable is one which unites the territory or the colonial possessions of a single independent state. The character of the charter or ownership of a submarine cable determines whether it should be deemed foreign or national in respect to a particular state. Apart from their great strategic value, the Chambers of Commerce of practically every important town in the United Kingdom have, on strictly business grounds, loudly urged for a system of All-British cables worked at comparatively easy rates. The same course has also been taken at various influential congresses of the Chambers of Commerce of the British Empire, partly with a view to ensuring against enemy interruptions and eavesdropping. Promoters of private enterprise are indisposed to undertake the laying of cables of a strategic, rather than commercial, order. On the other hand, the cables on the trade routes—through the Mediterranean, etc.—are especially liable to interruption, much more so than those in the open ocean.

*Cable Tariff.*—The ordinary cable rates, though showing material reduction from those of the earliest days, were in 1921 still very high from the public standpoint.<sup>1</sup> For financial reasons, they were largely based on the length of cable involved (see accompanying table), whereas it is just in the case of especially great distances that the cablegram is at an advantage against the mail boat. Here is a striking case where public (*i.e.* national) and private interests necessarily clash, and where, of course, national interests should be made supreme. This, it is to be feared, can be done only by adequate state control.

In the final report (Cd. 4862) of the Dominions Royal Commission in 1917 expression was given to the view that "charges are very high, the scales extremely complicated and their justification difficult to recognize." The report goes on to say: "The popularization of the cable service can only come with a simplification of the charges and their radical reduction; at present outside its commercial use cable communication is a luxury."

In 1912 a system of half rates for plain-language cablegrams deferred in transmission for 24 hours was introduced after many years' outside pressure. This reform marks something of an epoch in the history of cable telegraphy, and has, in due course, become universal. Week-end cablegrams at a reduced rate were

also introduced a little later, this being further supplemented by reduced rates for press messages between Britain and her Dominions. There is also now the "cable letter" service which offers even more favourable rates.

With practically all the great cable companies, the tariffs were maintained throughout the war at the same normal figure, whilst considerably more business was done than under peace conditions. A great increase in Government messages occurred, and the suspension of private codes added vastly to the length of most business telegrams, not to mention the continuous flow of extensive press "cables" relating to the war. Then, again, an enormous number of messages were sent such as in normal times—free from postal shortcomings—would be limited to ordinary written correspondence or to "deferred" traffic, which was abandoned by most of the cable companies throughout hostilities. The net result was that these organizations, unlike railway companies, not only maintained their reserves, but very materially added to them during the war. The best explanation here is to be found in the fact that cable repairs to be faced after the long period of warfare were altogether abnormal, though it must be remembered most of the companies concerned already had enormous reserves. The principal exception is the case of the Central and South American Telegraph Co., combined with the Mexican

<sup>1</sup> Some of the more recent reductions may possibly be due in part to the competition—such as it is—of wireless telegraphy.

Telegraph Co. (the former operating what are now known as the All-America Cables), which, during the war, made large reductions in their tariff, even though, on the greater part of their route, holding a monopoly. The directors expressed their conviction that (a) the cable performs a very special mission during warfare, and (b) it plays a highly important part in the fostering of trade relations. They were, therefore, determined to aid in every way possible the efforts to maintain and extend the already large trade between the United States and the countries of Central and S. America.

It must not be forgotten that an essential accompaniment to a low telegraph tariff is many more communicating strings; otherwise, the congested condition only becomes worse congested. On the other hand, it is also only by great developments—of one sort and another—in our means of communication that an increased, as well as cheaper, telegraphic output can be secured.

*Nationalization.*—One result of the Dominions Royal Commission's exhaustive inquiry was the following expression of opinion.<sup>1</sup> "We feel bound, however, to record our opinion that at no distant date the nationalization of the private cable companies will become one of the most urgent problems for statesmanship." Their report states further:—"It appears difficult, if not impossible, to attain the desired cheapness of cable communication, as to the importance of which we hold the strongest views, without interfering with the rights of private companies." Again:—"The urgency of placing cable communication on such a footing that it would be available, not only to the rich, but to all classes, not only to the merchant, but also to the private individual, is manifest and imperative."

But it must not be forgotten that the world is indebted, in the first instance, to the enterprise of private companies for the establishment of submarine cable communication. Some of the companies have certainly been assisted in their enterprise by large Government subsidies.<sup>2</sup> Moreover, these companies have met with rich returns over their enterprise.

*Telegraph Control Board.*—Whether State ownership should ever be adopted by a country is, of course, a large question, but it seems obvious that in national and imperial interests a measure of State control is desirable in the matter of inter-imperial communications generally. A controlling organization of one sort or another appears to be called for, if only for watching and securing public interests, where clashing with private interests, in return for favours granted by the State.

In the case of Great Britain there are no less than seven Government departments (in addition to the Treasury) concerned in this matter. Hitherto one of these alone (the Post Office) has been acting for the Government, and all questions regarding other departmental interests had to be submitted to the Post Office. This was never very satisfactory in the result.

A British inter-departmental board to deal with inter-departmental telegraphs of all sorts has been advocated for many years. By this scheme, all the Government departments concerned were to be represented and to meet periodically to discuss and settle all important matters as they arose. The war made it clear to the British Government that something of the sort was necessary; and Jan. 1 1919 saw the establishment of such a committee, the whole coming under the *aegis* of the Committee of Imperial De-

fence. Such a control board, or committee, becomes increasingly desirable in these days of wireless development, for a nice sense of impartiality and discrimination may be required for deciding what should be effected by cable and what by wireless.

*Working Developments.*—The development of the art of submarine telegraphy was considerable during 1907-21—not so much in relation to the cable itself as to the electrical apparatus for working it. These include the introduction of automatic relays (associated more especially with the names of the late Dr. Alexander Muirhead, F.R.S., and Mr. S. G. Brown, F.R.S.) on the Eastern, Western Union, All-British and Commercial-Pacific cables, as well as other wide-spread cable systems.

These have almost entirely superseded manual retransmission between cable sections. Secondly, the introduction of magnifiers (or amplifiers, as they are sometimes called), by rendering the signals more legible, has enabled the carrying capacity of the cables to be enormously increased, at the same time adding to their reliability in the matter of accuracy. Such devices are based on the published experiments of Charles Curtis in the United States and Edward Raymond-Barker in England, and emanate in turn from K. C. Cox, T. B. Dixon, Walter Judd, Angus Fraser, E. S. Heurtley and Axel Orling. The Heurtley magnifier has been very widely adopted by the Pacific Cable Board, the Eastern Association Companies, etc. In vastly improving the character of the signals, this type of apparatus achieves the net result of adding to the effective working speed in the same degree. Indeed, the later results with the Orling magnifier point to a speed increase of as much as 200 per cent.

Thirdly, automatic printing apparatus has been introduced on the land lines worked in conjunction with cables. This apparatus is for the most part due to Mr. F. G. Creed.

Then again, Maj.-Gen. G. O. Squier, Chief Signal Officer of the U.S. army, has experimented with alternating current generators for cable telegraphy, and his researches point to results of a highly advanced—as well as revolutionizing—character.

The Imperial Cable section of the "All Red" route is associated with some of the latest developments in cable telegraphy. The transmission both at London and Halifax is effected by what are known as converter cable transmitters. These are entirely automatic in their working, and, by the use of a switch, will take either Morse or cable type of perforation. There are automatic repeaters at each of the intermediate stations. One of these sections, *i.e.* Bamfield-Fanning, 3,458 n.m., is the longest existing cable length, and has always been a source of great difficulty in the matter of speed as well as from a commercial point of view generally. In the circumstances, the results that have been achieved, by means of recent electrical devices, are very remarkable. It is, indeed, highly creditable that the score of a cricket match can be got through from Melbourne to London within 15 minutes, despite the six intermediate retransmitting points, over so great a total length. A few years earlier, such retransmissions were always effected manually. Now, however, automatic (machine) repeaters are gradually becoming general for all extensive systems with a number of intervening cable sections. The average duplex working speed on the entire route (controlled by that of the long section) was formerly 18 words per minute,<sup>3</sup> but it has been very considerably increased by means of the Heurtley amplifier or magnifier. Something like a 40% increase in the simplex working speed (or 20% duplex) is claimed on this apparatus, which converts the microscopic signals associated with a long cable worked at high speed into characters of reasonable size. On the Atlantic sections some of the very latest devices have been introduced for the purposes of efficient and high speed working, such as had previously been adopted by the Eastern Associated Telegraph Companies. In the main, the plan is that of Morse working in connexion with the Gulstad Relay, so that the speed of connecting land lines is brought up to that of cable code working.<sup>4</sup> The Eastern Compa-

<sup>1</sup> Final Report (Cd. 8462 of 1917).

<sup>2</sup> These are as follows:—

Name of Company	Amount of Subsidy	Period of Subsidy	Cables for which Subsidy granted
Eastern Telegraph Co.	£ 4,500	20 years from April 24 1901.	Sierra Leone-Ascension.
Eastern & S. African Telegraph Co.	{ 28,000 13,500	20 years from Nov. 1893. 20 years from Jan. 1 1900.	Zanzibar-Seychelles-Mauritius. Three S. African cables.
Eastern Extension Co.	4,000	Indefinite.	Chefoo-Wei-haiwei.
Direct West India Co.	8,000	20 years from Feb. 1 1898.	Bermuda-Jamaica.

<sup>3</sup> Nearly all long cables are now worked on the duplex system.

<sup>4</sup> On the Indian Government (Persian Gulf) system between Basra and Karachi, the speed for land line Morse was actually raised from 35 to 75 words per minute.

nies have further greatly added to the efficiency of their system by means of the Creed Printer, which is also installed on the Atlantic section of the "All Red" route, as well as in connexion with Wheatstone high-speed working on the Pacific cable land line system between Melbourne and Sydney.

A Stock Exchange Telegraph Service of a highly efficient order was established some years ago between London and New York. So efficient is this that messages are got through within ten minutes. Something like 2,500 such messages are transmitted between the two Stock Exchanges during an afternoon.

**Cables and Commerce.**—In pre-cable days each country was, in large measure, an independent commercial unit. The submarine cable has done much to alter that state of things. Whereas in 1870 the total value of the commerce between the United States and Great Britain was about £90,000,000, in the fiscal year ending June 30 1920 it was as much as £525,000,000. Besides the enormous increase in volume of business brought about by the extension of telegraphic service across the oceans, this quickened communication has also brought a complete change in business methods. It has, indeed, introduced an element of stability into international trade such as was seriously lacking when intercourse depended solely on the mail.

The World War has tended also to increase cable traffic because of changed business habits. During the early months of the conflict a rigorous censorship on cable messages was enforced by the Allied Governments. At first codes of all kinds were prohibited, and although this regulation was subsequently modified to allow the use of ordinary commercial codes, private codes and lighter messages were stopped. As a result, many business firms discovered that for much of their cable business the time and labour spent in coding and decoding—as well as the errors which are inevitable in the transmission of unintelligible matter—made messages in plain language only slightly more expensive than code. The result after the war has been a considerable increase in the percentage of plain-language messages. Another factor in the greater traffic has been the increased use of the cables for transactions which were formerly carried on by mail. This has been due partly to changed conditions which have made speedy communication more than ever necessary, and partly to the fact that the business houses, which were forced to increase their use of the cables during the war, have continued to do so on discovering the great convenience of cable communication in comparison with the mail.

**SUBMARINE CAMPAIGNS.**—At the beginning of the World War the submarine was a comparatively new weapon of untried possibilities, whose ultimate place in naval warfare it was hard to foresee; and there ensued a period of tentative effort, confined at first to the North Sea, which lasted from Aug. 1914 to Feb. 1915. Germany started the war with 28 submarines, but the unreliable nature of the Korting engines fitted in the first 18 boats (U1-U18) had given her a low opinion of their merits. This was accentuated by the result of the first operation of the war consisting of a sortie by 10 boats up the North Sea, in which U15 was rammed by the light cruiser "Birmingham" on Aug. 9 1914 and U3 disappeared. On the British side some 56 submarines were available, the newest boats of the D and E class being attached to the 8th Flotilla (18 boats) employed under Commodore Roger Keyes in guarding the approach to Dover Straits with a couple (E6 and E8) reconnoitring in the Bight.

**Early Days of the War.**—Submarines did not play a decisive part in the Heligoland Bight action on Aug. 28. The six British submarines present were discovered by the unexpected appearance of British light cruisers, and the German submarines were retained off Heligoland guarding the approach to the rivers. The first British warship to be sunk by submarines was the "Pathfinder," a small cruiser torpedoed by U21 (Otto Herring), off the Forth on Sept. 5, an incident which aroused little comment beyond emphasizing the danger of old ships patrolling on

regular beats. The sinking of the "Cressy," "Hogue" and "Aboukir" off the Dutch coast on Sept. 22 1914 was a much heavier blow. They had been sent to patrol on the Broad Fourteens, between England and Holland, and were steaming slowly in line abreast two miles apart at 6:30 A.M. when the "Aboukir," "Hogue" and "Cressy" were torpedoed in quick succession. This was the work of Otto Weddigen in U9, and the wholesale disappearance of Cruiser Force C within an hour with a loss of over 1,400 men came as an unpleasant shock, and definitely established the power of the new weapon. By the end of Sept. submarines were pushing past Dover Straits into the Channel, and on Oct. 16 1914 the fear of the new weapon reached a climax, when on a false alarm of one in Scapa Flow the British Grand fleet hastily put to sea at night and proceeded to Lough Swilly where by a freak of misfortune the "Audacious" ran on a mine and was lost. Oct. 20 1914 had seen the sinking of the first merchant ship, the ss. "Glitra," off Norway by U17, but it was not until Nov. 23 that U18 actually attempted to enter the Flow. The Grand fleet were at sea at the time and U18 was rammed by a minesweeper, the "Dorothy Gray," close to the Hoxa entrance. She went down to 11 fathoms with her hydroplanes damaged, and coming to the surface later was rammed by the destroyer "Garry" and forced to surrender, the first and (with the exception of UB116 in 1918) the last attempt to enter Scapa Flow.

**Defensive Methods.**—The war found the British navy almost destitute of defensive methods against the submarine. A committee had sat on the subject but had evolved nothing but the modified sweep—a somewhat clumsy contrivance consisting of a line of explosive charges towed astern, regulated in depth by a water-kite and fired from inboard. The defence of Scapa had been mooted as early as 1912, and Adml. Jellicoe, then at the Admiralty, had taken an important part in discussions on the subject, but nothing had been done beyond allocating a small sum for the purpose in 1913, which was diverted to Dover to build a wall on the breakwater, in pursuance of the pre-war tendency to try and fit prospective wars into the existing naval ports. By the end of 1914 Cromarty had been supplied with Capt. Donald Monro's boom, but Scapa with all its entrances was not secure till Feb. 1915. Counter measures at this stage of the war were confined to an extensive development of the Auxiliary Patrol organization, the tentative supply of defensive armament to merchant shipping, and the equipment of a comparatively small number of vessels with the modified sweep. The trawlers of the Auxiliary Patrol played an important part in minesweeping and in escort work, but were too slow and too poorly armed to be really effective in offensive operations against the submarine. By the end of 1914 the submarine was generally recognized as a new and powerful weapon in naval warfare, though its tremendous potency as an instrument of the *guerre de course* had not been fully realized. Germany had lost 7 and with the addition of 11 had 30 now available, with 42 U boats and 127 UB and UC under construction and on order. Von Tirpitz, fully alive to their possibilities, was already building great hopes on them.

The early morning of New Year's Day 1915 saw the old battleship "Formidable" (Capt. A. N. Loxley) fall a victim to U24 off Start Point while patrolling up and down with the Channel fleet at 10 knots. The captain went down with the ship. Only 141 were saved out of a crew of over 800, and the incident demolished once and for all the opinion of a certain school of naval thought that the submarine could be ignored.

They were now going farther afield. Otto Herring in U21 made his first cruise to the Irish Sea in Jan. 1915, and this month too saw the first instances of a ship being torpedoed without warning in the case of the British s.s. "Tokemaru" and s.s. "Ikaria" off Havre on Jan. 30 by U20 (Schwieger, who was to earn an unenviable reputation for ruthless warfare).

**Campaigns of 1915.**—Feb. 4 1915 saw the close of what may be termed the preliminary phase of submarine warfare. The German naval staff now decided to conduct a general campaign against merchant shipping, and on this date the German Government issued a declaration constituting all waters round Great Britain and Ireland a war zone (*Kriegsgebiet*), in which from

Feb. 4 all enemy merchant ships would be destroyed without it being always possible to avoid danger to passengers or crew, and where even neutral vessels would be exposed to danger of attack. This evoked on Feb. 11 a strong protest from the United States denouncing it as an indefensible violation of neutral rights. The date was postponed to Feb. 18 and the order modified to the extent that neutral ships were to be spared, though in adjudging their neutrality all circumstances and not the flag only were to be taken into account. March 18 1915 saw the end of Otto Weddigen in U29 which was on her way home round Great Britain, about half-way between Kinnaird Head and Norway, when she was rammed by the battleship "Dreadnought" after attacking the battleship "Marlborough." The inauguration of the new campaign was followed in March by the establishment of the Flanders flotilla, which at first consisted of small UB and UC boats working chiefly round the Thames and east coast. By Oct. 1915 it had grown to 16 boats, and was contributing a fair proportion of the ships sunk.

The Flanders flotilla had hardly started its career when it met with a formidable obstacle in Dover Straits. Experiments had been proceeding for some months in the use of steel wire nets to indicate and obstruct the passage of submarines, and the admiral at Dover (Rear-Adml. Hon. Horace Hood) now succeeded in closing the Straits by this means for over four months. The nets used were in lengths of 100 yds. and 60 or 30 ft. deep, shot by drifters, and by Feb. 13 1915 he had some 30 drifters riding to their nets in the Straits. Bad weather took a heavy toll of the equipment, but the results were surprisingly successful to an extent hardly appreciated at the time. U8 fouled one of these nets on March 8 1915 off the Varne and was forced to come up by the destroyer "Ghurka," which exploded a modified sweep over her. U37 went down the Channel later in the month and never returned. Early in April U32 got caught in a net, and had so much difficulty in getting clear that she went home north-about. She drew a formidable picture of the obstruction, and on the strength of her report the Bight flotillas received instructions to go northabout, and the Flanders boats following their example also eschewed the Straits for over four months. It was thought at first that in the net a permanent antidote to the submarine had been found, and net bases were established at several ports, particularly at Larne for the North Channel, but technical difficulties (clips and indicator buoys) supervened, and the Germans overcame the lighter form of net by net cutters.

The sinking of the liners "Falaba," "Lusitania" and "Arabic" constituted three beacons in the 1915 campaign. The former, an Elder Dempster liner of 4,806 tons on the way to Sierra Leone, was torpedoed with five minutes' warning on March 27 by U28 off the south of Ireland, and sank in eight minutes with the loss of over 100 lives. The indignation arising from this incident had hardly subsided when it was fanned to fever heat by one of the most momentous incidents of the war. On May 7 1915 Schwieger in U20 was off the Old Head of Kinsale (south of Ireland) when he sighted a great liner homeward bound. This was the "Lusitania" going only 18 knots, her decks crowded with women and children. At 2:15 P.M. he sent two torpedoes into her without warning and she went down in 20 minutes with the loss of 1,198 lives, while Schwieger "moved with mixed feelings" watched the terrific scene. A chorus of applause arose in Germany, but the deed can be seen now as an error of the first magnitude, which set on foot the whole train of circumstances which brought America into the war. The controversy between the German naval staff and the Chancellor immediately reached a crisis. The latter refused to be responsible for such acts, and on June 5 1915 an imperial order was issued forbidding the sinking of large passenger vessels. Von Tirpitz, the Secretary of State, was furious, and he and Bachmann, the chief of the naval staff, both sent in their resignations, but were commanded bluntly to remain at their posts.

Meanwhile Otto Hersing, the pioneer in distant fields, had sailed on April 25 in U21 for the Mediterranean. Arrangements had been made to provide him with oil on the way, probably in the vicinity of Tangiers, but they broke down, and he arrived

at Cattaro on May 13 with only half a ton of oil fuel left. He reached the Dardanelles on May 25 and instantly made his presence felt. The "Vengeance" was missed by a torpedo that day; the old battleship "Triumph" supporting the Anzacs off Gaba Tepe was hit by two torpedoes at 12:30 P.M. and turned turtle in nine minutes with a loss of over 200 lives. Two days later (May 27) the "Majestic," supporting the troops inside the Straits, was hit and capsized with the loss of 49 men. The whole system of naval bombardment received a severe shock, though it was not till Aug. 13, when the "Royal Edward" was sunk near Kos by UB14, that the transports began to suffer.

By this time another counter to the submarine had been found in the decoy ship, whose early type consisted of trawlers or vessels with submarines in tow. Three submarines were sunk in this way during the summer of 1915 (U40 on June 23 by C24, U23 on July 20 by C27, and U36 on July 24 by the "Prince Charles"). Aug. 19 1915 saw the destruction in the approach to St. George's Channel by the decoy ship "Baralong" of U27, while she was attacking the "Nicosian." Several German sailors had boarded the latter vessel, and the American cattlemen in her, when they saw the submarine disappear, fell on them and threw them overboard. Germany gave vent to a roar of indignation, undisturbed by the fact that the very day U27 was sunk U24 (Schneider) met the White Star liner "Arabic" outward bound off the south of Ireland and sank her without warning with the loss of 44 lives. Indignation in America flamed up anew. Again at great headquarters von Tirpitz wrestled with the Chancellor and again the Chancellor won the day. The use of decoy ships and defensively armed merchantmen, by increasing the danger of coming to the surface, provided the German naval staff with a strong argument for unrestricted warfare, but the imperial decision went in favour of the Chancellor, and orders were issued on Aug. 30 that no liners were to be sunk without warning and due regard for the safety of passengers. This was a bitter blow to the partisans of submarine warfare, and Adml. Bachmann, the chief of the naval staff, who had not been consulted on the issue, resigned and was succeeded by Adml. von Holtzendorff. The commander-in-chief of the High Sea fleet, Adml. von Pohl, also asked to be relieved, but to no purpose. He was told he did not understand the political situation. On Sept. 20 1915 further orders were issued to suspend submarine warfare on the west coast and in the Channel. The campaign now languished in British waters. From Sept. 1915 to Feb. 1916 activity against merchant shipping practically ceased in the Bight and was transferred to the Mediterranean.

During the year Feb. 1915 to Jan. 1916 a total of 304 Allied and neutral ships had been sunk by submarines with a gross tonnage of 1,059,141 tons; of these 225 (760,440 tons) were British, 54 of which had been sunk in the Mediterranean. Some 60 merchant ships had been sunk without warning during the year and 17 submarines had been destroyed, an average of one submarine for 23.1 ships.

*The Baltic.*—Meanwhile British submarines had been active in the Baltic and the Dardanelles, where a great field had opened to British heroism. In the Baltic Eg (Comdr. Max Horton) and E1 (Comdr. N. F. Laurence) were the first to penetrate early in 1915, and proved a valuable addition to the Russian (Adml. Essen's) force. On July 2 1915, when the Russians sank the minelayer "Albatross," Eg sent two torpedoes into the old cruiser "Prinz Adalbert" and drove her back to port. On Aug. 4 1915 E13 ran ashore on the Danish island of Saltholm while passing the Sound. Before the 24 hours given her by the Danes to get off had elapsed two German destroyers appeared and, opening fire on her, killed half the crew, an act which did not pass unavenged. The Germans at the time were making a determined attempt to force the Gulf of Riga with a view to operating on the Russian flank, and the battle-cruisers of the 1st Scouting Group with the 1st Battle Squadron and a number of light cruisers had been lent for this purpose by the High Sea fleet. E1 now appeared on the scene, and the very day that E13 received its deadly hail of fire sent a torpedo into the battle-cruiser "Moltke" off the Gulf of Riga, driving her back to port.

Winter did not stop the activity of the British submarines. In the latter part of 1915 E8, E9 and E19 (Comdr. F. A. N. Cromie) attacked the important iron ore trade from Lulua (Sweden) to Germany, and between Oct. 11 and 23 sank 14 large German steamers engaged in it. The "Prinz Adalbert" too was sunk by E8 on Nov. 8, and on Dec. 12 the light cruiser "Bremen" and destroyer V191 were sent to the bottom. The Germans now set to work vigorously to devise counter measures. Minefields were laid in the Sound off Drogden, in the Flint-Rinne at the southern end of the passage on the Swedish side and at Falsterbo; an old battleship was stationed to defend them; torpedo flotillas were despatched to patrol the entrance to the Baltic, and convoy flotillas were organized for the Swedish trade with the result that British submarine activity suffered a severe check and the difficulty of entering the Baltic was greatly increased. The work of submarines there was also seriously hampered by the inability of the Russian dockyards to cope with their demands, an unmistakable indication of the probable failure of any attempt to conduct a big campaign in that sea.

*The Mediterranean.*—In the Mediterranean the ability of submarines to assist the Dardanelles campaign by interfering with Turkish transport in the Sea of Marmora was fully realized, but the passage of the Dardanelles was not an easy proposition. Twenty-seven miles long with a width of only a mile in the famous Narrows (the  $\frac{3}{4}$  m. stretch between Chanak and Nagara) lent itself easily to defence, and could be transformed into a veritable trap for submarines. It is impossible to give the details of every passage where every passage was an heroic venture. Lt.-Comdr. Norman Holbrook had made the passage on Dec. 11 1914 in B11 and torpedoed an old battleship, the "Messidieh." E15 (Lt.-Comdr. T. S. Brodie) was now the first to go up on April 15, but grounded in Kefez Bay (on the Asiatic side some 10 m. up) and was lost, his ship being torpedoed later by a picket boat under Lt.-Comdr. Eric Robinson, to prevent it falling into the hands of the Turks. E14 (Lt.-Comdr. E. C. Boyle) followed, passing Chanak on the surface and running submerged for forty-four hours. She sank three ships, including the transport "Gul Gemel" with 6,000 troops, bringing her commander a V.C. AE2 (Lt.-Comdr. H. H. G. Stoker) made the passage on April 25, diving under the minefields, but on the 30th broke surface suddenly, and coming under fire was forced to the surface and sunk. On May 1 the French submarine "Joule" attempted the passage and succumbed to a mine. E11 (Lt.-Comdr. M. E. Nasmith) passed safely at the end of May, sank no ships, penetrated into the Bosphorus and torpedoed the transport "Stamboul" and an ammunition ship there. Passing Kilid Bahr on his way back, her commander found a large mine perched in the bows which he dropped neatly by dipping and going astern, and won a V.C. in its place. E2 (Lt.-Comdr. Kenneth M. Bruce), E7 (Lt.-Comdr. A. D. Cochrane), E2 (Comdr. David Stocks), E20 (Lt.-Comdr. C. H. Warren) and H1 (Lt. Wilfred Pirie) followed, doing the same heroic work in difficult and dangerous waters. E14 was up again in July and sank 22 ships, great and small, including a 5,000-ton steamer on Aug. 7, and clearing the Sea of Marmora. He was assisted in this task by E11, who sank the old battleship "Hairredin Barbarossa" the same day and the transports "Chios" and "Samsoun" with the ammunition ships "Espahan" and "Tenedos" a week or so later. By this time a powerful barrage had been laid at Nagara, greatly increasing the risk of the passage. The French submarine "Mariotte" encountered an enemy submarine and was sunk (July 26) and E2 on her way in got badly entangled in the Nagara obstruction, but managed after 10 minutes' plunging about to get clear. E7 was not so fortunate. Going up on Aug. 4 she got enmeshed in the nets, and after the explosion of three mines in her vicinity was forced to the surface and sunk. E12, who followed in Sept., remained up 40 days with E20 and H1 in her company for a time and sank 37 ships. On the way down she fouled a net in the Narrows and went down to 245 ft., with the hydroplanes jammed and the conning tower flooded; finally she struck the chain moorings at Kilid Bahr which swept away the entanglement, and though she broke surface and came under fire managed

to win through. The French submarine "Turquoise" was sunk by gunfire on Oct. 30 1915, and a final lot of British boats was taken in E20 (Lt.-Comdr. C. H. Warren) which fell a victim to stratagem after passing through the Narrows. With the help of an Allied code probably taken from a captured submarine she was inveigled to a rendezvous and torpedoed by UB14 on Nov. 6. E11 remained up a record period of 48 days in Nov. and Dec., sinking 46 ships of different sizes. The last submarine to make the hazardous passage was E2, which was recalled on Jan. 2, a week before the final evacuation, and got safely through.

For the latter part of the year 1915 two submarines had usually been working in the Sea of Marmora at a time. Altogether some 32 passages had been made or attempted by submarines, and though they had incurred the loss of 7 of their number (E15, AE2, E7, E20, "Joule," "Mariotte" and "Turquoise,") their efforts had met with a large degree of success. The Sea of Marmora had been made unsafe, the Turks had been forced to send their troops by a roundabout route—by rail to Rodosti and then a three days' march to Gallipoli. Their tale of losses included two old battleships, one destroyer, 12 sloops and small craft, 7 transports, and no less than 197 vessels of all sorts and sizes, steam and sail, of which 36 were over 1,000 tons. This was the end of the Dardanelles submarine campaign, whose record fills a golden page in the annals of the navy.

In the autumn of 1915, when activity in British waters diminished, five more German submarines were sent to the Mediterranean. With them went Max Valentiner in U38 and Arnaud de la Periere in U35, two of the most distinguished German submarine commanders. The result was immediately evident. Valentiner, on his way from Gibraltar to Cattaro alone sank a round dozen of ships, including the Italian liner "Ancona" with a loss of over 200 lives, and the sinkings in the Mediterranean in Nov. went up to 23 chiefly off Crete, Malta and Tunis. They were nearly all merchant ships. No more men of war fell to them, and out of 242 transports only three were lost, the "Royal Edward" (Aug. 13, loss of life 955), "Ramazan" (Sept. 19) and the "Marquette" on Oct. 23. On Dec. 30 1915 Valentiner sank the P. & O. liner "Persia" (7,974 tons) off Crete without warning with a loss of 334 lives, but Germany refused to admit that it was one of her submarines and tried to transfer the responsibility to Austria. This brought the year 1915 to an end, a year fertile in hope and speculation, begetting vast promises of further success. To all Germany the future of her navy lay beneath the waters, though few could read the riddle as far as the bottom of Scapa Flow.

*Types of German Submarines.*—A short digression may be inserted here on the general types and characteristics of German submarines. They comprised four main classes—converted merchantmen (Deutschland class), U boats, UB and UC. The converted mercantile numbered a bare half-dozen (U151-U155) and were used chiefly off the Azores and in 1918 off the coast of America. They were about 213 ft. long, large, slow and clumsy, going about nine knots only on the surface, but capable of remaining out for three to five months. They had a good armament of two 5.9-in. guns, six torpedo tubes (4 bow, 2 beam) and 30 torpedoes. The U boats were the principal type, and were large boats which did most of their work in the Atlantic approaches. They were 210-225 ft. long, could go 14½-17 knots on the surface, and 8-9 knots submerged. They could only maintain this speed submerged for an hour or so, but could continue at a speed of about two knots for as much as 48 hours; then, like all submarines, they had to come to the surface and recharge their batteries with the help of their Diesel motors. They carried two guns (usually one 4.1 in. and one 22-pounder), with 4 to 6 torpedo tubes and 8 to 12 torpedoes, and remained out generally from 25-30 days. There was also a special class of U minelayers, which originally numbered 10, viz. U71-U80, carrying 36 mines and 2 torpedoes. They had only a single hull and were slow boats, rarely cruising at more than 5 knots. Though the work on the west coast of Scotland and off the Dutch coast in 1918 was done by these boats they were not as a class very successful, and by 1918 there were only 5 of them left. The UB boats were originally built for coastal work, and the first 17 were small boats capable of being sent in sections overland. The earlier boats could remain out from 7-14 days, the later boats from 14-24 days. They carried one gun forward (a 4.1 in. or 22-pounder) and the earlier boats 2 to 6 torpedoes, which were increased to 5 tubes (4 bow, 1 stern) and 10 torpedoes in the later type. The UC boats were essentially minelayers, carrying one 22-pounder forward, 3 tubes with 4 to 6 torpedoes, and 18 mines. They remained out

from 10-20 days in the North Sea, but when working in the Channel from Flanders rarely more than twelve. Submarines cruised normally on the surface. When attacking they usually proceeded at periscope depth (about 45 ft. for U boats), cruising at 65-85 ft., and going to 150 ft. if attacked. The fact that a periscope was rarely visible, even with glasses, at over a mile, emphasizes the difficulty of counter-attack.

**German Submarine Flotillas.**—The flotillas were distributed in four principal commands—the North Sea (or High Sea fleet) flotillas working from the Bight and usually termed the North Sea flotillas; the Flanders flotillas working from Zeebrugge; the Mediterranean based on Pola, Cattaro and Constantinople, and the Baltic (or Kurland) flotilla working from Baltic ports. The Flanders flotilla consisted wholly of UB and UC boats and was allotted a definite area of operations, which extended on the east coast of Great Britain as far as Flamborough Head (Yorks), and in the Channel as far as 7° W. (about as far as Waterford) and down to the Gironde. At the beginning of the year 1916 the strength of the various flotillas was approximately North Sea 16, Baltic 6, Flanders 18, Mediterranean 12. There were 16 boats approaching completion, and 161 boats building and being delivered at the rate of 8 to 10 a month.

**Campaign of 1916.**—The year 1916 was marked by another long-drawn-out controversy between the German Chancellor and the naval staff. The Chancellor stood out against unrestricted naval warfare (that is sinking at sight); the naval staff fought for it. Nor were their arguments lacking in force. If a submarine came to the surface at a distance a ship could run away, if it rose close at hand it was exposed to fire from an armed merchantman or decoy ship. In Jan. 1916 the German naval staff presented a memorandum claiming that unrestricted warfare would force England to make peace in six months. It stated that from Feb. to Oct. 1915 one or two steamers, averaging 4,085 tons, had been sunk daily by each submarine. This was an exaggerated estimate, for the figures for British ships in 1915 were more nearly one-third of a ship per submarine per day, but on this basis they calculated a loss of 631,000 tons a month, at which rate it was estimated that England would be reduced to her knees in six months. A definitive audience took place at Great Headquarters on March 6 1916, when it was decided to postpone its execution till April 1 in order to bring all possible means of persuasion to bear on the United States in the attempt to reconcile them to the idea.

Von Tirpitz, in despair at the continual frustration of his plans, resigned, and his place was taken by Adml. von Capelle. Five days before the prescribed date UB18 (Steinbrinck) torpedoed the "Sussex" on March 24 1916 on her way from Folkestone to Dieppe with 25 American citizens on board; and though she remained afloat, the forepart of the vessel was blown up and some 80 passengers were killed and injured. America's patience now came to an end, and on April 18 President Wilson threatened to break off diplomatic relations. The German Government gave way, and abandoning the idea of ruthless warfare issued an order on April 25 precluding submarines from sinking any merchant ship at sight, and requiring them in their war against trade to act in strict accordance with the methods prescribed by prize law, which entailed stopping a ship, examining her papers and giving all the crew and passengers an opportunity to leave her before proceeding to any act of destruction.

Meanwhile the chief of the naval staff at Berlin had issued an order, which came into force on Feb. 29 1916, that armed merchantmen were to be regarded as warships, and the attention of German submarine commanders was called to a clause in the prize regulations under which all merchantmen which might attack a German or neutral ship were to be regarded as pirates. This found its sequel on March 28, when Capt. Fryatt in his ship the "Brussels" attacked U33 on her way to Holland, and, being captured with his ship by a German destroyer on June 23, was tried and shot (July 27 1916).

The decision against unrestricted warfare came as a bitter disappointment to Adml. Scheer, who received the order on his way to carry out the Lowestoft raid on April 25 1916. He immediately recalled all the High Sea fleet submarines and ordered them to cease operations against merchant shipping. He refused to have anything to do with what he called the blunt edge of the weapon, and had decided that if they were not to be used in unrestricted warfare he would use them only in fleet operations.

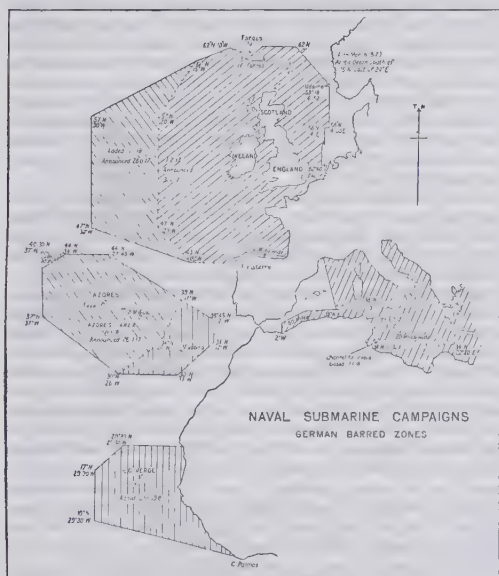

The Flanders command followed suit with most of its boats, and the Mediterranean flotillas were left to continue the campaign against commerce alone. Just as Adml. Scheer's order went out an extensive barrage was being laid off the Belgian coast (April 24) by the Dover Patrol (Vice-Adml. Sir Reginald Bacon). This was an effort on a large scale to cope with the submarine by a combination of mines and mine-nets. It consisted of some 18 m. of moored nets fitted with net mines, supported by lines of mines, running parallel to and about 12 m. off the Belgian coast. It was completed by May 7 1916 and a patrol was maintained on it by day from May to October. It is difficult to estimate its precise value, for the diminished activity ascribed to it at Dover was undoubtedly due to the cessation of submarine operations on political grounds from May to Sept. 1916. No doubt it made work more difficult for Flanders submarines, but the mines were poor and notoriously ineffective. A single boat (UB3) was destroyed in its vicinity the day it was laid by a lance bomb thrown from a drifter, the "Gleaner of the Sea." Another (UB10) ran into it and took eight hours to clear with net mines exploding all round her, and though the work entailed in the barrage deserves a generous meed of praise no submarine was actually destroyed by it in 1916, and it certainly never prevented the entry and exit of the Flanders boats.

Steinbrinck, of the Flanders flotilla, was now sent to cruise in the Channel to report on the feasibility of warfare on the lines of prize law, which involved the stoppage and due warning of ships before destruction. His report was unfavourable, and during the summer the Flanders boats worked only on the E. coast. Scheer meanwhile used his Bight flotillas (reinforced with Flanders boats) in fleet operations, of which the most important were those of Jutland and Aug. 19, when the "Nottingham" and "Falmouth" were sunk by U52 and U66. It was on this latter occasion that E23 (Lt.-Comdr. Robert Turner) torpedoed the German battleship "Westfalen" on its way out of the Bight. This was at 5:30 A.M., and on rising to the surface later at 10:10 A.M. he reported the German fleet to the C.-in-C., then some 180 m. off, an incident which first brought into prominence the possibilities of the submarine in fleet reconnaissance work. During the summer the chief of the German naval staff was trying to persuade Scheer to modify his "harsh professional conception" of submarine warfare, and resume restricted war against commerce in accordance with prize law. The Mediterranean submarines had continued working on these lines with good results; the Flanders flotilla had recommenced on a small scale in Sept. 1916, and the operations in concert with the fleet had only resulted in the sinking of two light cruisers. The "Deutschland," under Capt. Paul König, tried a trading venture across the Atlantic during the summer, reaching America on July 9 1916 and returning on Aug. 23 with a cargo of rubber, nickel, and tin, but the "Bremen" which followed her in Sept. was lost. U53, under Lt.-Comdr. Hans Rose, a skilful and chivalrous commander, crossed the Atlantic (leaving on Sept. 17 and arriving on Oct. 7) and sunk five merchantmen off Newport News. The "Deutschland" made a second trip across, arriving in New London on Nov. 1 and reaching Germany safely on Dec. 10 1916. There her mercantile career ended, and she was fitted out as a submarine-of-war and went off to work in the Azores. Archangel too became a sphere of activity for a time, and seven ships were sunk there in Oct., but the initial success did not continue, and in Nov. U56 was sunk by Russian patrols. The German naval staff now decided that all flotillas were to resume the campaign against commerce in accordance with prize law, and orders to this effect were issued on Oct. 6 1916. Scheer had underestimated the power of legitimate warfare. The monthly average of all Allied and neutral merchant ships sunk by submarines had been 76 ships and 153,521 tons (gross) from Feb. to Sept. 1916. From Oct. 1916 to Jan. 1917 the average rose to 173 ships and 346,405 tons, and the campaign was extended with success to the Azores, Canaries and Madeira, where Funchal was bombarded on Dec. 3 by a converted mercantile.

**"Unrestricted" Warfare, 1917.**—But during the autumn Scheer and the naval staff found powerful allies for the policy

*Progress of Counter Measures.*—In the anti-submarine campaign great progress was made in technical devices, and larger depth charges were supplied in greater quantities. Type D charge (300 lb. T.N.T.) entirely superseded type D<sup>x</sup> (120 lb.), and the output was increased. Destroyers carried five or six instead of one or two; some were equipped with as many as 20 or 30, and the number of submarines sunk by depth charges rose from 8 in 1917 to 15 in 1918. Decoys (generally designated Q ships) continued effective in 1917, and five submarines were sunk by them during the year. These were merchant ships manned with a trained crew and armed with guns carefully concealed by special devices. On a submarine opening fire the ship would stop and a portion of the crew called the "panic party" took to the boats, lowering them carelessly and hurriedly in the hope that the submarine would approach and board the vessel. If she did the bulwarks fell and a deadly fire was poured into her at close quarters. Capt. Gordon Campbell was the most successful exponent of this stratagem. U38 fell to his ship, the "Pargust," on Feb. 17 1917 off the southwest of Ireland, and UC29 was sunk by her on June 7 in the same area, bringing him a V.C. His last ship, the "Dunraven," sank on Aug. 10 after a heroic action with U61, in which the after gun's crew remained steady at their post with the poop blazing under them and were blown up with the gun rather than betray the nature of their ship. The "Prize," (Lt. Wm. Sanders) and the "Stoncrop" (Comdr. Morris Blackwood) were also gallant ships, the former sinking U88 out in the Atlantic on Sept. 17 and both being sunk by submarines. By Sept. 1917 the decoy had lost its efficacy, though four were

The effects of the new campaign were quickly felt. The system under which traffic approached Great Britain on routes patrolled by ships and trawlers with a sprinkling of destroyers proved incapable of meeting the emergency. Losses of Allied merchant ships rose from 171 in Jan. to 234 in Feb., 281 in March and 373 in April. This was the black month of the war. At this rate one ship in every four that left British shores did not

still in use in the early part of 1918. From first to last it achieved the destruction of 13 submarines with the loss of some 20 decoy ships, great and small, some like the "Prize" and "Vala" with all hands. Its place was now taken by the seaplane and P boat. The latter were low boats not easily seen in mist or at dawn and were responsible for no less than four submarines in 1917. Aircraft now began to be really effective, and in 1917 six submarines succumbed to the 300-lb. bombs of large Handley-Page in the southern portion of the North Sea. British submarines too were constantly on patrol, and were able to count six submarines to their credit by the end of the year (G13 sank UC43 off the Shetlands March 10; E54 UB8 in the Atlantic May 1; D7 U45 north of Ireland Sept. 12; E45 UC79, Oct. 19; E52 UC63 Nov. 1, in the North Sea, and C15 UC65 Nov. 3, in the Channel). The hydrophone, an instrument designed to detect submarines by sound waves under water, also developed greatly, but was more useful as a detector and in controlled minefields than in actual pursuit.

The whole system of staff work was overhauled. Direction of convoys became one of the principal functions of the naval staff and the machinery of Intelligence was adjusted in this light. Intelligence of first-rate importance derived from wireless directionals had hitherto been shrouded in secrecy and locked away in drawers for the edification of the very few. The director of Naval Intelligence (Rear-Adml. Sir W. R. Hall) at last obtained control of it, and spread it abroad and circulated it to every command. The movements of all enemy submarines hitherto veiled in secrecy were displayed on a great chart in the Convoy room, and subjected to careful analysis by the new Plans Section. In Oct. 1917 this division prepared a large mine-net operation based on careful observation of submarine tracks in September. In spite of bad weather and unfavourable circumstances three large submarines (U50, U66 and U106) found their way into the minefield and were sunk, causing a scare in the Bight which sent submarines round by the Kattegat for the first time.

Plans were prepared too for mining the Bight, but it was not till Sept. 1917 that the new mines were ready in sufficient quantity. Gradually the whole strength of the High Sea fleet had to be concentrated on getting submarines in and out. An armada of minesweepers, barrier breakers, escort forces and outpost forces were constantly at work trying to keep a passage open for them along ways which extended as far as 150 m. from Heligoland. Dover still remained a thorn in the flesh. The cessation of submarine activity in April 1916 had been erroneously attributed there to the Belgian coast barrage, and a similar barrage had accordingly been laid across the Straits in the latter part of 1916. It was composed of mine-nets 60 ft. deep with a minefield in support. But the mines were of the old defective design. They dragged into the nets, sank British ships, and had to be swept up in June and July 1917. The barrage entailed enormous labour but did not close the Straits, and from Feb. to Nov. 1917 enemy submarines passed at the rate of at least 24 passages a month. This was a serious matter, for the Dover passage saved a Flanders boat eight days on the double journey to the Channel approach out of its trip of 14 days, and a Bight boat six days out of its trip of 25 days. In Oct. the whole question became acute, for Flanders boats were responsible for some 22 ships a month in the Channel. The proper antidote was a strong minefield, and the vice-admiral at Dover had suggested in July 1917 laying a deep minefield from the Varne to Gris Nez, but the new mines were not ready and could not be supplied to Dover till Nov. It was partly laid on Nov. 21, but it was not constantly and intensively patrolled so as to make the submarines dive, with the result that between Nov. 21 and Dec. 8 21 submarines made the passage in safety. This was a severe disappointment, and instructions were sent to establish a strong patrol equipped with flares and searchlights to force the submarines down. This was done to a limited extent, and on the 10th the new minefield took its first toll in UB56. But difficulties arose in the execution of the plans and the urgency was so acute that before the end of the month Rear-Adml. Sir Roger Keyes, Director of Plans, was sent to Dover to assume the command, and the next four months saw nine sub-

marines destroyed in the Dover area. By Feb. 1918 the Bight boats had ceased to use the Straits, and by May the activity of the Flanders boats in the Channel had been enormously reduced; the blocking of Zeebrugge contributed to this result, and the losses in the Channel were reduced to six a month, the minefields laid by the Flanders boats falling from 404 in 1917 to 64 in 1918.

The year 1918 saw the commencement of a much more ambitious scheme—the Northern Barrage—which aimed at nothing less than mining with 120,000 mines the huge stretch of 240 m. between the Orkneys and Norway. (See MINESWEEPING AND MINELAYING.) This was really an immense task, complicated by a deep gut some 60 m. wide on the Norwegian side where the depths ran to 150 fathoms. The credit for its conception and execution lies largely with Adml. Sims and the U.S. navy. It was an American enterprise performed by American sailors in American minelayers. As it was only commenced in April and was barely completed in Oct. its value is difficult to appraise, but the loss of some half-a-dozen boats can be attributed to it in Sept. and Oct. 1918. United States destroyers too were doing invaluable work in escorting convoys, and had been doing it ever since May 1917, during the dark months of 1917 when destroyers were more valuable than battleships.

The losses in the Mediterranean had given rise to serious concern, and the First Lord (Sir Eric Geddes) and the director of Naval Intelligence proceeded there in person to arrange for an extensive reorganization of the commander-in-chief's staff. Its clear waters, too deep for mines, and its regular tracks had been an ideal hunting ground for submarines. During 1917 only two German submarines had been lost there, and in the black month of April 1917 the Mediterranean had supplied one-fifth of the tonnage sunk. The arrival of some 14 Japanese destroyers in the summer brought the losses down about 10%, but in Dec. 1917, when vigorous action had greatly reduced the losses at home, the Mediterranean was still contributing 147,000 tons a month or over one-third of the whole. The convoy system was now introduced in the Mediterranean, the Otranto barrage was established and reinforced, and in May 1918 no fewer than four submarines were destroyed there. The effect of these measures was soon felt. Our losses in that sea were reduced from 95 ships a month in the last quarter of 1917 to an average of 43 in July, Aug. and Sept. 1918.

The U-boat zone had been extended to the Azores in Nov. 1917, and one or two boats had been working regularly there with fair results and comparative immunity till May 11 1918 when U154 was torpedoed by E35 about 150 m. west of Cape St. Vincent, an exploit directly due to improved intelligence.

Adml. von Capelle had been confident that his submarines would be able to prevent the U.S.A. troops reaching Europe, but actually not a single transport was lost up to Feb. 5 1918, when the "Tuscania" was torpedoed with a loss of only 44 lives out of 2,404. To stop the ceaseless flow of troops four large submarines were sent across the Atlantic, but though they destroyed over 60 ships they did not get a single loaded transport, and U156 was lost in the Northern Barrage on her way home. On July 19 1918 the great liner "Justicia," 32,234 tons, was hit by a torpedo from UB64 at 2:30 p.m. off the Skerryvore (Scotland, W. coast), and attacked again by U54 and UB124 the next morning. A whole armoury of depth charges was dropped round UB124 by the "Marne" and other destroyers, forcing her to the surface to surrender. All this time the mining of the Heligoland Bight went steadily on with the help of the gallant 20th Destroyer Flotilla (Capt. Berwick Curtis), and its exits were occasionally entirely closed. The Flanders flotilla felt the full force of the increased activity at Dover and suffered heavily. In Jan. 1918 it numbered 29 boats; it lost no less than 24 during the year and its strength dropped to 13. By the middle of 1918 it had earned the dread name of the "Drowning Flotilla," and its boats could reckon on a life of only three or four trips.

The Kattegat still remained open. In April 1918 a deep minefield was laid there, and had it been possible to keep it patrolled the submarines would have had to face another serious danger. How far this was practicable is a moot point.

The reports of destruction in 1918 gradually began to fall into four categories. Either a mine demolished the boat wholesale, or an aeroplane swooped down on it with 300-lb. bombs, or a volley of depth charges forced it to the surface, or a torpedo from a British submarine brought its career to a sudden end. Depth charges competed with mines as the principal instrument of destruction (destroyers and patrols 39%, mines 30%); then came the submarine 8%, with aircraft a bad last.

It is impossible to narrate the long story of destruction. UB81 may be mentioned as an example of the unenviable career of a German submarine. On her way down Channel on Dec. 2 1917 she struck a mine off the Owers (near Portsmouth) and water began to enter by the stern. An attempt was made to bring her to the surface, but the after-tanks would not blow and her stern sank to the bottom in 90 feet. The gauges showed the bows to be out of water, and with the boat lying at an angle of about 60° a torpedo was lowered from the bow tube, and a man rammed up its narrow length. The sea cap was opened cautiously and it was found that the mouth of the tube was a couple of feet above water. Men were rammed carefully up and seven men had dragged themselves painfully out, only to find the cold so bitter and the strain so great that most of them elected to go back and join those who were seeking oblivion and death in the oxygen flasks. P32 patrolling in the vicinity saw the bows above water, but in the endeavour to get alongside the wind and waves bumped her against the submarine, which went to the bottom, leaving only a solitary survivor. Two little drifters contributed their quota to the tale. On April 17 1918 a little drifter, the "Pilot Me" whose jolly name was in itself an omen of success, working in the North Channel, suddenly sighted the periscope of UB82, 150 ft. off, and turning quickly dropped four depth charges on it. The submarine came up at an angle of 45°, and three other drifters, the "Young Fred," "Look Sharp" and "Light," all opened fire on her. She went down and the "Young Fred" dropped four depth charges on her, bringing her to a final end.

*Statistics of Submarine Warfare.*—The dreary dreadful tale of ships sunk and attacked is too long to give (for dates and names see *Admiralty Return of British Merchant and Fishing Vessels Captured or Destroyed*, Aug. 1919, H.C. 199). It includes the names of nine hospital ships, all, with one exception, large ships whose character was unmistakable ("Asturias" March 20 1917, Channel, beached, 44 lives lost; "Gloucester Castle" March 30 1917, Channel, towed in; "Donegal" April 17 1917, Channel, sunk, 41 lost; "Guildford Castle" April 10 1917, Bristol Channel, hit by dud torpedo; "Lanfranc" April 17 1917, off Havre, with 167 wounded Germans, sunk, 34 lost; "Dover Castle" May 26 1917, Mediterranean, sunk, 7 lost; "Rewa" Jan. 4 1918, Bristol Channel, sunk, 4 lost; "Glenart Castle" Feb. 26 1918, Bristol Channel, sunk, 95 lost; "Llandovery Castle" June 27 1918, Atlantic). Of these the attack on the "Llandovery Castle" by U86 (Patrig) was probably the most flagrant breach of the principles of humanity. She was homeward bound from Canada 116 m. from the Fastnets (S.W. point of Ireland). The enormous red cross of a hospital ship was lit on her side, glowing in the twilight like a lustrous jewel, when she was attacked and sunk; of the 258 persons on board, including 14 nurses, all except a boatload of 20 perished.

\* (Including losses by surface craft and mines.)

In Oct. 1918 Flanders was evacuated and the remains of the flotilla blown up. It was a Flanders boat UB116 (Lt. Emsmann) which made a last desperate effort to enter Scapa on Oct. 28. It was heard on the hydrophones, and seen for a moment in the search-light beam. Then came the heavy shock of an explosion and the last of the Flanders flotilla found a fitting end in the very gates of the enemy.

When the Armistice was under discussion, Scheer, who was now chief of the German naval staff, recalled all the submarines, intending to make use of them in a last desperate sortie with the fleet, but he found himself suddenly confronted with mutiny, and the fleet never sailed, though the submarines remained true. Meanwhile in the British navy the evolution of the submarine had followed a different path. Here there was a tendency to produce a type useful in reconnaissance work and able to act in tactical conjunction with the fleet. Of E class, which did yeoman service, 49 were built and 27 lost. They were vessels of 180 ft. long with three to five 18-in. tubes and a speed of 15 knots on the surface and 10 submerged. They were followed by G class (10 built in 1916, 4 lost) with better seagoing qualities and double hulls, armed with one 3-in. anti-aircraft gun and 5 tubes (four 8-in. and one 21-in. astern); their speed was 14 and 10 knots. Of J class 7 were built in 1916-7 and 1 lost. They were 270 ft. long, carried one 4-in. and six 18-in. tubes and could do 18 knots on the surface. K class were designed for fleet work, and were completed in 1917-8 (16 built, 3 lost). They were steam-driven on the surface, attaining a speed of 22 knots, 334 ft. long, and carried one 4-in., one 3-in. A.A. gun and eight 18-in. tubes. L class carried one 3-in. A.A. and six 21-in. tubes. They were 222 ft. long with a surface speed of 17 knots. Some 25 were complete in 1918 (2 lost). Of M class only 4 were ordered. They were about 200 ft. long and carried a single 12-in. 35 calibre gun which could be fired only in the direction of the bow. The design was "freakish" and displayed a lack of tactical, strategical sense. Only one was completed. R class, of which 12 were completed (none lost), was specially designed for anti-submarine work. They were short and built for quick diving and rapid manœuvring. They carried one 3-in. gun and four 18-in. tubes. Of British submarines 54 were lost during the war:—

The question arises, How nearly did the German submarine campaign attain its aim? The increase in submarine destruction and the decrease in shipping losses possess little meaning apart from the figures of output in either case. In spite of strenuous

British effort the German submarine output more than kept pace at first with their destruction. In 1917 the net gain in submarines was approximately 45, but in 1918 the two exactly balanced (74 added, 74 lost). The shipping position depended largely on the irreducible margin which would have fulfilled British needs. This may be taken as 12½ million tons, and in addition there was always some 600,000 tons of British shipping under repair (from enemy and marine damage), requiring a total of, say, 13,000,000 tons (gross). By the end of 1918 there were 3,391 British steam vessels of over 1,000 tons, with a gross tonnage of 14,049,000.

The British shipbuilding capacity remained much the same (about 1.2 million tons a year, 1.310 million tons gross for Jan. to Oct. 1918), but net losses had been reduced to about 33,000 tons gross per month, which meant that the submarine could no longer attain its object within a reasonable time. It is true that the German output of submarines would have increased 20 or so monthly in 1919, but there is every reason to believe that the Allied navies could have dealt with it. The really critical time from Aug. 1917 to Dec. 1917 had passed. The submarine campaign had failed. On three grey Nov. days they fled along Germany's *via dolorosa* towards Harwich, bringing to a grim and sordid conclusion one of the most tremendous chapters in the history, not only of naval warfare, but of the world.

Final Tale of German Submarines in Nov. 1918.

**SUBMARINE MINES** (see 26.1).—It was the Russo-Japanese War 1903-4 which saw the first use of what has been called deep-sea mining—that is to say, the application of the submarine mine to strategic and tactical uses quite distinct from its previous application for coast defence; and that war led to the intensification of development in all maritime countries.

In the World War 1914-8 Great Britain laid a total of 130,389 non-controlled mines, 1,192 controlled mines and 25,983 of a small special type of net mine; in addition, 899 British non-controlled mines were laid by a U.S. minelayer. As showing the growing intensity of mining as the war developed, British minelayers were engaged on an average number of days in each month of 2½ in 1915, 5½ in 1916, 11 in 1917, and 20 in 1918. A mine barrage across the Dover Straits contained 9,373 mines. The great Northern Barrage from the Orkney Is. to the coast of Norway contained 69,766 mines; of this number 59,033 were American mines and laid by the U.S. minelayers. The British minelayers, who were chiefly employed elsewhere, laid the remainder. British submarines laid 2,469 mines. (See generally MINELAYING and MINESWEEPING.)

The chief naval war losses in surface ships due to the action of mines were:—

	Battleships	Cruisers	Destroyers and Torpedo Boats
Great Britain . . . . .	5	3	22
France . . . . .	1	1	5
Russia . . . . .	1	—	6
Italy . . . . .	1	—	2
United States . . . . .	—	1	—
Japan . . . . .	—	—	1
Germany . . . . .	—	2	20
Austria . . . . .	—	—	3
Turkey . . . . .	—	2	—

Mines, as distinct from depth charges, accounted for the known loss of 35 German (or Austrian) submarines.

The loss of the British mercantile marine due to mines was 673,417 gross tons, besides a loss in fishing vessels of 8,545 gross tons.

**Classification of Mines.**—Submarine mines can be divided into two general types, controlled and non-controlled. These may be again divided, each into two divisions, contact and non-contact, and these may be further sub-divided into three classes, moored, drifting and ground. A ground mine is one which is laid actually on the bottom; it is chiefly useful in shallow waters. Drifting mine may be submerged and oscillate between set depths, may float on the surface, or may be suspended below a float; they are especially suitable for employment in river warfare. A moored mine which is the type most frequently used, is a buoyant mine anchored to the bottom by a heavy weight or "sinker," the mine being attached to its "sinker" by chain or wire rope. The "sinker" may be automatic in its working and, following an adjustment which is capable of being readily made by the layer, it will take the mine to the desired depth below the surface. The depth adjustment will be made by the layer in accordance with the draft of the enemy's ships.

**Controlled mines** are those which have their firing source outside the mine and directly controllable by human agency. An electric current, provided by a dynamo or battery, is conveyed to the mines by cables led along the sea bottom from a control station on shore where the current may be switched on or off as desired. In the case of contact controlled mines a break in the controlling circuit, inside the mine, is completed when the mine is struck. Sometimes this is arranged by the crushing of a horn or it may be arranged by mechanism which acts due to the inertia of the blow. In the case of non-contact controlled mines, the firing is accomplished either by the direct observation of the operator or the mines themselves are made their own observers. In the first case the observer follows the enemy vessel through a telescope, which works over a prepared chart having metal strips on it corresponding to the positions of the mines; when a plunger on the training arm attached to the telescope comes into contact with one of the metal strips, the circuit is completed to that particular mine or line of mines and the mines are fired. Where the mines are their own operators, each contains mechanism, such as a microphone, which will pick up the sound of a ship's propellers and will indicate to the operator the moment when he should fire. The observation current from the mine is conveyed to the operator by the same cables that are used to fire the mine.

Controlled mines are specially applicable to the defence of harbours, where, by nature of their control, passage of friendly ships may be permitted but, at any time if necessary, can be denied. Contact controlled mines are used chiefly in side channels, because, although they can be put to "safe," they nevertheless foul the ground and friendly ships passing might damage them or tear them from their moorings; used channels have, therefore, to be mined with non-contact controlled mines, moored at a depth below the draft of the deepest draft ship using the channel.

Controlled mines are very costly to install and maintain and they require a large personnel to tend and operate them. (See PLATE, figs. 6 and 7, for types of non-contact controlled mines.)

**Non-controlled mines** are those which are automatic when once laid. They carry their own firing source or obtain it from the sea and have no further dependence on any human control. Mechanism is usually fitted which renders them safe during laying and for a short time afterwards, or at any time should they break adrift from their moorings. They may also be fitted with mechanism rendering them safe or disposing of them by explosion after a determined interval, and unless so fitted they must be swept up when no longer required.

There are several methods by which contact non-controlled mines are fired:—(i.) Inertia, where the momentum of the blow displaces a weight or pendulum inside the mine, causing the release of a percussion firing mechanism. (ii.) Mechanical lever, where the contact with a vessel displaces a rod or lever on the outside of the mine which first cocks and then releases a percussion firing mechanism. (iii.) Hydrostatic, where the contact with a vessel admits water, usually by the crushing of an external horn, into a valve inside the mine which acting under the water pressure releases percussion firing mechanism. (iv.) Electrical, which is usually of the well-known "Hertz" horn type, where contact with a vessel crushes an external horn which contains within it a bichromate solution in a glass tube. When the glass of this latter is broken, the solution flows to the plates of an electric battery, previously inert, situated within the mine at the base of the horn. The solution energizes the battery, which is electrically connected to the mine detonator, thus firing the mine. This type, though electrical in action, carries the energy in a chemical form.

In the case of non-contact non-controlled mines, firing can be accomplished by an observing mechanism, as for instance a microphone, within the mine; as a vessel approaches, the sound of the propellers is picked up by the microphone and by means of relay mechanism the mine can be made to fire when a pre-determined intensity of sound has been reached.

# SUBMARINE MINES

Figs. 1 and 2 show contact non-controlled mines having the horn type of firing mechanism and attached to their automatic sinkers as they would appear on board the minelayer when ready for laying. The small wheels on each side of the sinkers at the bottom engage on the rail track laid along the minelayer's deck.

Figs. 3 and 4 show similar types of mines as they would appear when broken adrift from their moorings and floating on the surface.

Fig. 5 shows a special type of horned contact non-controlled mine adapted for discharge out of a torpedo tube of a submarine.

Figs. 6 and 7 show types of non-contact controlled mines as they would appear when broken adrift from their moorings and floating on the surface.

Fig. 8 shows the explosion of a depth charge fired at a depth of 40 feet.

The object of such an arrangement is to increase the probability of the mine, but since in this case the mine is fired out of actual contact with the ship's hull, explosive effect is sacrificed for the gain in probability, a failing common to all types of non-contact mine. (Various types of non-controlled mines are shown in the accompanying Plate, figs. 1-5.)

**Minefields.**—Controlled minefields, on account of the complicated nature of material, etc., are applicable only to a limited defence of friendly shores. The mines are usually laid by small special minelayers in short lines or small groups, all the mines of a line or group being fired simultaneously where there are of the non-contact type.

Non-controlled minefields on the other hand are required on an extensive scale and in all depths of water, both for offence against the enemy and defence of friendly coasts. They may consist of "barriages" to prevent the passage of enemy vessels through definite and particular areas, "independent minefields" to inflict loss on the enemy where there is a reasonable possibility of doing so, and "mined areas," which are built up of individual minefields to inflict loss on the enemy in areas which he is obliged to use when his ships put to sea for operations or exercise. Mines are laid in lines which are either continuous or broken up into groups, but variations of a single line are more often used, especially when several minelayers are taking part in the operation together, the more usual variations being two or more parallel lines, single indented or stepped line and dog's leg line.

There are also some special forms of mining, such as the laying of "connected mines" where two or more non-controlled mines are connected together, or where, as an anti-submarine measure, the mines are suspended in nets. The object of all such systems is to increase probability, but the latter is only gained, in these cases, by complication of the material and the laying of it out.

**Minelayers.**—Various classes of vessels are employed for laying non-controlled minefields:—(a) Large minelayers with large carrying capacity for laying "barriages." (b) Fast minelayers of moderate capacity for laying "mined areas" or "independent minefields" in enemy waters. (c) Very fast minelayers and submarine minelayers for laying small minefields close in to vulnerable points.

Submarine minelayers require special laying apparatus. Surface minelayers are usually provided with narrow-gauge rails running along the deck and ending in a discharge "trap," at the stern. The "sinks" have two pairs of wheels which fit the rail gauge and each mine rests on top of its own sinker. The mines and sinkers are disposed in long tiers along the rails and as the minelaying proceeds the tiers are gradually hauled aft towards the traps, electrical power being usually employed for this purpose. On nearing the "trap" each "unit" is hauled off the face of the tier in succession and pushed into the "trap" from whence it is let go by order.

The spacing of the mines apart varies according to circumstance, but the least distance at which mines can be spaced apart is limited to the distance at which one mine, if exploded, will not damage or countermine the next adjacent. The spacing on board the minelayer is regulated by time; the interval between successive mines being let go varies according to the speed at which the vessel is steaming and the spacing being used. Where a minelayer has more than one set of rails, it is usual to drop mines alternately from each set; this is for convenience and gives more time for the loading of each "trap." (H. D. B.)

**Depth Charges.**—A development of submarine mines which came in during the World War is the engine known as a depth charge. This, as its name implies, is a charge of explosive which is detonated on reaching a given depth.

The explosive is carried in a mild-steel plate "charge case" to which rings are secured at the top and bottom for handling. A primer for detonating the main charge is secured in the centre of the charge case, round which primer lies the great bulk of the explosive charge, and immediately above the primer is secured the "pistol." The pistol is arranged to fire the charge at varying depths.

One principle by which a depth charge may be fired consists of admitting water to a chamber containing a hydrostatic diaphragm. The pressure of the sea-water acts on the diaphragm and at the set depth causes a striker to act, thereby exploding the charge. A suitable safety arrangement is of course provided, and this consists of a safety key which cannot be withdrawn until the depth charge has been adjusted for a depth setting.

Depth charges are carried in the stern of vessels, either in chutes or on a tilting tray, and can be released either hydraulically from the forebridge, or by hand. As the depth charge sinks at a rate of 10 ft. per second, it is clear that the laying vessel must maintain a certain minimum speed to ensure herself against damage by the depth charge she has dropped. This is 10 knots.

In addition to the two methods of carrying and dropping depth charges already mentioned, an alternative is provided in some ships in the form of a depth charge thrower. This consists of a steel barrel and an "expansion chamber." Into the expansion chamber is screwed an explosion tube which on firing sets up a pressure which will throw the depth charge a distance of 40 yds. with a time of flight of four seconds.

The introduction of the depth charge was brought about in 1915 owing to the complete immunity enjoyed by a submarine immediately on submersion, notwithstanding the knowledge of a surface vessel

that the submarine was in its immediate vicinity. The introduction and rapid development of the depth charge entirely removed this sense of security, and quite apart from the destruction of 34 submarines actually achieved by this means, it produced a very great moral effect upon hostile submarines, and hampered them in attacks upon surface craft, owing to their perception of the risk of allowing their periscopes to be sighted, and thus drawing down a rain of these depth charges upon them.

Though depth charges generally cannot be depended on to vitally damage a submarine outside a range of about 30 ft. (depending on the weight of the charge), the effect on the nerves of a crew of a series of heavy explosions at a greater distance than this fatal limit is very marked, and may be regarded as one of the great uses of this weapon. In many cases in which British submarines have been subjected to a depth charge attack, the force of the explosion has caused an immense concussion inside the boat. Fig. 8 in the accompanying Plate shows the explosion of a depth charge at 40 feet. (B. A.)

**SUDAN** (see 26.9).—The countries of the western and central Sudan are treated under their distinctive names; the present article deals with the Anglo-Egyptian Sudan, which, following official usage, is called the Sudan simply.

The area administered by the Sudan Government, enlarged during 1910-6 by the addition of the Lado Enclave and Darfur, was officially given in 1921 as 1,014,000 sq. miles. In the same year the pop. was estimated at over 4,000,000, which compared with an estimate of 1,853,000 in 1905. Nearly half the people are primitive negroid tribes living in the equatorial belt. Khartum, including Khartum North, had 39,056 inhabitants in 1921; Omdurman 59,429.

**Economic and Social Conditions.**—The years 1910-2 were years of prosperity, so much so that in April 1912 Lord Kitchener declared that "there is now hardly a poor man in the Sudan." But in that year the country experienced low floods and poor rains, while the 1913 Nile flood was one of the lowest on record. The rains, scanty at the best, failed altogether in some districts. The result was that 1913 and 1914 were years of acute agricultural and trade depression—1914 was described as perhaps the most difficult, from the point of revenue and the economic situation, experienced in the history of the Sudan. Trade suffered another shock with the outbreak of the World War. Abundant rains in the autumn and a high Nile happily resulted in providing the country with an ample supply of food-stuffs. Yet 1915 was little better than 1914. War conditions and the scarcity of shipping had caused a much lessened demand for the produce of the country. The cultivators, who form the majority of the people, "while they had enough to eat, were short of ready money" and hard pressed to pay their taxes. European conditions were indeed closely reproduced in the Sudan so far as commerce and economics were concerned. This was seen in 1916 when a period of comparative prosperity set in, though this was also due in part to abundant rains and a good flood in 1915. "The influence of the war," said the official report issued in 1920, "which had had such a depressing effect on trade in 1914 and 1915, began to operate in the reverse direction, and a great impetus was given to the export trade through an unprecedented demand for Sudan products. The presence of a large body of British troops in Egypt requiring grain and live stock, the demand created on the Arabian coast for Sudan millet, and in England and Allied and neutral countries for cotton and gum enabled all these commodities to be disposed of freely."

The experience of 1916 was repeated in 1917 and 1918 and, although there was a low Nile and poor rains in 1918, the country suffered no serious setback in 1919. Conditions in 1920 were influenced by the world depression in trade, nevertheless the year (following average rains and a medium flood in 1919) proved one of fair prosperity.

In considering the productivity and industry of the country it should be remembered that the Sudan consists of three natural zones, the desert zone in the north, where cultivation is only possible in a narrow strip on either bank of the Nile; a central zone where there are large areas of fertility, including the rainlands of Kassala and of Tokar, the Gezira plain, the pastures and gum-forests of Kordofan; and a southern belt, where the soil is richest and the rain tropical. But this southern

belt up to 1921 yielded very little, for the negroid tribes which inhabit it showed scant inclination to do more than supply their own needs, while the lack of communications over enormous distances and the difficulties of administration rendered development by outside agencies extremely hazardous. Timber was, however, obtained from the forests of the Bahr el Ghazal and Lado and a (diminishing) quantity of ivory.

Apart from the tribes of this southern zone—and even among them progress in civilization was made—the people of the Sudan, negro and "Arab,"<sup>1</sup> showed willingness, in many cases eagerness, to benefit by Western civilization. Their standard of living became more exacting and their desire for education greater. Moreover, the possibilities and advantages of trade, through the World War, had been brought home to a larger number of the population than before. "There has been," wrote the governor-general, Sir Lee Stack, in April 1920, "an advance in energy and initiative, particularly among those who make their living by cultivation."

**Products and Trade.**—Gum arabic is perhaps the most characteristic product of the Sudan, which provides the bulk of the world's supply. Formerly the only Sudan product in which Germany had a direct interest, the largest share of the gum trade is now with Great Britain. In 1913 the export of gum was 336,000 kantars, it fell to 258,000 kantars in 1915 and was 344,000 kantars in 1919 (a kantar equals 99·049 pounds). The value of the gum varied in the period named from £E314,000 to £E744,000. The principal crops are durra (millet) and cotton. As the area cultivated depends upon an uncertain rainfall and an equally uncertain Nile flood, the amount produced is liable to great variations. In 1915 the total area under cultivation was 2,463,000 feddans, in 1916 it fell to 1,480,000 feddans, was over 2,000,000 in 1917 and but 1,660,000 in 1919 (a feddan equals 1·038 acre). Nor in respect to durra does the export correspond to the crop raised. Much of the grain is home-consumed and only the surplus sent abroad. The durra exported in 1913 was 2,080 tons; in 1914 only 530 tons. Exports rose to 84,000 tons in 1917 and fell to 1,650 tons in 1919. The total export of durra for the five years 1915-9 was 245,300 tons, against 53,500 tons in 1910-4.

Great expectations were held as to the development of the area under cotton by irrigation, but the financial situation created by the war rendered any large extension impossible for the time being. The variation in output was great—9,400 bales (of 400 lb.) in 1914; 23,900 bales in 1915; 12,300 bales in 1919. The total export of cotton in the 10 years 1910-9 was 161,000 bales. The yearly fluctuation was mainly due to the variation in the crop of flood-grown cotton in the Tokar district, Red Sea province. Only by irrigation works and by the building of railways to afford the cotton districts rapid and cheap means of access to the world's markets could any great increase of the crop be expected (see below: *Irrigation and Communications*).

Besides gum, cotton and durra the chief exports were cattle and sheep, hides and skins and sesame. The extent to which the export of live stock was stimulated during the war is shown by the following figures: Total number of cattle exported 1910-4, 64,400; in 1915-9, 129,500. In the same periods the number of sheep exported was 459,000 and 648,000 respectively. The export of hide and skins, however, decreased, being 1,928,000 in the five years 1910-4 and 1,552,000 in 1915-9. The very large number of camels exported for the use of the Egyptian Expeditionary Force is not included in the trade returns. Supplies of ivory decreased; 2,792 kantars were exported in 1913 and only 1,105 kantars in 1919. Dates, wood, charcoal, gold and senna were minor exports.

Three-fourths of the total exports go in the first place to Egypt, whence a considerable proportion is reexported to Europe. Nearly all the rest of the exports go to Arabia, Abyssinia or Eritrea. Imports consist mainly of textiles and food-stuffs. An indication of the increased purchasing power of the people was the rise in the value of the imports of cotton fabrics, sugar, tea, coffee and spices. Those imports were valued at £E684,000 in 1914 and at £E2,062,000 in 1918. Imports come mainly from Great Britain and Egypt (each about 30%) and India and Aden (about 15%). South Africa (chiefly coal and sugar) and Abyssinia supply most of the other imports.

The following table shows the value of external trade (excluding specie) in the years named:—

Year	Imports	Exports (including Re-exports)	Total
1910	£E1,348,000	£E 977,000	£E2,325,000
1913	2,109,000	1,278,000	3,387,000
1918 <sup>2</sup>	4,024,000	4,210,000	8,234,000
1919 <sup>2</sup>	4,805,000	3,009,000	7,814,000

<sup>1</sup> Most of the "Arab" tribes in the Sudan are of Hamitic stock.

<sup>2</sup> Includes for 1918 Government imports £E988,000, and for 1919 Government imports £E1,804,000.

**Irrigation.**—The cultivator in the Sudan depended mainly on the rainfall and only to a less extent on the Nile flood and on artificial irrigation. While these conditions continued the area cultivated, in a year of good rains, could not much exceed 2,500,000 feddans, while cultivable land, given irrigation, has been estimated as high as a fourth of the total area of the Sudan. The Sudan Government elaborated schemes for irrigating a small portion of this uncultivated land, namely the Gezira plain and the Tokar area. In addition they embarked in 1909 on a scheme for irrigating an additional 100,000 feddans in the Dongola province by annual flooding on the basin system. In 1917, as an emergency measure to meet war needs, some 19,000 feddans in Berber and Dongola provinces were put under cultivation by means of pump irrigation.

The Gezira scheme was of much importance. The Gezira (=island) is the land lying between the White and Blue Niles. It was originally proposed to irrigate 100,000 feddans. Experiments undertaken in 1911 at Tayiba, near Wad Medani, on the Blue Nile, having proved conclusively that Egyptian cotton of the best quality could be grown commercially in that district, irrigation work was started early in 1914, with funds advanced by the British National Debt Commissioners. The intention then was to raise in London a loan of £3,000,000 to meet the expense of the work, but owing to the World War the scheme had to be held in abeyance. Eventually, in 1919, a loan of £6,000,000 was authorized by the British Parliament, £4,900,000 to be spent on the Gezira works. Meanwhile it had been decided to increase the area to be irrigated to 300,000 feddans. The Gezira scheme provided for the erection of a dam on the Blue Nile at Makwar, near Sennar, so as to raise the river to a level sufficient to feed a great canal excavated across the plain. Work on the canal, the levelling survey and the necessary buildings was continued at a snail's pace (owing to war exigencies) until 1917, when a fresh start was made. In the interval the Egyptian Government had intervened with irrigation projects intended for the benefit of Egypt, and in 1916 investigations were conducted in connexion with the water supply of both the Blue and White Niles. The result was a larger project, for which Sir Murdoch Macdonald, then adviser to the Egyptian Ministry of Public Works, was responsible. In addition to the Gezira scheme it was decided to build a dam across the White Nile at Gebel Aulia about 24 m. south of Khartum, which should be able to hold up nearly double the quantity of water stored by the Aswan dam—this White Nile dam being for the benefit of Egypt. Drawings of the two dams, both engineering works of the first magnitude, were completed in 1917. Consent having been found at a convenient spot near Makwar, a factory was erected there in 1919, and the preliminary work pushed forward on both dams, some of the workmen engaged being brought from the Yemen. Sir William Willcocks, the engineer of the Aswan dam, having very severely criticized the schemes, a Nile Projects Commission, composed of eminent engineers unconnected with the Egyptian or Sudan services, made a thorough investigation during 1920. The commission reported that both schemes were sound and the last obstacle to the building of the dams appeared to be overcome. In 1921, however, the Egyptian Government was compelled, owing to the serious financial situation, to order the discontinuance of work on the Gebel Aulia dam; the Gezira operations were continued but at a greatly reduced rate. Up to June 30 1921 some £E3,264,000 had been spent upon the Gezira schemes. Meanwhile a proposal to increase the Sudan loan to £9,500,000, owing to the increased cost of labour, material and transport, had been rejected. The Tokar area irrigation works, for which only £140,000 was estimated to be needed, were continued.

**Communications.**—As a corollary to the irrigation schemes at Tokar a railway from that town to the seaport of Suakin was sanctioned in 1919. The distance is about 60 miles. The railway south from Khartum to Sennar and thence, crossing the White Nile at Kosti, westward to El Obeid, the capital of Kordofan—a distance of 428 m.—was completed in 1911. It had the immediate effect of stimulating the trade in gum arabic for which Kordofan is famous. Both railways and steamers are State-owned; in 1918 the steam department, which controlled the whole of the river traffic on the White and Blue Niles and their tributaries south of Khartum, was incorporated with the railways department, which had taken over the administration of the harbour of Port Sudan in 1914. The chief difficulty of the department during 1914-20 was in maintaining regular services efficiently. Great difficulty was experienced in keeping the Bahr el Ghazal free from sudd blocks, which caused much delay to steamers.

The upkeep of existing roads and the building of new roads entailed heavy labour and expense. In the northern and central zones wells had to be dug to make many of the tracks usable; in the south there was superabundance of water and dense forests to be cut through. One of the most important trade roads was that from Rejaf—the southern limit of navigability of the Nile from Khartum—westward to the Belgian Congo border. Good work was done on this road in 1916-8. Eighty streams had to be crossed in 125 m.; a single-span steel bridge 193 ft. long was erected over the river Yei. The difficulty of keeping the roads practicable in the equatorial regions in the long rainy season was great. It was largely on the opening-up of roads, and more roads, that the complete pacification of the southern provinces depended. From 1916 onward experiments

were made in the use of motor tractors and cars on the roads, with at first but moderate success. In 1920 the use of aeroplanes by officials for visiting distant posts was first recorded. This followed the laying-out in 1919 of a number of aerodromes and the passage in Feb. 1920 of aeroplanes engaged in the first Cairo to Cape flight. This flight led to the discovery, from the air, by Dr. Chalmers Mitchell, of the volcanic character of a range of hills in the Bayuda desert (see AFRICA: Exploration).

On the conquest of Darfur the telegraph system was extended to its capital El Fasher. Telephone exchanges are established in the chief towns. The first wireless telegraphic stations were erected in 1915—at Port Sudan, Malakal, Nasser and Gambella, a chain extending from the Red Sea to S.W. Abyssinia. In 1916-8 five other wireless stations were erected, three in Darfur, the others in the far south, at Wau and Mongalla.

**Finance.**—The subvention in aid of civil expenditure made to the Sudan by the Egyptian Government, which began in 1899 with an allocation of £E.156,000, reached its maximum in 1902 with £E.268,000, after which it was gradually reduced. In 1912 it stood at £E.163,000. In 1913 it ceased to be paid in accordance with an arrangement by which the Egyptian Government credited the Sudan with the amount of the customs collected in Egypt on goods entering and issuing from the Sudan, estimated at £E.85,000. The Egyptian Government, however, continued to defray military expenditure on account of the Sudan, estimated at £E.172,000. The insufficient rains and low floods with other external factors exercised an adverse effect on the economic situation just when the subvention was withdrawn. Nevertheless, the Sudan budgets of 1913-4-5 closed with a slight surplus. The more prosperous conditions which followed eased the situation and allowed an increase of taxation without impairing trade. Revenue, which in 1911 stood at £E.1,664,000, rose in 1919 to £E.2,950,000, with a surplus over expenditure of £E.267,000. The budget for 1920 was balanced at £E.3,500,000. A traders' tax was imposed in 1913, the trading community as a class having up to then paid nothing in direct taxation. In 1919 £E.6% was payable on assessed annual profits exceeding £E.500. In 1917 an excise duty was imposed on sugar, in 1919 the duty on tobacco was raised; heavy increases were made in railway and steamer rates both for goods and passengers. The railway and steamer services yielded a substantial profit (£E.210,000 in 1915, £E.286,000 in 1919). The rise in the price of all commodities was the main cause of the increase in taxation. The surpluses obtained since 1916 were passed to a reserve fund, the only source available, apart from borrowing, for capital expenditure. On Jan. 1 1920 the reserve fund amounted to £E.426,000 only, the "reserve" being almost wholly expended year by year on necessary works.

**Education.**—The Government schools are all in the northern or Moslem half of the Sudan; the only schools among the pagans in the southern half are those of the missionary societies. In the north there was a considerable increase in the number of boys attending elementary vernacular schools, while the sending of girls to schools became more popular with parents. There were in 1919 five elementary girls' schools, besides higher schools for girls managed by missionaries. There was after the war a considerable demand for boys with a technical or industrial education. In 1920 over 400 boys trained in the Gordon College workshops were in employment, as to three-fourths in Government service. (F. R. C.)

**Political History.**—The political status of the Anglo-Egyptian Sudan remained in 1921 as defined by the treaty between Great Britain and Egypt of Jan. 18 1899. Although the country passed through a period of depression in 1913-5, comparing 1920 with 1910 there was a distinct advance in the well-being and resources of the people. The recovery from the disastrous rule of the Mahdi and Khalifa was shown by the large increase in population. The period 1910-20 was also notable for a marked growth of confidence in the Government. The loyalty of the leading chiefs and notables was never in doubt, and throughout the World War the vast majority of the people remained peaceful and contented. The number of minor operations undertaken both before and after the war were mainly against primitive tribes in the far south and did not affect the more highly developed provinces.

By the annexation of Darfur in 1916 (see below) the area under the control of the Sudan Government was increased to over 1,000,000 sq. miles. This vast region was administered in 1921 by some 110 British officers and officials, assisted by a technical staff. The military establishment included 14,000 men of the Egyptian army, with one British infantry battalion and a detachment of garrison artillery at Khartum. A new unit, the Western Arab Corps, was raised for service in Darfur.

The Lado Enclave (see 16.60) was transferred in 1910 from the Belgian Congo to the Sudan and added to the province of Mongalla. In the same year an outbreak of the old fanatical

spirit had to be suppressed in Sennar, and during 1910-2 minor expeditions dealt with local disturbances in Kordofan and Mongalla. Others were also undertaken in 1914-8 to deal with turbulent elements in the Nuba Mountains—traditionally obnoxious to authority—and to keep order in the equatorial regions, where the Nuer and Dinka tribes gave a good deal of trouble. The most important of these operations was in the Nuba province in 1917-8. After a number of collisions, in which Capt. R. W. Hutton was killed (April 1917), a considerable force was sent in the autumn of that year and after a somewhat arduous campaign the hill tribes were in Feb. 1918 reduced to submission. In 1918 the Sudanese troops aided in operations against the warlike Turkana, a tribe, much given to raiding, living on the Sudan-Uganda border. Unfortunately neither the Sudan nor the Uganda Government had forces to spare to station troops permanently in this remote area.

An incident at Kassala towards the end of 1918 of no political importance is yet noteworthy as illustrative of the sporadic outbursts of fanaticism to which parts of the Sudan were liable. It was thus officially recorded:—

"Without a word of warning and in the dead of night a band of some 40 fanatics, led by a religious lunatic, suddenly rushed the guard and infantry picket furnished by the Egyptian unit on the fort and then proceeded to attack the lines of the camel company of the Eastern Arab Corps. No longer aided by the element of surprise, the band suffered heavily in killed and wounded at the hands of the latter unit. The leader was amongst the killed and the few that escaped were ultimately accounted for by the camel company and the police."

Aggressive action by the Aliab section of the Dinkas in Mongalla province led to the despatch of a small force in 1919 under Maj. R. F. White, which was accompanied by the governor, Maj. C. H. Stigand. An attack by spearmen in the long grass led to the death (Dec. 8 1919) of these two valuable officers and other casualties, entailing a punitive expedition in the following year.

The completion of the railway from Khartum to El Obeid, the capital of Kordofan, in 1911 enabled the Government better to control Darfur, where 'Ali Dinar ruled as a Sultan tributary to the Sudan; and, after the French occupation of Wadai, negotiations were in 1912 opened with France for the determination of boundaries by the inspector-general, Sir Rudolf von Slatin, on behalf of Great Britain and Egypt.

In Jan. 1912 King George and Queen Mary paid a visit to Port Sudan on their return journey from India, and a review was held at Sinkat by the King, at which representatives from almost every section of the Sudan were present. The scanty rainfall and abnormally low Nile of 1913 caused famine conditions in portions of Dongola and the Blue and White Nile provinces. Relief measures and the importation of large quantities of millet from India made a most beneficial impression on the populations affected. In April 1914 an exchange of certain districts on the Upper Nile was effected, in the interests of both administrations, with the Uganda Protectorate (see UGANDA).

On the outbreak of war with Turkey in Nov. 1914 the various provinces of the Sudan, notwithstanding the Moslem character of the majority, displayed perfect loyalty to the administration. In Darfur, on the other hand, the Sultan 'Ali Dinar renounced his allegiance, and, instigated by Turkish emissaries working through the Senussi sect, contemplated an invasion of the Sudan. His communications with the Senussites were cut off by posts of irregulars, and early in 1916, military operations were undertaken which led to the defeat and subsequent death of 'Ali Dinar (for the military operations, see SENUSSI). Darfur was thereafter administered as a province, and an Anglo-French convention, signed at Paris on Sept. 8 1919, at length settled the common frontier of Darfur and Wadai. The occupation of Darfur was followed by an expedition in coöperation with the French in the region north of Darfur against marauders of the Guraan tribe, who had given considerable trouble to both administrations. A garrison for Northern Uganda, whence troops had been withdrawn to meet the menace from German East Africa, was for a brief period provided by the Sudan Govern-

ment. Except in Darfur, the war did not, externally, touch the Sudan at any point, and its administration continued on normal lines. The Prince of Wales visited the Sudan in 1916 and the Duke of Connaught in the following year.

The disturbances which broke out in Egypt in 1919 interrupted direct communications with Cairo, and the temporary cessation of Nile traffic caused a certain loss of trade. The Sudanese populations were not concerned with the aspirations of Egyptian nationalism, and the large Egyptian official community, while by no means indifferent to the development of events in their own country, did not actively display sympathy, so that this period of crisis passed without incident. Nor did the Armistice and the negotiations which followed the victory of the Allies occasion special comments. A delegation of Sudanese notables proceeded to England to offer congratulations on the successful termination of the war and returned with pleasant impressions of their visit. The only remaining centre of unrest in 1921 was the Abyssinian border, where raids and hunting parties of chiefs, nominally but not effectively under Abyssinian control, continued to give difficulty.

The outstanding event in Sudanese history during the war period was the withdrawal of Sir Reginald Wingate from the governor-generalship, on his being called to Cairo in Dec. 1916 as high commissioner for Egypt. He succeeded Lord Kitchener as Sirdar of the Egyptian army and governor-general in Dec. 1899, after an almost continuous service with the Egyptian army since 1883. Under his able and sympathetic administration the Sudan had emerged from the chaotic condition to which Mahdist misrule had reduced it, and gradually developed into a peaceful and contented country. His name will long be remembered by the people to whose regeneration he devoted the best years of his life. Another historic association with the Sudan was terminated by the outbreak of war between Great Britain and Austria-Hungary, when Sir Rudolf von Slatin, the inspector-general, whose advice in all native affairs had been most valuable, was inevitably compelled to resign. Mention may also be made of the resignation of Sir Edgar Bonham-Carter in 1917 after 18 years' service. He had been responsible for the creation and development of the whole legal and judicial system of the Sudan.

Col. (afterwards Maj.-Gen. Sir) Lee Stack, civil secretary to the Sudan Government, succeeded Sir Reginald Wingate as governor-general and sirdar; Slatin Pasha's post was not filled.

See the Annual Reports on the finances, administration, etc., of the Sudan, issued annually in London up to 1913, and the Report for 1914-9, issued 1920, which is of special value. The *Sudan Almanac and Handbook to the Sudan* are also official publications. Murray's *Guide to Egypt and the Sudan*, and Macmillan's, Baedeker's and Lock's guide-books may be used with profit. See also Y. P. Artin, *England in the Sudan* (1911); and *Sudan Notes and Records*, an excellent serial publication begun in 1918. The Survey Department, Khartoum, issues a map of the Sudan, in many sheets, on the scale of 1:250,000. (J. R. R.)

**SUDERMANN, HERMANN** (1857- ), German dramatist and novelist (see 26.20). His novels include *Das hohe Lied* (1906); and *Litauische Geschichten* (1917); while in 1911 appeared a volume of short stories, *Die indische Lüge*. His later plays include *Strandkinder* (1910); *Der Bettler von Syrakus* (1911); *Der gute Ruf* (1913); *Die Lobgesänge des Claudian* (1914); and *Das Höhere Leben* (1919).

**SUESS, EDUARD** (1831-1914), Austrian geologist (see 26.21), died at Vienna, April 25 1914.

**SUEZ CANAL** (see 26.22).—The five years 1909-13 witnessed a considerable increase in the traffic passing through the canal. The World War greatly restricted the use, particularly in 1917.

In the following table the figure for receipts is obtained by taking 25 francs as equal to £1 sterling except for 1920, when the rate is reckoned at 50 francs to the £1:—

	No. of vessels	No. of passengers	Net tonnage	Gross receipts
1909	4,239	213,122	15,407,527	£4,782,724
1913	5,085	262,235	20,033,834	£5,140,403
1917	2,353	142,313	8,368,918	£2,880,761
1920	4,009	500,147 <sup>1</sup>	17,574,657	£5,329,213

<sup>1</sup> This abnormal increase was due to the movement of troops.

In Feb. 1915 the Turks, who had traversed the Sinai peninsula, attacked the Suez Canal at various points, and it was not until after the battle of Romani in Aug. 1916 that all danger to the canal was ended. Throughout this period traffic was interrupted on two occasions only, and then for very brief periods. During the World War, under Adm. Robinson as Director-General of the Egyptian Ports and Lights Administration, 1,239 transports and men-of-war, totalling over 8,000,000 tons, were passed in safety through the canal, and 965 transports, 43 hospital ships, 36 store ships and 307 colliers were dealt with at Port Said.

Striking differences in the pre-war and post-war shipping were the elimination temporarily after 1914 of German vessels (which in 1911 had 13.4% of the tonnage) and the increasing number of Japanese and United States ships using the canal. Japanese vessels represented before the war 1.7% of the tonnage; in 1920 their tonnage had increased to 9.1%. United States vessels, rarely seen in the canal before the war, in 1920 represented 4.1% of the tonnage. British ships continued to provide the bulk of the tonnage, the proportion in 1920 being 61.7% compared with 62.2% in 1911. In 1920 three passages were made by steamers of over 23,000 tons gross, a figure never before reached, and one vessel had a length of 669 ft., the longest registered in the canal. The quantity of goods passing through the canal in 1920 was 34% below the figures of 1913. There had been some change in the character of the merchandise, food-stuffs diminishing sensibly in volume, though corn from Manchuria and China made its appearance. Imports of coal from S. Africa and Australia were particularly marked in 1919 and 1920.

A scheme to extend the concession of the Suez Canal Co.—the existing concession does not expire until 1968—was rejected by the Egyptian General Assembly in 1910, not on its merits but in an effort to discredit the British administration. The Suez Canal Co. cooperated heartily with the British authorities in Egypt during the war. To meet the increased costs caused by the war the Company in 1916 and 1917 imposed higher tariff charges, which, after the war, acted in restraint of traffic and were not of permanent benefit to the Company. In 1919 the Company asked to have put into operation at Port Said the free zone regime provided for in an agreement made in 1902 between it and the Egyptian Government. It held that the transit trade would be stimulated if an area were set apart in which goods could be handled, or remain, uncontrolled by the customs. An agreement on the subject was drawn up in 1920.

It is noteworthy that in 1919, and to a much more marked extent in 1920, the Company benefited by the decreased value of the franc. This was made possible as shipping dues were collected in Egypt and were paid in money less depreciated than the franc, and profits earned in Egypt were used in the purchase of francs at current rates. In 1920 the benefit from these operations amounted to 101,772,000 francs, or over £2,000,000 at average rates of exchange. The annual reports of the Suez Canal Co., published in Paris, give full statistical information. (F. R. C.)

**SUGAR** (see 26.32).—In the year 1910-1 the world's production of sugar amounted to 16,951,000 tons, of which 8,391,000 tons were produced from cane and 8,560,000 tons from beet, including that grown in America. For 1913-4 the world's total production reached 18,486,000 tons, of which the cane production was 9,577,000 tons—an increase of 1,186,000 tons of cane. The beet crop for the same period was 8,909,000 tons, of which 655,000 tons were grown in America—an increase of 349,000 tons. These were the highest figures reached during the decade 1910-20, for after the outbreak of the World War in 1914 the European production declined yearly, until in 1919-20 the world's beet crop reached only a little over 3,200,000 tons, of which 653,000 tons were American. The world's crop of sugar for 1920-1 was estimated at about 16,475,000 tons, of which cane was estimated to produce over 11,828,000 tons, and beet 4,647,000 tons, of which 935,000 tons were American.

Owing to the British Government recognizing at once the importance of securing to the nation a supply of sugar sufficient for the wants of the people, sugar was the first commodity to be controlled in the United Kingdom during the war (see FOOD SUPPLY), and within a few days of its outbreak the Government had bought several thousand tons of sugar. In Aug. 1914 a Royal Commission on the Sugar Supply was formed. It took over the duties of buying and selling sugar. These operations were done through the ordinary channels of trade, and everyone was guaranteed a

supply on the basis of his trade before the war, the actual quantities being fixed from time to time in proportion to the sugar held by the Government; and it is not too much to say that the sugar control was the most successful of the many Government controls.

It may be noted that in the Final Report of the Commission issued in June 1921 it was stated that: "The wisdom of the Government in at once taking over in 1914 responsibility for the sugar supply was, in our opinion, fully proved in the sequel. But while we recognize that in the special circumstances State management was a necessity, our experience does not lead us to think that State control is a desirable thing in itself in the region of trade in commodities."

The total consumption of sugar sold under control was approximately as follows:—

	Tons
1915	1,818,488
1916	1,314,910
1917	1,219,761
1918	1,109,995
1919	1,595,004
1920	952,408

The stocks held by the Commission on March 31 1921 were 390,479 tons of raw and 57,787 tons of white.

The Commission had desired to carry out their operations free of cost to the Exchequer. "This aspiration cannot now be realized," they add, "but the fault is not ours. From time to time since the middle of 1919 the Commission has on various occasions pleaded for an increase in the selling prices of its sugars, so as to build up a reserve to meet the loss which it foresaw as probable on the liquidation of its stocks on the conclusion of its operations. But on no occasion has a rise been authorized until weeks or months after it was recommended, and then not always to the extent recommended."

"From a calculation we have made we are able to say that if our recommendations (which were always kept as low as possible in view of the reluctance shown by the Cabinet to an increase in prices) had been approved at the time they were made our receipts would have been £16,000,000 more than they have been in fact. Even that sum is less than the deficit which it is probable that the Exchequer will have to meet on our operations, and which we estimate at not less than £24,500,000. Some may perhaps hold that it is not of material importance to the public whether it has to bear a burden of this kind in its capacity as a taxpayer or in that of a consumer of sugar. But to us it is a matter of regret that we shall not be able to claim that we discharged the duties imposed upon us without having recourse to the funds of the Exchequer otherwise than for the purpose of the temporary financing of our operations. The advances made to us under this latter head by the Treasury stood on March 31 at £27,281,937."

The cost of the establishment of the Commission from 1914 to 1922 is given as £103,239.

The year 1920 stands out as having the most violent fluctuations the sugar trade has probably ever experienced. The British Royal Commission on the Sugar Supply and the American Equalization Board acted conjointly in 1919, and by their actions controlled both the American and European markets. Prices were kept between 30s. and 63s. per cwt. for Java 96° F.L., but there was some hesitation in the autumn with regard to the continuation of the operations of the American Equalization Board, which did not decide on further action until December. In the meantime a good deal of the Cuban crop had been sold to Europe and the East on a basis of 6½c. per lb., and when the American Equalization Board decided to continue control it was too late to secure the Cuban crop. The planters, having sold a certain quantity of sugar, were independent, and prices were forced up to 12c. (equal to 76s. 9d. per cwt.) at the end of January. In Feb. there were, however, large offerings on the part of the Cuban planters, owing to supplies of sugar coming into the market, and quotations declined to 9c. (equal to 59s. 3d. per cwt.). In March the American refiners began to buy freely, and this increased demand was intensified by two serious reductions in the estimate of the Cuban crop. Wild speculations took place, and in May as much as 23½c. (equal to 136s. per cwt.) was paid. Large purchases were also made in Jan. and May of Manila sugar for shipment during the summer months. The effect of these inflated prices brought its own remedy; consumption decreased rapidly both in England and in America, and by the end of July Cuban prices had fallen to 16c. which was equal to a fall of 40s. per cwt. This fall continued until, at the end of the year, Cuban sugar was actually sold at 3½c. per lb., or equal to a total fall from the highest point of over 110s. per cwt. The result of these heavy fluctuations caused a financial crisis in the trade. Enormous losses were suffered by the American and Canadian refiners, who had bought and sold heavily for the autumn months, and these forward sale contracts were largely repudiated when the time came for delivery. The British refiners, being still under control, escaped these violent losses.

The values of refined sugar in 1910 varied from 17s. 3d. to 23s. 6d. per cwt. for Tate's cubes, and in 1911—the year of exceptional

drought—prices continued to advance to 27s. 6d., but towards the end of 1912 prices declined to 19s. 3d. and with slight fluctuations prices were further reduced at the outbreak of war to 17s. 9d. There was then a steady rise, and in 1914 cubes were sold at 35s., and granulated at 30s. per cwt.; in 1915 cubes were 50s. and granulated 33s., and then by gradual stages till, for domestic consumption, cubes in 1920 reached 116s. and granulated 112s., but, under the voucher system which was in vogue during control, the prices of sugar for manufacturing purposes were from 160s. to 164s. per cwt. Refined sugar produced by the British refineries from 1910 till the outbreak of war averaged about 45% of the total consumption, but after the war the production was about 74%. The British duty from 1910 till 1914 was 1s. 10d. per cwt., in 1915 9s. 4d. per cwt., in 1916 14s. per cwt., and in 1918 it was increased to 25s. 8d. per cwt., at which it remained in 1921. This was out of all proportion to the value of the sugar, and naturally checked consumption.

In 1913 the British Government withdrew from the Brussels Convention, which had been adopted in 1903, after many years' endeavour on the part of Great Britain to counteract the effect of the system of continental bounties on beet sugar. The adoption of the Convention had undoubtedly saved the British West Indian sugar trade from extinction, and British sugar refiners were able to compete on more equal terms. At the same time there was still strong opposition in England from the Free Trade party, who were anxious to have sugar at any price, whatever injustice might be inflicted on the British colonies and the home refiners. In 1911 there was a serious falling-off in the European beet crop, and there was a large deficiency in the world's supply, so that an inevitable rise in price took place. Russia, however, had large stocks on hand, which, under the Convention, could not be imported into England owing to the fact that prohibition was in force instead of countervailing duties. Had there been countervailing duties the sugar would have been shipped to England and the difference in duty paid. Giving way to pressure from those who were anxious to get cheap sugar irrespective of the reason for the cheapness, Mr. Asquith's Liberal Government gave notice in Aug. 1912 to withdraw from the Convention. The curious feature was that, as the result of this notice, Russia was permitted to send a considerable quantity in excess of the limit laid down by the Convention, but the quantity she sent had very little effect in making up the shortage of about 1,700,000 tons of the world's production.

In 1919 Mr. Lloyd George's Government (with Mr. Chamberlain as Chancellor of the Exchequer) took a further step in accordance with the views of the British West Indian planters, and agreed to give preferential treatment to sugar produced within the British Empire, in the form of a reduction in its case of one-sixth off the import duty on sugar. The British preferential duty on raw sugar at 96° polarization is equal to a preference of about 3s. 9d. per cwt., and on white sugar of a polarization over 98° 4s. 3.33d. It was too soon in 1921 to know what permanent effect this concession would have upon the production of sugar in the British colonies, but it was hoped that it would enable their planters to compete with Cuba and other countries where costs are considerably less, and consequently secure a larger share of the sugar trade of the United Kingdom.

Since 1910 serious attempts have been made to grow beetroots in England for the manufacture of sugar. A factory was erected in 1911 in Cantley, in Norfolk, but was worked only one season, and was closed during the war. It was purchased by a private Liverpool firm in 1920. A fair quantity of beetroots was grown in the immediate neighbourhood, but the high price which was given for the roots made it impossible for the purchaser to make a profit on the sugar produced. As a matter of fact a loss of from £60,000 to £70,000 was incurred. A further and more ambitious attempt was in 1921 being made at Kelham, Notts, where a large factory was erected, considerable quantities of beets having been planted in the neighbourhood. The British Government not only subscribed £250,000 of the capital, but also guaranteed interest on the amount of public capital raised at 5% for 10 years, and took £125,000 of second debentures.

See also FOOD SUPPLY and RATIONING.

(L. A. M.)

**SUKHOMLINOV, VLADIMIR** (1848– ), Russian general and war minister, was born in 1848. He passed through the cavalry school in St. Petersburg, and in 1867 was given a commission in the Guard Ulans. He graduated from the Academy of the General Staff in 1874. He took part in the war with Turkey in 1877–8 as an officer of the general staff and was awarded the St. George Cross of the fourth degree. From 1884 to 1886

he commanded a dragoon regiment and from 1886 to 1897 he was the head of the officers' cavalry school in St. Petersburg, having meantime in 1890 been promoted to the rank of general. His next appointment was as commander of the 10th Cavalry Division. In 1899, while commanding the troops of the Kiev military district, Gen. Dragomirov appointed him as his chief-of-staff and later as his assistant. His close connexion with Gen. Dragomirov, who enjoyed enormous prestige in the Russian army, ensured Sukhomlinov's future career. After the death of Dragomirov, he was appointed commander in Kiev.

From 1909 to 1916 he was Russian war minister, and it was under him that two Russian orders for mobilization were given at the outbreak of the World War. Self-confident and ambitious Sukhomlinov played a disastrous rôle in the administration of the Russian army. Notwithstanding the discovery, even in Oct. 1914, that there was an insufficiency of shells, rifles and cartridges, he assured the Duma that everything was all right. It was only in 1916, under strong pressure of public opinion, that the Tsar Nicholas II. dismissed him from office. Finally he was brought up for trial on a charge of treason. The court found him guilty of offences in office, and he was sentenced to penal servitude. Later Sukhomlinov was freed by an amnesty granted by the Bolsheviks and went to Finland. In 1921 he began the publication of his memoirs. (N. N. G.)

**SUN YAT-SEN** (1867- ), Chinese leader of the revolutionary movement which ended in the abdication of the Manchu dynasty in Feb. 1912, was born in Kuangtung province, the son of a native Christian. He studied at the College of Medicine in Hong-Kong from 1887 to 1892, and there took his degree in medicine and surgery. He practised his profession first at Macao and then at Canton, but from the outset of his career displayed more interest in politics than in medicine, being by temperament an iconoclast, an organizer of secret societies and a leader of conspiracies against the established order of things. Inspired by his semi-European training, with bitter resentment against the Manchus, whom he regarded as responsible for China's humiliation at the hands of Japan, he first raised the standard of rebellion and of Cantonese independence in 1895; but the *coup* failed and Dr. Sun was compelled to seek safety in exile. Henceforward all his energies were directed towards stimulating the anti-dynastic movement, first by the collection of funds from the Chinese communities in the United States, Hawaii and the Straits Settlements, and then by organized propaganda work conducted by secret agents throughout the Empire. He received considerable assistance and encouragement in Japan, where he founded a society known as the Tung Men-hui, which played a prominent part in Chinese politics after the establishment of the Republic. Although an exile, he was generally regarded by the "Western-learning" section of Young China as its leader, especially after the Chinese Government's attempt to kidnap him in London, in 1896. In 1911, when the revolution broke out prematurely at Wuchang, Dr. Sun was in England; but he hurried back to China and arrived at Shanghai on Christmas Eve, in time to be acclaimed as the originator of the Republican programme and elected Provisional President by the delegates to the National Convention assembled at Nanking. On Jan. 5, after having taken the oath of office, he issued a Manifesto (countersigned by Wu Ting-fang as Minister for Foreign Affairs) in which the purposes and policy of the Republican Government were proclaimed. On Feb. 12 an Imperial edict announced the abdication of the Emperor; it surrendered the reins of government to the representatives of the sovereign people and declared that henceforth the constitution should be Republican; at the same time, the organization of the new form of government, was entrusted, "with full powers," to Yuan Shih-k'ai. On the 14th, Sun Yat-sen resigned the Presidency and in the name of the Nanking Assembly invited Yuan to accept the position of Provisional President. His action was applauded by Young China at the time as evidence of patriotic self-abnegation, but events proved that it was chiefly inspired by recognition of the fact that he and the Cantonese group of politicians who had joined him as leaders of the Republican movement, did not

yet carry sufficient weight to justify them in attempting to form a national government.

Relations between Sun Yat-sen and Yuan Shih-k'ai were never cordial, but until the ejection from Peking of the Kuo Min-tang Radicals by the President Dictator in 1913, they preserved the appearance of goodwill, and towards the end of 1912 Sun accepted a highly paid appointment as Director of National Railways at Shanghai. After the failure of the Kuo Min-tang's "war to punish Yuan," Sun wandered again in a wilderness of conspiracies. Eventually, after the death of the Dictator (1916) he became one of the Cantonese group of politicians which waged continual warfare against the party in power at Peking. Because of the futility and sordid intrigues which characterized the independent Military Government at Canton, he, whose reputation in 1912 had stood high at home and abroad, came gradually to be regarded as an irreconcilable conspirator, whose personal ambitions were largely responsible for the continuance of the senseless civil strife between the North and the South. By the vehemence of his rhetoric, by the fervour of his grandiose schemes for the remaking of China at the time of the revolution, he captured the imagination of considerable sections of the public, especially in the United States; but his subsequent career failed to justify his own belief in himself as a heaven-sent reformer. In April 1921, a special session of the Southern (Canton) Parliament elected him to be President of the Chinese Republic, his supporters declaring the Canton "Military Government" to be the only lawfully constituted government in the country; but the influence of these Cantonese "Constitutionalists" over the other southern provinces had then become almost insignificant, and the "Military Government," prohibited by the Foreign Powers from interfering with the revenues of the Maritime Customs, was confronted by financial problems of a kind which threatened not only its reforming activities but its continued existence.

**SUPAN, ALEXANDER GEORG** (1847-1920), Austrian geographer, was born at Innichen, South Tirol, March 3 1847. He was educated at the Laibach gymnasium, and in 1870 took his doctor's degree at Graz, afterwards becoming a teacher in the Oberrealschule at Laibach. In 1872 he left Laibach and studied geography at Vienna, Dresden and Halle, returning in 1877. In 1881 he was appointed professor of geography at the university of Czernowitz, and in 1884 became editor of *Petermanns Mitteilungen*, retaining this post until 1909, when he accepted the chair of geography at Breslau. Under Supan's editorship *Petermanns Mitteilungen* was more concerned with reports and accounts of geographical work in every sphere than with original papers and records of discovery, and a feature in which the editor was much interested was the publication of supplements to the *Mitteilungen*. An account of the economic produce of N. America, 1880-5, appeared in this manner in 1886, and *Die Bevölkerung der Erde*, founded 1872 by Hermann Wagner and Behm, was continued by Supan as a supplement from 1890 to 1910. In 1889 he became editor of the statistical calendar of the *Almanach de Gotha*. His original contributions to geographical science are chiefly concerned with climatology and oceanography, and his published works include *Lehrbuch der Geographie* (1873); *Statistik der unteren Luftströmungen* (1881); *Grundzüge der physischen Erdkunde* (1884); *Deutsche Schulgeographie* (1895; latest ed. 1915) and *Die territorialische Entwicklung der europäischen Kolonien* (1906), besides many papers in *Petermanns Mitteilungen*. He died at Breslau July 6 1920.

**SUPPLY AND TRANSPORT, MILITARY** (see 26.113).—During the World War, the administrative services—i.e. the management of transport, supply, welfare and salvage—became of vastly increasing importance. The struggle was between groups of nations bending to the task of war the whole of the resources of a highly complex scientific civilization, and using in its prosecution every material and moral factor at their command. Some note of the working of the administrative machinery (especially at the culminating point of the struggle) is necessary to give a true picture of the war. Attention will be given here in the main to the British organization in 1918—with illustrative references

to other armies and to prior dates. For the feeding of the British army, see **FOOD SUPPLY**.

When the armies first took the field in 1914, Germany was at a clear advantage in administration. That was to have been expected. It was her war, and she had prepared for it with meticulous care. The equipment of the German soldiers comprised several novel ideas for greater comfort and efficiency. Examining some of the German dead who had fallen in the early reconnaissance affairs in front of Tirmont on Aug. 14, the writer had the first uneasiness that Germany might win, so strong was the evidence their equipment gave of a patient and thoughtful preparation. The impressive sweep of the German host through Belgium showed, too, that the German railway organization was superb, and the way the guns kept up proved that there had been a clear thinking out in advance of the new problems of ammunition-supply which the free use of heavy artillery as field pieces had brought to the fore. German staff documents published since the war by Gen. Ludendorff indicate that these matters of administration had been studied from 1910 onwards and that the German staff were confident that their inferiority in numbers would be compensated by a superior organization in supply. The French administrative services in 1914 appeared much weaker if examination were confined to plans and *matériel*. The troops were not as well provided for, the transport organization not so well planned. But if the human factor were taken into consideration much of the handicap was made up. The French showed a genius for improvisation on the actual battle field, and an astonishing faculty for "getting there" with inferior means. Their food scales for man and beast (to give an example) spelt scarcity in German or in English eyes; but they sufficed. In the battle the French soldier was never inferior in energy and endurance; and the French transport was generally up to time. The national *élan* overcame material deficiencies; and a genius for quick improvisation showed constantly, never more dramatically than in the mobilization of Gen. Gallieni's "Taxi-cab Army" which moved out to the defence of the capital at a critical juncture. The British administrative services in 1914 were lavish both of supplies and transport. But the British force was a small one, and though its scale of transport was extravagant compared with the French, the total was only 250 motor cars, 950 motor lorries and 40,000 horses. With railway transport it then had no concern: the French managed its railway transport. Indeed the British force in France in 1914 did not completely "administer" its own affairs. Though it was a distinct army in command it was dependent on the French organization for essential services of transport.

**The Trench War.**—A long period of trench warfare followed the battle of the Marne, and the administrative systems of the three armies were adapted to new conditions, the chief of which were an enormous increase of ammunition expenditure, the introduction of poison-gas as a weapon, calling for entirely new supplies of offensive and defensive material, and a simplification of the problems of transport, which in a stabilized warfare could follow almost a civilian routine, disturbed only by the chances of shell fire. The trench war was, of course, punctuated by heavy attacks on both sides, but the shift of ground was never great. Administration, whilst it had to cope with the enormous progressive increase in the scale and variety of supplies per division, was thus given ample time as a rule to increase its transport facilities. It could add to its broad-gauge railway tracks, supplement them by light railways and tramways as well as by motor-roads, and develop the canal systems as useful adjuncts.

In this period of trench warfare the Germans suffered from a steady deterioration as compared with the French and the British. The war had become a contest of *matériel* in which Germany could not keep up. The French were able to develop their supply on more generous lines with the help of British and American resources. The British transformed their system completely. The nation took the view that "money was no object" in securing for the troops the best possible chance of victory and the best possible comfort in the trenches. The

growth of supplies (and therefore in transport) was almost incredible. The British force in 1914-5 suffered from a shell and gun shortage as compared with its enemy, because it had been trained and equipped for a different type of warfare. It had very little H.E. shell, and what it had was not really "high explosive" owing to poor fuzes. The patient search for a "fool-proof" fuze had been so successful that what little H.E. shell they had spluttered off rather than shattered off. The production of high explosive in 1914 was almost negligible. The whole year's supply would not keep the guns of 1918 going for a day. In 1915 Britain began to produce high explosive on a large scale. In 1916 she had increased the 1915 amount sevenfold. In 1917 she had increased that 1916 amount fourfold. From March 1915 to March 1917 the increase was twenty-eight fold. With the increase in the production of high explosive went a corresponding increase in big guns and in field pieces. The expenditure of ammunition in time reached to huge figures. The following are the biggest day records in tons:—July 1 1916 (Somme) 12,776; April 9 1917 (Vimy) 24,706; June 3 1917 (Arras) 17,162; June 7 1917 (Messines) 20,638; July 31 1917 (Ypres) 22,193; Sept. 20 and 21 1917 (Polygon Wood) 42,156; Aug. 8 and 9 1918 (general attack) 15,598 and 23,706. Ordinarily the British depots in France kept a reserve of 258,000 tons of ammunition, and the issues in a normal month ran to about that figure, though it varied a good deal month by month. Thus the average daily expenditure during the last months of 1918 was:—May, 5,478 tons; June, 4,748 tons; July, 5,683 tons; Aug., 9,046 tons; Sept., 8,576 tons; Oct., 4,748 tons; Nov., 3,158 tons. (See also **MUNITIONS**.)

**Gas Warfare.**—The introduction of poison-gas was, after the growth of ammunition expenditure, the chief factor in the increase of supply. It was constantly presenting new problems for the administrative services. At first British and French work was solely defensive—the provision of masks, the wearing of which would give immunity, the detection of new gases so as to provide new means of defence. But in time the Allies took the gas offensive, and then their gases were more potent and more plentiful than the enemy's, and for lack of material he could not give his men perfect gas protectors. The last form of gas warfare was the introduction of mustard-gas, a powerful corrosive discharged from shells, which infected the ground on which it fell for many hours. The use of mustard-gas by the enemy raised many problems of supply. The disinfection of contaminated ground with chloride of lime, a prompt change of clothing and bath treatment for men affected, proved efficacious in dealing with mustard-gas. There was, too, safety in protective overalls of oilskin. Mustard-gas affected the veterinary service heavily, there being many casualties to horses and mules through passing over ground infected with the gas.

Big-gun ammunition and gas-warfare munitions were, however, only two items of supply. Rifle and machine-gun ammunition, food for man and beast, trench stores, engineering stores, were other items, all of which had a tendency to grow. In the total during a spell of intense fighting, the British administrative services would carry up to the battle-line 1,934 tons of supplies of all kinds per day per mile of front. The intense battle-front might stretch over 10 miles or more, calling for some 20,000 tons of munitions, food and equipment per day for that 10 miles, much of it passing through furious shell fire before reaching its objective.

The French administrative services never reached the same scale of supply as the British. They expended less ammunition, issued a ration of less weight to man and beast, and dispensed with much of the "comforts" equipment of the British force. But in facing such a German effort as the Verdun attacks of 1916 they had a tremendous problem of transport, which was met by a motor lorry mobilization, the success of which was one of the great feats of the war.

**British System Reorganized.**—From 1914 up to the date of the first battle of the Somme (July 1916) the British administrative services had had no very severe test (unless the battle of Loos could be so counted, and the organization then was not good).

But by the middle of 1916 the British force in France considered itself completely organized. In munitions it was better supplied than any other force in the field. It had taken over control of its own railway services, supplementing the French broad-gauge railway system, which it had taken over and increased, it had a system of light railways and a greatly increased scale of motor transport. But the Somme battle showed many serious weaknesses. Supply had been increased beyond the scale that transport could cope with. There followed in Nov. 1916 a reorganization of the system. One feature of this organization was good. The division of authority, which put the administrative services under two heads, one for the battle area and one for lines of communication, was done away with. The military railways, which had been hitherto starved, were reorganized, and were generously supplied with staff and material. But what proved in the result to be a mistake in organization was made: railways were separated from the control of the quartermaster-general (who kept control of other forms of transport), and put under an independent directorate of transportation. Thus the commander-in-chief had two separate transport authorities to deal with.

There followed after the battle of the Somme a period when the line was practically stable for a long period; and whilst the almost stationary trench warfare continued, the weakness of this division of authority, and the mistake of allowing any but the military idea to rule in an essential part of the army organization, were not apparent. When the Germans attacked in the spring of 1918 those errors showed very clearly, and the railways had to be brought again under the control of the quartermaster-general, after an interval during which they were under a committee of the staff. But the transport situation then was very critical. The German advance had brought the British front lateral line—St. Just—Amiens—St. Pol—Hazebrouck—under shell-fire at many points. The Germans, whose strategy under Gen. Ludendorff was dominated largely by transport considerations, sought to paralyze completely the whole railway system by continuous air-attack on the British rear lateral—Eu—Abbeville—Étaples,—especially at the points where it crossed the rivers Canche and Somme. Whole-hearted work in building "avoiding" lines and bridges, and the efforts of the motor transport, just kept the position in hand until a British advance in front of Amiens relieved the front lateral. It was a happy circumstance that a new quartermaster-general of the British army in France, Lt.-Gen. Sir Travers Clarke, had just brought to completion the building up of a G.H.Q. reserve of motor lorries. He thought in the winter of 1917-8 that the battle of Passchendaele had exposed a weakness in light railways—that they had to work along defined tracks which could be intensively shelled by the enemy. The British army therefore decided to trust more to the motor transport. There was effected a complete reorganization of it, with the central idea of doing away as far as possible with the "earmarking" of motor vehicles for particular units or particular tasks, and making its total strength completely mobile and liquid. Vehicles saved by this "pooling" were formed into a G.H.Q. Motor Reserve. This proved of great strategical benefit in the spring of 1918. The G.H.Q. Motor Reserve was able then to take up part of the traffic load, and was largely responsible for saving the situation. There were lorry drivers who held the wheel for 36 hours at a stretch, and were lifted from their seats fainting or asleep; a few—who carried on until no longer able to see through their bloodshot eyes—ran their cars into trees or walls or ditches. There were many casualties, but the situation was saved at a time when the railways could not meet the work of supply.

Passchendaele, terrible ordeal as it was for the British army, gave valuable hints as to the proper place of light railways in an administrative system. Light railways at one stage of the war were perhaps over-estimated. There was an inclination to regard them as all-sufficing. The British administrative services ultimately gave them their proper rôle, recognizing that they were most valuable when the line of battle was stabilized for some length of time, but tended to be less valuable as the war

became one of movement. In the spring of 1918, the British army had 920 m. of light railways in operation; in the summer 100 m. less. Its great advance was planned on the principle of concentrating labour upon pushing forward the broad-gauge railways and the roads forward from them, trusting to motor transport and to horse transport to carry on the load from broad-gauge railroad. Earlier in 1918 controversy on the subject was keen, and the French were inclined to take a differing view. The Germans, of course, were tied to light railways, for they had not the means to extend their motor traction. The position on Nov. 11 1918 seemed to justify the British view.

By the summer of 1918 the British administrative services were so confident of their machine that they were supporting strongly in favour of trying for a "knock-out blow" as against the alternative plan of devoting the winter to final preparation for an overwhelming campaign in the spring of 1919. "Administration" covered at this stage a wide scope. It arranged the supply, from England, and from its own workshops and local civilian workshops, of all the varied equipment of the forces, from a tank and a 15-in. howitzer to a tin of dubbin. There came to the ports of France every month for the B.E.F. about 800,000 tons of material. The men to be fed totalled over 2,000,000 and the animals about 500,000. The transport system in addition to half-a-million horses and mules, had about 20,000 motor lorries running over 9,000,000 motor miles per month; it carried on its light railways about 544,000 tons a month, and ran every day 250 trains on its broad-gauge lines. It was constantly building new railways and new roads, and developing new harbour facilities. It ran canal and sea barge services, forestry and agricultural services, and repair shops, on a gigantic scale. It supplied the medical stores for wounded and sick, the veterinary services, the laboratories for the defence of men and animals against poison-gas and for the gas counter-offensive. In the last year of the war it produced timber from French forests for four-fifths of its total needs. It grew vegetables and other food and fodder stuffs, and helped as tiller and harvester in the French fields (in 1918 it saved the crops on 18,000 acres, harvesting at night, the soldiers having to work sometimes in gas masks). It was its tailor, bootmaker, laundryman and even ragpicker. The soldier on going out of the line had clean underwear waiting for him at his divisional baths; his soiled garments were disinfected, cleaned and repaired for reissue; his socks darned, buttons replaced, rents patched; and the garment beyond repair was shipped away as rags for the shoddy mills of Dewsbury.

This administrative army was caterer for men and horses. The civilian world throughout Europe might be suffering from scarcity of food supplies, but to the very last the British soldiers and horses enjoyed good rations. This was only made possible by an organization that eliminated every form of waste.

As banker this administration dealt with every currency and note-issue of the world. It had savings banks and an investment organization for British troops, and even special savings banks for the Chinese. It insured its civilian labourers against death and accident; it negotiated the payment of *coltoi* to towns where its troops were stationed, and paid compensation of French property owners for the leases of their lands and buildings and the war damage to their property.

*The Complexity of Administration.*—This wide range of activities, though it had to be carried on under conditions which varied from day to day, fell with minor variations into three main categories. (1) *Maintaining a stabilized position.* This was comparatively easy. The traffic demand was known. Wastage of horses and material could be calculated with some certainty and replaced by a routine process. (2) *Preparing a big attack.* This made the greatest strain on transport and supply, and the necessary conditions of secrecy added complications. In preparing an offensive the traffic tonnage more than doubled per division. This was due to the necessity for making new railways and new roads, and the accumulation of defence material to fortify a new line. But the accumulation of ammunition was also a factor. On a quiet sector two divisions could be

served by three trains daily. For the preparation of a big attack ten divisions might be concentrated on that sector, and those divisions in the preparatory stage of the attack would need about 33 supply trains a day, and during the offensive about 27 trains a day. And these trains would carry material only to broad-gauge railroad. After that most of it had to go farther forward by light railway, motor and horse traffic, and in some cases even by the "Yukon pack," i.e. by man portage. (3) *Resisting a big attack.* The difficult element here was its unexpectedness. The amount of supplies per division necessary to go up from base would be 25% less than in the case of the preparation of a big offensive. There was always carried a good reserve of ammunition, food and engineering stores, close behind the line, and a further reserve of ammunition already loaded on trains at appropriate railway centres. In case of emergency, ammunition could start to move up as soon as a locomotive could be coupled to a standing train. The German offensive in 1918 showed that the British carried near the front line too great reserves, and there were unnecessary losses in food, stores and ammunition, as a consequence. Forward "dumps" were thereafter reduced.

The organization at the front in 1918 to cope with this work in the British army, had at its head the quartermaster-general (Lt.-Gen. Sir Travers Clarke) and two deputy quartermaster-generals (Maj.-Gen. Ford and Maj.-Gen. May). The headquarters staff consisted of about 40 officers, and the detailed work was divided under the following departments:—Director of Agricultural Production (Brig.-Gen. Earl of Radnor); Director of Army Postal Services (Brig.-Gen. Price); Deputy Controller of Canteens (Col. E. Benson); Director of Engineering Stores (Brig.-Gen. Sewell); Director of Forestry (Brig.-Gen. Lord Lovat); Director of Hirings and Requisitions and President of Claims Commission (Maj.-Gen. L. B. Friend); Controller of Labour (Brig.-Gen. Wace); Director of Ordnance Services (Maj.-Gen. Sir C. M. Mathew); Paymaster-in-chief (Maj.-Gen. Sir C. A. Bray); Director of Remounts (Brig.-Gen. Sir F. S. Garrett); Controller of Salvage (Brig.-Gen. Alexander Gibb); Director of Supplies (Maj.-Gen. Carter); Director of Motor Transport (Maj.-Gen. Boyce); Director-General of Transportation (Maj.-Gen. Crookshank); Director of Veterinary Services (Maj.-Gen. Moore); Vice-Chairman Imperial War Graves Commission (Maj.-Gen. Fabian Ware); Director of Works (Maj.-Gen. Sir A. M. Stuart). Subsidiary directorates under the Director-General of Transportation were:—Director of Construction (Brig.-Gen. Stewart); Director of Docks (Brig.-Gen. Wedgewood); Director of Inland Water Transport (Brig.-Gen. Luck); Director of Light Railways (Brig.-Gen. Harrison); Railway Traffic (Brig.-Gen. Murray); Roads (Brig.-Gen. Maybury).

A comparison of this organization with the French administrative services would suggest that the British was over-elaborate. But consideration must be given to these important facts: that the British army was operating in a foreign country, and moreover in the country of an Ally where there must be the least possible friction with the inhabitants; that by custom both men and animals in the British force required a particularly generous ration; that the British force expended far more ammunition than the French, and in its campaign methods kept up a permanent minor offensive even on quiet sectors, as was not the custom with the French. When in the course of the operations early in 1918, French and British troops were intermixed in the battle line, it was found by experience impracticable to supply British units through the French system, and, except as regards such items as hay and petrol, which were kept in a common pool, the supply and transport had to be duplicated, a British system being set up side by side with a French.

*Salvage.*—An account of the administrative system in the World War would be incomplete without some reference to the salvage activities of 1917-8. The submarine war began to have its cumulative effect just when there came the most peremptory reminders that supply was going to be the determining factor of the final struggle. Munitions, food, equipment, railways, roads, ships—these had become the most important factors, and victory would incline to the force which could best concentrate the means to maintain an

overwhelming force at some particular point, and could best develop, conserve, and transport its material. From 1915 to the middle of 1917 it was only necessary for the British army to ask and it received. Later in 1917, and in 1918, there came requisitions which could not be met. Just before the German attack in 1918 (to give one example) there were desperate calls for barbed wire, to make up an actual shortage of 8,000 tons in the minimum requirements for safety; but it was not available. In food, forage, clothing, timber, metals, the world-shortage had now become acute. The administrative services of all armies sought to better their position, in Europe, by the organization of a department of salvage. As the British salvage department explained, "the shortage of almost every kind of raw material used for war supplies makes salvage an important administrative service. Without a well-organized and thorough salvage system, the full maintenance of our force in the field would be made difficult. . . . The salvage organization is not intended to take the place of, or in any way discourage, a consistent effort on the part of every supply department to recover for repair and re-issue its own articles and its own empties. It is intended to supplement that effort; to collect and put to use what would otherwise become derelict; to insure that nothing utilizable is allowed to go to waste."

There is nothing of the debris of the battlefield which we cannot put to some use." Some of the items of salvage values taken from a monthly return show the wide range of the department—swill for piggeries, £600; solder from old tins, £300; cotton waste, £500; tin-plate (won by unrolling old biscuit tins, etc.), £2,500; old lead, £400; various by-products £200,000. The old rags collected did a great deal to help the cloth shortage at home. The old bones collected made glycerine for explosives. In Sept. 1918 the British army saved £4,000,000, and the American army £3,000,000 by salvage.

*The Animals of the Force.*—The administration of the animals of the British force—the largest mobilization of animals known to history—calls for a special note. The worst difficulty in their case was mud. From early in autumn until late in spring the mud season lasted. Off the *postr* roads all the fighting area of Flanders was semi-liquid, and the problem at horse-lines was first to secure a solid "standing," next to secure a solid road in and out to that standing, and finally to secure a solid road to and from a solid watering-place. Standings were usually made of bricks, and the army requisitioned all the brick yards in the occupied area. Shell-ruined villages were another source of brick supply. The bricks had to be set properly; rubble was lost in the soil within a week. Losses from enemy action were not very high among the animals until the last phase. There was little cavalry work except at the end of the campaign and at its very beginning. But horses and mules suffered greatly when the enemy began to use mustard-gas (1917-8). The ground where a mustard-gas shell had fallen was infected for long afterwards. If horses were picketed on it, or even passed over it, casualties were high. The irritant poison of the gas attacked their hoofs and their skins wherever the hair was thin and caused sloughing wounds. An effective curative treatment was found in a dressing, the chief ingredient of which was chloride of lime. From the spring of 1918 the animals suffered severe attacks from the air. The enemy devoted much of his air-force to bombing attacks on horse-lines, with a view to lessening British transport strength. At first these attacks had serious effects. Then horse-lines were camouflaged; the animals were separated into small groups; the lines were protected by bomb-proof traverses of earthwork, which localized the effects of explosions. In the summer of 1918 the wastage of animals by sickness had been cut down to a very low rate (7.7%), as the result of skilful horsemastership. At this time forage difficulties were acute, but there had been close organization for grading fodder in army and line-of-communication areas, and the animals always had sufficient rations. British administration was able to take a considerable part of the burden of horsing the American units which arrived in France in 1918. Nearly 25,000 animals were made available by reductions of the horse-strength of artillery units. A further 14,000 were saved by giving 6-in. howitzer and some 60-pounder batteries mechanical transport. Another means of economy in horse flesh was the setting up of a "category B" for animals which were not quite fit for arduous work with a fighting unit, and were withdrawn to units whose demands on them were less exacting.

*Some Comparisons.*—As between the three administrative machines, the French, the British, and the American in the autumn of 1918, certain points of difference may be noted. Both French and American systems still kept a dividing line as regards administration between the base and the fighting line. The British system had abolished this (together with the post of Inspector-General Lines of Communication) in 1917. The French divided the zone of the armies into the zone of the advance and the zone of supplies (with sometimes an intermediate zone). In the zone of their advance administration was in charge of the *Aide-major-général chargé de la direction de l'arrière* at G.H.Q. But his administration had no functions of procurement, only of distribution. In some points of administra-

tion the dividing line between the zone of advance and the zone of supplies was abolished; e.g. all motor transport and all light railways, wherever operating, were under a D.A. at G.H.Q. The French system of supply and distribution was fashioned for war in the home-country or near to it, when it was transplanted (for instance, to Salonika) it had to be modified somewhat on the lines of the British system. The American system put administration in the fighting line under an assistant chief-of-staff (G.4) at G.H.Q.; and on the lines of communication under a general commanding S.O.S. (corresponding to the former British I.G.C.). Under the American system the chiefs of the supply services were not at G.H.Q. but at the H.Q. of S.O.S. With both the French and the American systems evacuation and hospitalization of casualties were purely "Q" services: in the British army they were under the adjutant-general assisted by the quartermaster-general. Some other differences came from geographical reasons. France itself was really the supply-base for the Americans, whereas the British had the United Kingdom for this purpose; so the Americans held great stocks in depots—15 days of supplies in advance depots, 30 days supplies in intermediate depots, 45 days supplies in base depots. The American army naturally relied more largely on local purchases (from the Allied armies and from European civilian sources) than did the armies with their home bases nearer at hand. General Pershing founded a general purchasing agency to control these purchases. In 1918, out of 17,600,000 shipments used by the American army only 7,600,000 tons came from the United States and 10,000,000 tons were purchased locally, and to the end of the campaign the American army drew largely upon British and French supplies.

The British administrative machine in one particular point was inferior to the American machine in 1918. Under the British system the navy had control of all supplies by ship until they left the transport. The navy could put a supply-ship into any port it pleased, and naturally was guided chiefly by shipping considerations. Thus supplies for the southern area might go to a northern port. The American system put the supply ships under army direction when they came within the three-mile coast limit, and they could be directed to the port of supply which was most convenient from the army point of view. The French and the Americans used the railway regulating stations as depots; the British used them as sorting stations only. The British used the base-ports for sorting goods to a great extent; the Americans did not. In the autumn of 1918 the Americans found their one great depot, and sorting and regulating station, at Is-sur-Tille insufficient for the needs of their growing army, and they were proceeding with the organization of another station when the Armistice came.

The general staffs of the various combatant nations were in 1921 still working out the lessons of administration as taught by the World War. One principle seems to be generally accepted, that it is wise to centralize as far as possible all administration under one staff officer over the whole war area, trusting to him to devolve and coordinate. That was the final principle of the organization of the administrative services in the British army in 1918. In the first phase of the war the French organization did a large portion of the work of transporting the British army and its supplies. As the British force grew in strength, and the problem of its administration grew in complexity, the experiment was tried of dividing responsibility between the quartermaster-general of the force and the G.O.C. lines of communication. "Q" tasks were under different control in battle areas and at the base. This did not work satisfactorily, and the next experiment was to divide responsibility between the quartermaster-general and the director-general of transportation (the latter having control of the broad-gauge railways, the former of all other transport). This arrangement broke down in the spring of 1918, when the British army was put into serious jeopardy through the transport situation; retirement south of the Somme had to be contemplated, at one stage as probable, and the details were actually arranged for the destruction of the ports of the Pas-de-Calais so as to deny their use to the Germans. In the

summer of 1918 the British administrative services from the coast line to the trench-line were put under one head, the quartermaster-general, for experience suggested that the commander-in-chief should have one man to whom he could confide the responsibility of the administrative side of his army's operations: to divide the responsibility was not to simplify but to complicate the task. (F. F.)

**SURVEYING** (see 26.142\*).—The most striking feature to be recorded in connexion with surveying generally is the greatly increased importance which it acquired during 1910–20 from a military standpoint. This was chiefly due to the stationary character of the World War on the western front, but other factors contributed, notably the introduction of air-photography. The use of photographs, taken from aeroplanes, to determine the position of enemy trenches and other detail inside the enemy's lines, made a considerable difference in the technique of modern war and reacted upon the methods of peace-time surveys. But not only photographs from the air, but also photographs taken on land have been pressed into the service of surveying, and the applications of photography to surveys of mountainous regions such as the higher Himalayas have been greatly extended.

In exploratory surveying the conditions have been changed and simplified by the introduction of wireless telegraphy, for the determination of longitude; the accurate fixing of his longitude, long the explorer's bugbear, is now no more difficult than taking a latitude. In the more regular branches of the subject the principal matter demanding attention is the development (in which many countries have taken part) of accurate methods of levelling, particularly of precise or geodetic levelling.

#### *Surveying in War*

Geographical and topographical surveys are well known adjuncts to military operations. The war of 1914–8 showed that all other classes of land surveying, i.e. geodetic triangulation, levelling, and large scale surveying may be called upon to assist in the development of scientific and mechanical warfare. It is not possible to forecast whether future developments may demand an enhanced accuracy of survey, or whether the increasing importance of aviation, amongst other factors, may not prevent a recurrence of the stationary operations which prevailed over the western front for four years. A description of the more important duties of the Survey battalions on the western front, offers the best record of an intensive large scale military survey.

*The Trigonometrical Control.*—The extent of the line, liable to periods of intense activity throughout its length, and the constant changes of army and corps fronts made it necessary to provide a homogeneous and complete system of triangulation upon which to base the maps and the local surveys called for.

Five separate and distinct triangulations already covered this area before the outbreak of war, viz:—

1. The French main arcs and subsidiary triangulations of 1890–50.
2. The new French Paris meridian and Amiens parallel and their subsidiary orders of 1890–1900.
3. The French Admiralty coastal triangulation.
4. The Belgian national triangulation.
5. The German national triangulation.

All these triangulations were eventually combined into a single coherent system, but not until just before the Armistice and too late to assist in operations. The surveyors of the various armies kept in the closest touch with each other, but discrepancies arose nevertheless, and time was wasted in fresh observations and recomputation. It was realized somewhat late that the adjustment of the discrepancies of local triangulations is the best preliminary to military surveys.

Many of the stations of the triangulations enumerated had been destroyed or built over before the war and many were destroyed during its progress. Numbers of new stations had, therefore, to be established and the trigonometrical observer was employed in intersection and interpolation, rather than new triangulations.

This patched and reconstructed triangulation stood then as a basis for all the military surveys of the western front.

*Provision and Issue of Maps.*—The British Expeditionary Force took the field equipped with the 1/80,000 *carte de l'état major* of France and the British 1/100,000 maps of Belgium. Topographical maps of this sort were accurate enough for mobile operations in which no heavy guns were employed. Directly the operations tended to become stationary first on the Aisne, and then in Flanders, staff, gunners, and infantrymen demanded a map of such accuracy and

\* These figures indicate the volume and page number of the previous article.

scale that administrative arrangements, lines of fire, and trench systems could be shown upon it. Such a map did not exist except in the Belgian area, and elsewhere had to be made. The earlier war surveys were made upon the plane table on a scale of 1/20,000 and were completed up to the British trench lines. The subsequent development of air-photography, and the discovery of the manuscript sheets of the cadastral communal surveys, made it possible to compile reliable maps, not only of territory in British occupation, but of all that portion of north-eastern France occupied by the German armies.

The trench zone was mapped on a scale of 1/10,000, and forward and back maps at 1/20,000. In all 6,000 sq. m. were surveyed.

A reliable map of the physical and artificial features of the country is not sufficient in itself. The positions of defensive works of the enemy batteries, of the points of administrative importance, and of many other objects must be shown on frequently recurring editions. From 12 to 20 editions embodying such information on various scales were kept up for the actual area of operations, whilst during the progress of a battle daily editions were brought out.

To cope with this volume of printing it was found necessary to provide for the rapid reproduction of trench maps at the Ordnance Survey Office at Southampton and for small but complete lithographic establishments in each army and at G.H.Q. Zinc plates were prepared by the Vandyke process or by helio-zincography, and flatbed printing machines, preferably motor-driven, were used for printing in the field. The French and German armies had well-equipped printing trains which were used for increasing printing facilities in important areas. The French, for example, dispatched a printing train to Italy in 1917. Towards the end the Americans employed a well-designed printing plant in lorries.

A scale of issue of about two copies per officer engaged, of each important map, was maintained, but experience showed that this scale should be increased. During the whole period of operations about 34,000,000 maps were printed for issue to the British troops, of which about two-thirds were printed by the Ordnance Survey in England and a third in France.

For the use of large scale maps in trench warfare a well-thought-out system of coordinates, based on a suitable projection, was needed.

It must be possible to read off at sight the coordinates of any desired point from a "grid" or network of lines printed on the map. All the armies had such systems. Experience proved that for ease and accuracy of reference the "grid" should be in squares, the sides of which can be divided decimally by eye. The artillery often desire coordinates of the same accuracy as the surveyor—i.e. on the scale of nature. The system adopted should therefore be based upon the coordinates used by the surveyor, with an easy form of abbreviation to be used by all arms to define map positions. Accuracy of bearing from any one position must be maintained together with as near an approach to linear accuracy as possible, whilst the system must allow of extension over the whole area of operations.

The considerations which influence the choice of a reference "grid" have already pointed to the desirability of an orthomorphic projection. For the conduct of surveys constantly in progress it is equally important. Computations must be cut down to the minimum, and this is best secured by working on a projection in which the position on the ground and the position on the map can be calculated in one process without sensible error.

From the cartographic point of view the question is not so important, and there are many projections which would provide a sensibly accurate map over large areas.

It was decided late in the war to adopt an orthomorphic projection with two standard parallels which had recently been adopted in the French armies, but the decision came too late, and the Bonne projection continued in use in the British army until the Armistice.

**Surveys for Artillery Purposes.**—Other things being equal, that artillery will dominate its adversary which has the quickest and most accurate knowledge of hostile battery positions and which can open most quickly an accurate and unexpected fire upon them. The construction and calibration of guns and howitzers, the homogeneity of ammunition, and the measurement of those atmospheric elements which affect ballistics are involved; but accurate survey of the relative positions of gun and target is essential.

The positions of British heavy batteries were, therefore, fixed with a theodolite, each battery was supplied with a chart or "artillery board" on which the map was pasted down, in sections, upon a zinc or three-ply wood surface, and special "bearing pickets" were inserted in numbers in the battery zone. The bearings from these pickets to surrounding objects, suitable as reference objects, were tabulated and distributed.

The positions of hostile batteries were also surveyed with as much dispatch and accuracy as possible by one or other or both of the following methods:—

(a) Intersection of three or more rays observed upon the flash of discharge, the reflection in the sky of this flash, or, upon the smoke puff from the muzzle. This operation, commonly known as flash spotting, was carried out by units, each of which manned four survey observation posts, or instrument stations, and one headquarter post. Each section had its own internal telephone system and was in direct communication with an artillery headquarters.

Observations were directed by an ingenious controlling exchange upon hostile guns in succession. This method, independent of the

map, gave very good results but depended for success upon good visibility. Flash-spotting units could survey the positions of the bursts of our own shell and were, therefore, also used extensively for ranging and for calibration.

(b) **Sound-ranging.**—A sound, in still uniform air, spreads outwards from its origin with an equal velocity in all directions, and the sound waves may therefore be likened to the ripples spreading outwards on a pond from the point at which a stone has fallen into it.

If we now imagine a row of surveyed pegs, more or less tangential to a ripple, projecting from the surface of the water, if we measure the times at which the ripple strikes each peg and know the velocity of the advance of the ripple we shall have all the data necessary for fixing the position of the origin of the disturbance. All armies engaged on the western front had some system for determining the position of a gun from the sound of its discharge, embodying the above principle. It is unnecessary here to describe the British system, except in so far as the survey of the sound-receiving stations is concerned. A sound-ranging base was generally, though not invariably, laid out on the arc of a circle, the centre of which lay in the zone of the enemy's heavy artillery. There were usually six sound-receiving stations about 1,000 metres apart. The coordinates of the selected spot for each station were computed in the office, and the surveyor had to find and mark the corresponding points on the ground. Errors of more than one metre in position resulted in sensible errors in sound-ranging.

Sound-ranging is naturally unaffected by bad visibility, but is put out of action by a moderate wind blowing from base to gun and is interfered with by any high wind. As in the case of flash spotting, a good telephone connexion to the artillery headquarters is essential.

### Surveying by Air-photography

Air-photography, or, to be more precise, photography of the ground from the air, has been recognized as a possible method of survey since the middle of the 19th century.

Experiments in photographing the ground from balloons had been made by Col. Laussedat, Major Elsdale and others from 1859 onwards, but air-photographs played no part in any important survey before the outbreak of war in 1914. During the course of the war the difficulty of producing maps on medium scales was enhanced by the inaccessibility of the most important areas. It was due to this fact, and to the development in 1915 of photography from aeroplanes, that large areas in many theatres of war were mapped by the aid of air-photographs. But no full examination of the possibilities was made, and for peace surveys the method still remains in the experimental stage.

**Optical Principles.**—Provided that the optical axis of the camera is vertical at the moment of exposure, the resulting photograph of a flat level area will be an accurate plan at a scale determined by the equation

$$\frac{f}{h} = s$$

where  $f$  is the focal length,  $h$  is the height of the camera above the ground at the moment of exposure,  $s$  is the representative fraction of the scale.

Such photographs will be called vertical photographs. As a rule, however, the photograph is not exactly vertical, but the axis is tilted at an angle to the vertical. The photograph then becomes an inclined perspective view. (See Fig. 1.)

FIG. 1.

If the direction and magnitude of the tilt of the axis were recorded at the moment of exposure it is obvious that the photograph could be projected optically or photographically on to the plane of the map, although it would remain unfixd in position and orientation. If the direction and magnitude of tilt are unknown then the projection on to the required plane, or "rectification," is secured by comparing the relative positions of four surveyed points on the

ground and on the photograph, which is then also fixed in position and orientation. Where the tilt is known, approximately three points common to map and photograph will furnish a solution. Two further points of importance are that (1) straight lines upon a plane remain straight lines upon any perspective view of that plane; (2) at any point on an inclined perspective view the scale is not the same in directions parallel to and perpendicular to the axis of tilt.

In plotting detail from vertical photographs certain errors, due to instrumental imperfections, may arise but are seldom of sensible magnitude. These are due to (1) a change in the relative position of plate lens and area photographed, due to the shutter moving so comparatively slowly that the movement of the aeroplane becomes noticeable on the plate, (2) distortion due to optical imperfections of the lens.

**Construction of the Map.**—In order to explain how a map is built up, wholly or partly, from air-photographs it is advisable to take some illustrative cases. The simplest case is where it is desired to produce a map of an area in which a sufficient trigonometrical control already exists and of which there is available a complete collection of cadastral plans, which are, however, much out of date. Ground features are low and gently undulating, extreme difference of altitudes being two or three hundred feet only.

In such a case topography can be brought up to date from air-photographs taken with the axis as nearly vertical as possible, and fitted upon the cadastral framework by one or other of the methods described below. When this is complete the map is contoured in the field, names are added and the topography examined for omissions or mistakes.

The most difficult case arises when the area to be mapped is rugged and mountainous, and the inhabitants hostile: the positions and heights of a few peaks in it, visible from accessible ground, have been fixed trigonometrically, but no reliable map exists.

As a preliminary measure oblique photographs are taken from a variety of points of view. The positions of the camera in space are calculated, and from measurements on each photograph a number of rays are drawn to noteworthy points in the valleys and on the hills. Positions and heights are thus determined for a subsidiary control. With the axis vertical a series of photographs of valleys and of watersheds are taken, pasted together, and fitted to the control. When the map has been thus built up, form-lines are added from the oblique photographs and upon the fixed heights. In the majority of surveys difficulties will be of an order intermediate between those of the foregoing two cases.

**Applications of Air-photography.**—In any particular survey air-photographs may be used then for any or all of the following processes, viz., (1) Air-photo control, (2) Air-photo-topography, (3) Air-photo contouring.

In taking vertical photographs for air-photo control, exposures are so regulated as to ensure a substantial overlap, generally amounting to 50% at least. Each successive photograph may therefore be fitted to its predecessor, and lines or traverses of photographs may be mounted and scaled between fixed points. Any two or more traverses of different and independent lines may be made to intersect over some topographical object, the position of which may be determined as the simple, or weighted, mean of the individual positions from each traverse. Traverses may also be made to converge and end upon some prearranged and hitherto unfixed object. This method has given fairly accurate results in flat country on the scale of 1/40,000, and is dependent upon the ability of the pilot to maintain an even keel and a constant height.

In broken and hilly country no method can be regarded as trustworthy which does not take into account differences of altitude. We must then be content to limit the use of each photograph to the measurement of horizontal and vertical angles and to fix the positions of new points by intersection from two or more photographs. Where this principle is decided upon there remains no advantage to be derived from the vertical photograph, and oblique photographs are used in preference as covering larger areas and allowing greater refinement in the measurement of vertical angles.

The first stage of this photo-topography from the air is to interpolate the position of exposure in space from three or more points, the positions of which on the earth's surface are known, and which appear on the photograph. If we consider the pyramids whose apices are the lens and the bases of which are the triangles formed by the three fixed points respectively on the ground and on the photographic plate (see fig. 2), we see that (a) the angles at the apex are a function of the lengths  $ab$ ,  $ac$ ,  $bc$  (which can be measured upon the plate), and of the focal length, (b) the inclination of the ground pyramid to its base is determined by the direction and magnitude of tilt; at the present time there are no means of measuring accurately the tilt of the plate at the moment of exposure, and calculation follows by successive approximations from a preliminary estimation; (c) the position of  $O$  in space can be calculated and plotted in its correct projection on the plane of  $A, D, C$ ; (d) angles may be measured upon the plate and rays drawn to additional points from  $O$ .

From the nature of the case air-photo control must be limited to the provision of a few supplementary points.

Where the area to be mapped contains a sufficiently close control the filling in of topographical detail is more easily done from vertical than from oblique photographs, providing that the area in question

is not markedly hilly. The scale on which photographs are taken, may be larger or smaller than that of the map, but it must be sufficiently large to allow of clear identification of detail.

The area to be mapped is photographed from a prearranged height in strips allowing for an overlap in all directions. Much depends upon the training of the pilot in maintaining his height and his overlap. It is usual to arrange for a mechanical control of exposures regulated according to the ground speed of the aeroplane.

FIG. 2.

The plotting of detail from these photographs would be simple if the axis of the camera could be maintained in a vertical position. It would then be necessary only to bring the photograph to the scale of the map. No means of ensuring this verticality has, as yet, been evolved. It often becomes necessary, therefore, to fit photographs individually upon the control points. This can be done graphically, or optically by the *camera lucida*, or by the enlarging camera.

The graphic method depends upon the principle that as straight lines on one plane remain straight lines on any perspective of that plane the position of a point which lies upon the intersection of two lines common to the ground and to the photograph may be readily determined. Within narrow limits the proportional compass set to the difference of scale between map and photograph at this point may be used to fix additional points. It is more accurate, however, to maintain the straight line principle and to cover the map and photograph with a "grid" of corresponding lines, as in fig. 3.

FIG. 3.

The photograph is mounted on a sheet of paper— $a, b, c, d$  and  $A, B, C, D$  are four points the positions of which are known and are also identifiable on the photograph. Subsidiary common points at  $o$  are established by drawing the diagonals, and four subsidiary quadrilaterals may then be formed by drawing lines through  $o$  from  $v$  and  $w$ —the intersections of the prolonged sides of the quadrilaterals. The same principle may be applied to any polygons formed by joining up any number of points (more than four) which are fixed on the ground and identifiable on the photograph. Detail may be sketched in by eye.

A useful method of plotting, known as the four-point method, is as follows (fig. 4). It can be proved that the cross ratios of four points which lie upon a straight line are the same upon any perspective view of that line, hence we can readily plot the position of a fifth point ( $S$ ) if we know the positions of four points  $A, B, C, D$ .

Let  $A, B, C, D$  be four known points on the photograph and  $a, b, c, d$  their positions on the map, and let  $S$  be a point on the photograph the position of which on the map is to be found.

Join  $A B, A C, A S$ , and  $A D, a b, a c$ , and  $a d$ .

Lay a piece of paper with a straight edge, in any position cutting the lines  $A B$  in  $B'$ ,  $A C$  in  $C'$ ,  $A S$  in  $S'$  in  $A D$  in  $D'$  and mark these cutting points on the paper.

Now lay the paper strip on the map and fit it upon the lines  $a b$ ,  $a c$ , and  $a d$ , so that  $B'$ ,  $C'$  and  $D'$  lie upon these lines.

Mark on the map the position of a point  $s'$  opposite the mark  $S'$  on the paper strip. Join  $a s'$ . Then  $s$ , the position of point  $S$ , upon the map, lies upon the line  $a s'$ .

FIG. 4.

Repeat this proceeding from  $B$ ,  $C$ , or  $D$ , and another line  $b s'$ ,  $c s'$ , or  $d s'$ , will be secured, the intersection of which with  $a s'$  will define the position of  $S$ .

The camera lucida (see 5.104) has been used extensively for plotting. The upright carrying the prism is mounted on a stand upon which are also mounted two boards roughly at right angles to each other called respectively the map and photograph boards. Movements are added to allow of rotating the photograph in its own plane, of tilting the map (or tracing of control points) around an axis parallel to a marked horizontal line on the photograph board, and of increasing or decreasing the distance between the prism and the photo board (fig. 5).

FIG. 5.

Graphic and optical methods are tedious and lengthy compared with a photographic rectification. The ordinary enlarging camera can be made to answer the purpose with little modification. It must provide, in addition to its focussing movements, as follows:—

1. The negative must be capable of rotation in its own plane around its centre.
2. The copying board and negative carrier must be capable of rotation around parallel axes which are at right angles to the optical axis of the lens.
3. The copying board and negative carrier must be capable of movement along the line axis of the lens.
4. The negative carrier must be capable of a movement bodily at right angles to its axis of rotation.

By means of these movements a coincidence can be obtained between the four control points on the map and on the photograph, and a "rectified" print may be obtained.

Little contouring has as yet been based on air-photographs. It must be recognized at the outset that it is impossible to calculate relative heights from measurements taken from a single photograph; for the accurate determination of relative heights we must have at least two photographs taken from different places. An outline of photogrammetry from the air has already been given and mention has been made of interpolation in space, and of the survey of new points by intersecting rays. A short additional step—the measurement of vertical angles on the plate—makes it possible to calculate the height of these new points.

Stereo-photogrammetry from the air may develop in the future, but has not been made use of hitherto. On the other hand much use has been made of the stereoscopic effect visible on two photographs of the same area taken from different positions. Such information is not of an exact nature but gives a valuable indication of ground forms and brings out the system of drainage.

Until 1920 mapping from air-photographs had been confined almost entirely to war time, and to areas already covered by a trigonometrical control, hence there had been little opportunity of comparing the cost of this method with that of any other, or of laying down definitely its possibilities and limitations. Clearly its greatest value lies in the mapping of inaccessible country.

So far as can be judged, the chief fields of usefulness open to air-photo-topography are, the surveying of native towns on scales of about 1/10,000, or 6 in. to 1 m.; the surveying of deltas and intricate water channels; and the surveying of ancient sites, on which the indications of a former civilization become far more evident in the air than on the ground. Topography on ordinary small scales, and accurate large scale cadastral mapping are, so far, ruled out. But it appears that developments may very well be looked for in each of these directions.

### Photographic Surveying

The idea of applying photography to surveying was originally due to Col. Laussedat (1819–1907), who made some experiments in the matter in 1859, and continued during his long life to expound and develop the method. Although the system originated in France not much was done in that country in the way of its practical application, and, if we except some minor work by MM. J. and H. Vallot in the Mont Blanc region in 1892 and some similar mapping by M. Flusin in 1905, it is to Canada that we must go for its first use on any considerable scale.

In 1895 Mr. E. Deville, surveyor-general of Dominion Lands, published his important work on photographic surveying, which remains a complete exposition of the subject if we exclude some recent departures. Between 1886 and 1892 photographic surveys were confined to the Rocky Mts. in the neighbourhood of the Canadian Pacific railway, but in 1893–4 the method was used by Mr. W. F. King in the survey of the Canada-Alaska frontier. In 1901–2 Mr. A. O. Wheeler carried out a very successful photographic survey of the Selkirk range, British Columbia, on the scale of 1/60,000; this was published, with an interesting account of the range, in 1905.

In the U.S. photo-topographic surveys had been made use of on the International Boundary Survey and reports made by Mr. M. A. Flemer of the U.S. Coast and Geodetic Survey in 1897–8. Stereo-photo surveys (see below) were employed in the survey of Tutuila, Samoa, by the U.S. Hydrographic Office in 1916; and an innovation in the shape of a panoramic camera was first used by Mr. C. W. Wright in Alaska in 1904 and extended by Mr. J. W. Bagley who wrote an important treatise on the subject in 1917 (Washington, Government Printing Office).

In 1907–8 Lt. M. Weiss, of the expedition commanded by Duke Adolphus of Mecklenburg, made a photo-survey of the volcanic Mfumbiro Mts. to the N. of Lake Kivu. Other fragmentary surveys in various parts of the world have been carried out by the aid of photographic methods; most of them, as well as those mentioned above, were in mountainous country.

**Outline of the Method.**—Assuming that a photograph is a true perspective view, that the plate was vertical when exposed, and that the horizon-line and focal length of the lens are known, it is clearly possible to determine the horizontal and vertical angles from the point where the camera was set up to all objects represented in the photograph, the horizontal angles being measured from some known, represented object. If two such photographs are taken from two points, at known distance apart, we have the means of determining the distance and height of all points shown on both photographs.

It will therefore be necessary in planning a photographic survey, to arrange for a triangulation to fix the relative positions of points at which the camera will be set up, and the first stage in the office work will consist in the plotting of the triangulation. A camera

station need not, however, be a trigonometrical point, provided that its trigonometrical position can be measured from the photograph. To use the photographs for plotting the detail, from each camera station A draw, at its correct angle, the central line of view. Along this line draw A x, equal to the focal length of the lens; through x draw a line at right angles to A x and plot from x the projections of the distant points, as measured on the horizon-line of the photograph. The intersection of rays from A to the points so obtained, with rays to the same objects from other stations, will give their positions.

It is an almost universal rule of photographic surveying from the ground to maintain the photographic plate in a vertical position, because any inclination of the perspective plane of the plate adds difficulties to the plotting.

A supplementary order of triangulation is usually added contemporaneously with the field work of photogrammetry, both to fix camera positions and to add a few bearings and vertical angles from which the photographic data may be checked.

For many years cameras specially designed for surveying work have been available, a good example being the Bridges-Lee photo-theodolite. The essential features of these are, that the focal length should remain constant (for which purpose the sensitized surface of the plate should be pressed firmly against the frame of the camera), that the position of the optical centre, and of the horizon and principal planes should be deducible from marks on the plate, and that the lens should be free from distortion and aberration. It is also important to provide levels by means of which to ensure the verticality of the plate. The later photogrammetric cameras are either interchangeable with transit theodolites on the same portable stands, carry eccentric telescopes, or else combine the two instruments by substituting a telescopic lens for the usual photographic lens, and by inserting an eyepiece in the back of the camera. The field work demands a high standard of topographic training, for it is not easy to select the minimum number of views sufficient to cover the country whilst leaving no gaps. Valleys and low-lying areas constitute the main difficulty. One or two stations *per diem* are all that have been occupied by the same party in the photogrammetric surveys of the Canadian N.W. frontier, whilst a supplementary triangulation was carried on concurrently.

The office work takes two or three times as long as the field work and consists in plotting positions, calculating heights, and drawing contours from data measured on the developed plates.

The picture trace will naturally assume the form of the arc of a circle if a panoramic camera is used such as that employed during 1906-6 by Mr. J. W. Bagley in Alaska.

There are several plotting devices on the market, such as the perspective graph, but they have not been largely employed. On the other hand the vanishing scales and perspectometers (grids showing the perspective on a vertical plane of a series of squares on a horizontal and lower plane) can be readily constructed.

**Stereo-photo Surveying.**—The most recent development of photographic surveying consists in the employment of the stereoscopic principle. The stereoscope as a toy has long been known, but Dr. Pulfrich of the firm of Zeiss of Jena, and Col. von Hübl of the Austrian military geographical service, conceived the idea of applying the stereoscopic principle to the service of exact surveying. Other pioneers in 1907-8 were the late Capt. F. V. Thompson, R.E., and Mr. Conrady. In 1913 Mr. G. Müller carried out a successful stereo-photo survey for part of the proposed Hankow-Ichang railway. In order to carry out a normal photographic survey successfully it is necessary to arrange for stations far apart and for intersections of some 30 degrees or so. But in stereo-photo surveying two stations can be occupied on the same hill-top and their distance apart need only be some 50 to 300 feet.

In the simplest case let two vertical photographic plates be exposed from two points, say 100 ft. apart; let the plates be in the same plane and their centres on the same level. Then if these plates are put into a stereoscope provided with a system of lenses and prisms such that the eyepieces are brought to a convenient distance for seeing, we shall clearly get a very much magnified stereoscopic effect as compared with what is obtainable with the naked eyes. In the diaphragm of each eyepiece let there be a similar movable mark, or line on glass. On looking through the eyepieces the marks in question will appear as a single mark floating in space, and by vertical and horizontal adjustments this mark can be made to touch any given object in the picture. We have, thus, a means of measuring small parallaxes and vertical angles, and these can be read off graduated micrometer heads.

A stereo-comparator as above described gives angles from the centre of the plate, distances and vertical angles; but the reading is laborious and the map has to be constructed point by point.

In 1907 Lieut. von Orel, of the Military Geographical Institute of Vienna, attempted the construction of a machine which should quasi-automatically draw the map, and in 1909 such an instrument was made by Zeiss of Jena. A further model of 1911 permitted the automatic drawing of contours and the outline of detail. The instrument is called the stereo-autograph; several have been made and are in existence in Austria, Germany and France. A stereo-autograph is, of course, an expensive instrument and requires a skilled operator and good plates of even density. But, given these conditions, practical results have been obtained and the method is one

to be reckoned with in the future. Generally with stereo-photography we are not limited to a country with marked features, as is the case with normal photo-topography. Provided that the view is clear, gently undulating or flat country can be as well surveyed and contoured as a mountainous region. The method has some obvious applications, but it is useless in forest-clad country or in towns and its value largely depends upon good view points. The old, photographic surveying has as its chief field of usefulness a well-marked mountainous region. The new is not so limited but its rôle has not yet been fully determined.

**Bibliography of Photographic Surveying.**—In 1895 Mr. E. Deville was able to quote the titles of 26 works on photographic surveying; in 1911 Dr. Pulfrich in his *Stereoskopisches Sehen und Messen* mentions 276 works, chiefly in German, on stereo-photography alone! The following books may be recommended: *Photographic Surveying*, E. Deville, Ottawa, 1895; *Hints to Travellers*, vol. 1. R.G.S., 1906; *The Use of the Panoramic Camera in Topographic Surveying*, James W. Bagley, Washington, 1917; *Revue Générale des Sciences*, March 1914, Paris, for stereo-photo-topography.

#### Longitude by Wireless Telegraphy

The chief technical difficulty which explorers and surveyors in new countries have hitherto experienced has been in the determination of longitude in regions unprovided with a telegraph system. This applies to almost all the unexplored, or little explored, parts of the world. Since 1910, however, the great advance made in the transmission of signals by wireless telegraphy has completely done away with this source of difficulty and error. Wireless "receiving" sets are now made of a very portable character; so much so, that one mule or one porter can carry the whole apparatus. Frequent practical use is being made of this method of obtaining time signals, as the following instances will show. In the year 1912 Comm. Edwards fixed positions during the Bolivia-Brazil boundary commission by wireless signals from Washington and intermediate stations; in 1913-4 Cav. Dr. Filippo de Filippi in an expedition to the Karakoram used wireless signals from Lahore and from Italy; Major A. J. Woodroffe in 1913-5 determined longitudes on the Peru-Brazil boundary commission by wireless signals sent from Senna Madureira, Brazil; in 1914-7 the French explorer, Lt.-Col. J. Tilho, used wireless signals from Paris to determine longitudes in his explorations of Tibesti, Borku, Erdi, and Ennedi; in 1917 Capt. A. J. Bamford determined the longitudes of Bagdad and Kermanshah by wireless signals from Fao, which had previously been connected with Basra; in 1919-20 the American traveller, Dr. A. Hamilton Rice, made use of wireless signals from Annapolis, Washington and Darien, to determine longitudes during his Amazonas expedition. Fig. 6 illustrates the wireless receiving set used by Dr. Hamilton Rice in 1919-20; it was designed by Mr. J. W. Swanson and Mr. P. F. Godley, and was found quite satisfactory and very portable.

It is safe to say that, in future, no properly equipped exploring expedition will be without its wireless receiving set. The designs of these sets will change from time to time and, no doubt, improvements will be made; but the method has proven to be thoroughly practical, and the extra amount of transport required is already of a negligible character. One of the greatest difficulties of the explorer has thus been removed.

#### Levelling

Since 1910 much progress has been made in the development of a sound system of levelling, especially with regard to precise, or geodetic levelling, *i.e.* that levelling which provides the framework on which all national levels depend. The now defunct International Geodetic Assn. laid down some wise rules for the subject of the precision of work of the highest standard. The admirable treatise of M. Ch. Lallemand, *Nivellement de haute Précision*, marked a great advance on previous text-books; and the production of the modern geodetic levelling instruments of France, the U.S. and Switzerland afforded the means of greatly increasing the accuracy of observation. To this should be added the introduction, by the Ordnance Survey of the United Kingdom, of a specially devised kind of permanent bench-mark, which did away with a weak element in the old levelling, the instability of the ground marks.

**Levelling Instruments.**—As a type of the instruments in use for levelling of high precision the level designed by Dr. Wildt, and made

Set packed for transport.

Receiver and Loop set up ready for use.

Receiving Signals.

FIG. 6.—Portable Receiving Set

by the Carl Zeiss optical works of Jena, may be taken. Levels of this kind are also manufactured by Messrs. T. Cooke & Sons of York and Messrs. E. R. Watts & Son of London. The instrument includes the following modern improvements which distinguish it from the levels used for rougher surveys or engineering work: the bubble is read from the eye end of the telescope, so that it is not necessary to disturb the instrument by walking to its side and bending over to read it; the final levelling of the instrument is effected by means of a slow-motion screw which slightly tilts the telescope; and the level is provided with a micrometer attachment in the form of a plate of glass with parallel faces in front of the object glass and this attachment can be tilted by means of a screw, the amount of the tilt being read on a graduated drum. The use of this micrometer attachment enables readings to be made by the intersection of graduations on the staff, instead of by estimation. It is essential in using this attachment that the sights should be of equal length. Various patterns of staves have been used by different survey departments. The Ordnance Survey, for the new geodetic levelling of England and Wales, used staves manufactured by the Cambridge Mathematical Instrument Company. These staves are 10 ft. long and the graduations are marked on a strip of invar (an alloy of steel and nickel which has a very low factor of expansion); fixed to each staff is a circular level, for the staff-holder to keep it vertical.

**Ground Marks.**—The ground marks to which the observations are taken in the field are of various kinds and are known in British surveying as bench marks. The bench marks in use on the Ordnance Survey are: first class or fundamental; second class, which consist of flush brackets made of bronze let into a wall or other vertical surface, and fixed with cement; rivets, let into horizontal surfaces, such as pavements; and, third class, bench marks cut with a chisel in brick or stone walls, of broad-arrow shape.

The fundamental bench marks are new. It is well known that bench marks of the ordinary type are in general unstable; walls or houses are pulled down, or are subject to settlement, bench marks on isolated stones have been known to be moved and set up in new positions, marks on pavements or kerbs are shifted. None of the old types of bench marks is satisfactory as constituting permanent records of height and position. Moreover, in certain localities, such as mining areas and clay hillsides, the ground itself is unstable. It was therefore decided in planning the geodetic levelling of England and Wales that fundamental bench marks would be devised which should be of a very stable nature. These are established at intervals of about 25 m. from each other; the sites are carefully chosen and no bench mark of this kind is placed on loose soil or rock liable to local disturbance. In constructing such a mark a pit is dug through the soil, sub-soil and loose rock, until sound rock, or hard chalk, is found. The bottom and sides of the pit are lined with concrete, and two reference marks are placed in the bottom concrete, one of bronze and one of polished flint; these are covered with removable caps of metal. When the observations have been finished the pit is filled with sand or other suitable dry material. The internal marks described are those which are used for departmental purposes; but, for the public, an external mark is also provided. It is hoped that these marks will last for many hundreds of years and will, in the future, afford valuable information with regard to vertical movements of the crust of the earth.

**Method of Observation.**—The system of carrying out the observations in the field is based on the following principles. In order to minimize the effect of systematic error the levelling of any line is carried out once in each direction; the interval of time between successive levellings should be as short as possible; to minimize the effect of inclination of the line of sight the distances from the instrument to the fore and back staves should be as nearly equal as possible; to

enable the graduations on the staves to be read easily the length of a space between the two staves is not in precise work to exceed 100 yds.; to reduce the effect of refraction, no reading is allowed even with the lower stadia hairs nearer than 6 in. from the lower end of a staff; observations are not allowed in bad or windy weather; the level is to be shielded from the direct rays of the sun.

It is on the observance of these and other common sense rules that the accuracy of the work will largely depend, and great attention must be paid to details, such as keeping the staves truly vertical or not letting the staff fall heavily on the picket or bench mark.

**Errors.**—The errors to which levelling is subject may be divided into those due to the staff, those due to the level, those due to the staff-holder, those due to the observer, and those due to the state of the ground, atmospheric conditions and unknown causes. The system of observation above described is directed towards eliminating, as far as possible, all errors not purely personal. Ultimately, when everything is done to evolve a sound system, it is the human element which tells most in the result, and the observer should possess excellent eyesight, a good stock of patience and be scrupulously honest; for in this, as in all scientific measurement, there must not be the least bias or wish to obtain a particular result. If the errors were all accidental and subject to the ordinary law, the probable error should increase as the square root of the distance levelled. There is, however, in levelling, a factor known as the "systematic error," by which the far end of a line constantly tends to appear the lower. If this systematic error were quite uniform, then double levelling would completely eliminate it; but this is not quite the case, and in the result, we are left with errors mainly accidental, plus an unknown amount of error not strictly subject to the law of accidental errors. A careful investigation by the Ordnance Survey has shown that the safest course, and that most in accordance with the conditions of the case, is to treat the whole error as accidental and as accumulating in proportion to the square root of the length of the line levelled. This is contrary to French practice. The probable error of 1 m. of double levelling is usually calculated from the formula  $e = 0.67 (\Sigma d^2 / 4M)$ , where  $\Sigma d^2$  is the sum of the squares of the discrepancies between the forward and back levelling from mark to mark, and  $M$  the length of the line in miles. The value of the probable error so obtained will usually be less than that obtained from a consideration of the closing errors. In recent Ordnance Survey precise levelling the value of  $e$ , from the above formula, is found to be somewhat less than .003 ft., whereas the value found from a discussion of the actual errors of closure of the level network is .0077. The probable error accumulated in the network between Newlyn in Cornwall and Dunbar in Haddingtonshire, two places separated by about 700 m. of levelling, is 0.16 ft., or about 2 in. This figure will serve to give an idea of the accuracy of modern precise levelling.

**AUTHORITIES.**—See Close & Cox, *Text Book of Topographical and Geographical Surveying* (H.M. Stationery Office, London, 1913); Middleton & Chadwick, *A Treatise on Surveying* (1911), chiefly of value for engineering surveys; W. Norman Thomas, *Surveying* (1920). (C. F. CL.; H. S. L. W.)

#### NAUTICAL SURVEYING

Although the World War restricted hydrographic surveying work, it led to improvements in methods and in instruments.

So far as the British Naval Surveying Service was concerned, it had generally been considered before that a marine survey need not be carried out with the degree of accuracy which is rightly considered necessary in purely land surveys; it being

contended that so long as a marine survey was graphically correct very little attention need be paid to topographical details. Before the war the delineation of topographical details was but a secondary consideration in a hydrographical survey, and it was limited to the accurate fixing of objects conspicuous from seaward; contouring, except in large harbour plans, was generally sketched in by form lines. The experiences in the World War showed that in localities of possible strategic value accurate topography is of great importance. Where no land surveys are in existence or contemplated, the delineation of the land features must be included in the hydrographical survey. The lack of information due to the neglect of this important subject was much felt during certain operations of the war, particularly as affecting long range naval bombardments. The necessity for this accurate work on the part of the hydrographic surveyor has resulted in the adoption of new methods and of new instruments and the more general use of the land surveyor's instruments, all of which undoubtedly tends towards the more accurate charting of the seas. The elaborate methods and rigid accuracy of a triangulation on shore have been recognized by marine surveyors, although the refinement necessary for so-called first-class triangulation work does not often present itself.

**Instruments.**—Theodolites in current use (1921) are 4 in., 5 in. and 6 in. The majority of these, formerly graduated to one minute, read to 20 sec. by Vernier, and micrometer theodolites read to 10 seconds. The use of the theodolite for astronomical and tachometer work largely increased. Sextants for observing, with stand and artificial horizon, continue in use, but improvements in the sextant such as an endless tangent screw and electric light for night work have been adopted. More portable folding stands with slow-motion screws for movement of the sextant in azimuth and altitude are also supplied, and in addition amalgamated troughs, consisting of gold-covered plates on which a thin film of mercury is floated, have superseded the old artificial horizon consisting of a mercury bath; the new pattern is far less sensitive to earth tremors caused by surf, traffic, etc.

**The Astrolabe à Prisme**, a very precise instrument for finding position, enables altitudes of any stars at the exact altitude of 60° to be observed (see John Ball and H. Knox Shaw, *A Handbook of the Prismatic Astrolabe*, published by the Egyptian Government, Cairo Government Press, 1919).

Measuring chains have been almost entirely superseded by 100-ft. and 500-ft. steel measuring tapes, which are supplied with standardization certificates. The "10-ft. pole" has been supplemented by a "20-ft. pole" operated by two men and consisting of two boards connected by a wire 20 ft. in length and used in conjunction with a sextant. This method of measuring distance is, however, being gradually superseded by the use of tachometers and tachometer staves marked according to the Admiralty pattern, with which distances up to over 2,000 ft. can be very accurately measured.

One-metre base range-finders are useful in measuring short bases for plans of harbours, etc., when time or circumstances do not permit of a more accurate method.

Of the various forms of heliostat the Galton sun signal has proved a most excellent instrument, and fitted to theodolites it allows of the sun's rays being expeditiously and accurately directed to, and kept on, the station desired, whether the latter is visible or not.

**Ship sounding** has been greatly improved by the introduction of the Douglas Schäfer sounding gear, which enables ship sounding to be carried out under way in any depth up to about 40 fathoms with great speed; other methods of sounding such as the "Somerville" gear have also been adopted, and in addition, far greater attention has been paid to sweeping for rocks, shoals, etc., the method used for mine-sweeping having been adapted to this purpose.

Other entirely different methods of sounding were also due to experience gained during the war. The most popular method under trial in 1921 was "Acoustic Depth Sounding" which depends on the principle of the acoustic echo, the depth being measured by the time taken for the shock of an explosion or other impulse produced in a ship to reach the bottom and be reflected back as an echo to a receiver on board the ship. By this device it was hoped to obtain either a single indication of the exact depth at any moment or a continuous indication of the depth registered automatically at any selected position. The importance of this method of sounding from a ship under way at any speed, without the necessity of casting the lead, needs no insisting upon.

**Taut wire measuring gear** was in 1921 fitted or being fitted to all British surveying ships. This method of measuring distances at sea in comparatively shallow depths had proved most successful and was adopted after having been extensively used in connexion with mine-laying during the war. The ship preserves a steady course and at a constant speed over the distance to be measured and at the same time runs out a thin piano wire from a drum which carries many miles of the wire. It is laid taut by means of a special brake

device, the amount of wire out being registered on a dial. A correction (always subtractive) must be made for errors. This varies from 1,000 to 3,000 ft. in a distance of 100 m., and is governed by the contours of the sea bed upon which the wire has been laid. The dial registers 1,000 rev. for a mile of 6,080 ft., consequently when plotting in sea miles a second correction, for latitude, is necessary. This method of determining distance is specially useful when surveying out of sight of land, and is used in combination with astronomical observations and moored beacons.

**Fixing Positions of Ships, Buoys, etc., by Subaqueous Sound-ranging.**—This new method of accurately fixing the positions of buoys, etc., is carried out by dropping an explosive charge at the position it is required to fix. The sound of the explosion travels through the water to a number of hydrophones suitably placed, and the positions of which are accurately known. The differences between the times at which the shock reaches the various hydrophones are recorded photographically by a galvanometer on shore, to which the instruments are connected by cables. From these observations it is possible to calculate a position line for each pair of hydrophones. Three or four such lines from hydrophones suitably placed will give a cut, which is the position of the explosion.

As in all surveying problems, the accurate fixing of a point from two others depends on the length of the base, that is, the distance between two known points, so does the accurate fixing by sound through the water depend on the hydrophones, or groups of hydrophones being such a distance apart, commensurate with the distance at which it is required to fix the buoy, etc.

**Chronometers.**—Surveying ships are now supplied with from 8 to 12 chronometers of the box type, with pocket chronometers for use outside the chronometer room. The chronometers supplied are selected instruments which have successfully passed most exhaustive tests at the Royal Observatory, Greenwich. For astronomical work on shore, the portable Lindqvist chronograph is employed. In this instrument, a chronometer fitted with special contact pieces automatically sends an electric current every two seconds through an electro-magnetic coil, and thus, by suitable mechanism records every alternate second as a perforation on a paper tape, which is kept moving at a uniform rate by means of clockwork. The closing of a switch by the observer operates a second coil, which records the instant of observation in a similar manner by making an additional perforation in the tape.

**Wireless Telegraphy** for accurate time and obtaining meridian distances has been adopted, and in this connexion the wireless Vernier time signals made by Eiffel Tower may be mentioned.

Amongst minor improvements introduced in surveying appliances since 1910 may be mentioned the standardization of the markings of leadlines, improved buoys for beacon work, light filters for fitting to the eyepieces of sextant and theodolite telescopes.

By 1921, platinum and stainless steel mirrors for sextants and sun signals were under trial; electrical lighting arrangements to sextants and theodolites; eye shields for use in observing to assist in perfect orientation of the head; sextant supports to facilitate observations at sea; the arcless sextant which enables angles to be taken and read off (on a drum) without the necessity of removing the eye from the telescope; wireless telegraphy outfits for use of detached parties, and the gyro compass, were all in various stages of experimental development. The Pillsbury current meter was entirely superseded by the Ekman current meter, and other meters such as the Daisy and Gurley were in use.

In calculating triangulations considerable time is saved in correcting for false station by use of the station corrector diagram, by which the correction can be obtained very quickly to any accuracy required (generally about 5 sec. of arc) and the tedious trigonometrical calculation avoided. The slide rule has come far more into prominence for small rough calculations. As the result of modern inventions, it has been found necessary in recent years to produce special charts for the use of submarines and for other purposes in addition to the ordinary navigational chart. Charts for submarines indicate graphically the nature of the sea bottom, so as to indicate where vessels can rest with safety.

The introduction of wireless direction-finding stations as an aid to navigation has necessitated the production of charts drawn on the gnomonic projection, by the use of which positions can be more accurately determined. Additional charts are also required for testing range-finders and compass adjusting. Physical charts indicate the direction of prevailing winds and ocean surface currents at different periods of the year, localities and time where ice may be fallen in with, and the direction and force of the stream and drift currents of the oceans.

Considerable gain in accuracy has been obtained by printing charts directly on backed paper, whereby the distortion incidental to the old system of subsequently mounting them is largely eliminated. (H. P. D.)

**SUTTNER, BERTHA**, BARONESS VON (1843-1914), Austrian writer (see 26.171), who in 1911 became a member of the advisory council of the Carnegie Peace Foundation, died at Vienna, June 21 1914.

See H. v. der Mandere, *Bertha Suttner* (1909).

**SUTTON, SIR HENRY** (1845-1920), English judge, was born Jan. 10 1845. He was educated at Rugby and Christ's College, Cambridge, where he graduated in 1868. He was called to the bar in 1870, in 1890 was made junior counsel to the Treasury, and in 1905 was raised to the King's Bench division, being knighted in 1906. He retired in 1910, and died in London May 30 1920.

**SVENDSEN, JOHANN SEVERIN** (1840-1911), Norwegian composer (see 26.175), died at Copenhagen June 14 1911.

**SWAN, SIR JOSEPH WILSON** (1828-1914), English physicist (see 26.170), died at Warrington, Surrey, May 28 1914.

**SWAYTHING, SAMUEL MONTAGU, 1ST BARON** (1832-1911), British financier, was born at Liverpool Dec. 21 1832, and came of a Jewish family named Samuel, but afterwards took by royal licence the name of Montagu. Beginning in early life in a very humble way of business he gradually acquired great wealth by enlarging its scope, and he rose to the head of the most important arbitrage house in London. A strong Liberal in politics, he sat in Parliament for the Tower Hamlets from 1885 to 1900; he was a member of the Gold and Silver commission of 1887-90, being himself a bimetalist. He was created a baronet in 1894, and raised to the peerage in 1907. Throughout his life he was a zealous promoter of Jewish interests, founding the loan fund of the Jewish board of guardians, the Jewish working men's club and several synagogues, and for his work on emigration schemes for the persecuted Russian Jews he made many journeys in Europe and America, succeeding Sir Julian Goldsmid as chairman of the Russo-Jewish Committee. He also helped to establish a modern secular school for Jews at Jerusalem in 1875. He died in London Jan. 12 1911, being succeeded in the title by his eldest son, Louis Samuel Montagu (b. 1869). His second son, Edwin Samuel Montagu (b. 1879), entered politics, and, after having been Under-secretary for India (1910-4), Chancellor of the Duchy of Lancaster (1915), Financial Secretary to the Treasury (1914-6) and Minister of Munitions (1916), was made Secretary of State for India in 1917. His fourth daughter, Lilian Helen (b. 1873), became a well-known social worker and was appointed J.P. for the County of London in July, 1920.

**SWEDEN** (see 26.188).—The Swedish census of 1910 showed an increase since 1900 of 7.5%, from 5,136,441 to 5,522,403 inhabitants. The pop. on Jan. 1 1920 was 5,847,037 (2,868,395 males and 2,978,642 females), of whom 1,701,249 were living in cities, distributed as follows: Norrland (northern division) 1,018,009, Svealand (central division) 1,879,146 and Götaland (southern division) 2,949,882. The density of pop. is rather low; in Götaland 34, Svealand 23 and Norrland only 4 inhabitants per square kilometre. The chief towns with a pop. exceeding 20,000 inhabitants (Jan. 1 1920) were Stockholm (415,201), Gothenburg (200,577), Malmö (111,931), Norrköping (57,377), Helsingborg (45,805), Gävle (36,092), Örebro (35,096), Eskilstuna (30,103), Västerås (29,530), Jönköping (28,875), Uppsala (28,041), Karlskrona (27,029), Linköping (26,300), Borås (23,941) and Lund (22,827).

The excess of births over deaths is low: 10.6 per 1,000 in 1910, 6.9 in 1915 and 5.2 in 1919. The birth-rate for 1919 was 19.6 per 1,000. There were 24,704 emigrants in 1906, 27,816 in 1910, 7,512 in 1915, 10,571 in 1916, 6,440 in 1917, 4,853 in 1918, 7,337 in 1919. During the war emigration was naturally difficult. The immigration figures were: 6,357 in 1915, 6,713 in 1916, 5,811 in 1917, 4,932 in 1918, 7,809 in 1919. The United States received the largest contingent of the emigrants, but Norway, Denmark and Canada also received considerable numbers. Swedes resident abroad number between 2,120,000 and 2,245,000, of whom 1,500,000 are in America and 370,000 in Finland.

**Occupations.**—Agriculture, fishing and forestry provided 48.4% of the pop. with their livelihood in 1910; in 1900 the percentage had been 54.4, and in 1890 61.51, the decline having been progressive since 1840, when the percentage was 80.9.

Those dependent on employment in industry, mining, trade and communications represented 45.8% of the pop. in 1910, as against 38.8% in 1900, 31% in 1890 and 10.1% in 1840. Those following the so-called "free crafts" (*fria yrken*) or engaged in the public service (*allmän tjänst*) represented 4.8% in 1910 (6.8% in 1900, 7.5% in 1890 and 8.4% in 1840). The most significant feature in this de-

velopment is the increased importance of the industrial sector. The census figures for 1920 in this respect were not available in 1921, but this section now represents half the population.

**Agriculture.**—Cultivated soil included 3,723,000 hectares in 1915, 1,715,000 hectares being used for grain, 1,411,000 for fodder stuffs, 26,100 for root crops, 3,000 for other crops, and 333,000 being left fallow. Gardens in 1915 occupied 47,533 hectares. The total value of the harvests in 1914 was estimated at 1,112,000,000 kr. and in 1920 at 2,012,000,000 kronor. The annual consumption of wheat in 1920 was 47.7 kgm. per person in 1891 to 87.8 in 1915. The consumption of rye diminished from 110.6 in 1891 to 98.1 in 1915. The country's own production of corn has not been sufficient, and large supplies have been imported. During the decade previous to the war about 50% of the wheat was imported, and from 10% to 15% of the rye. The ease with which corn could be imported militated against all attempts to make the country self-supporting in this respect, and efforts came to be concentrated on stock-raising. The number of horses in 1916 was 701,099, of cattle 2,913,159, and of pigs 1,065,396. It was the agricultural policy of the country before the war to import a considerable amount of the corn required and large supplies of maize, oilcakes and other fodder stuffs, and in their place to export live stock, butter and cheese. The balance was not in Sweden's favour if seen merely from an agricultural standpoint. In 1913 there was an exportation surplus for live stock of 16,500,000 kr. for butter and cheese of 46,700,000 kr., but there was an importation surplus for other animal products of 25,400,000 kr.; for grain, potatoes and seed corn of 58,600,000 kr.; for fodder stuffs of 22,800,000 kr. and for manure of 14,800,000 kr. The balance showed an importation surplus of 53,300,000 kr. Some decades earlier the country was as good as self-supporting, but the great industrial population has come into being since then and conditions of life have been radically changed thereby.

A more intense cultivation of the soil has been carried out with great energy. The splitting up of the land for the most part into small holdings has been a disadvantage to a certain extent. The large farms lead the way, and in localities where modern methods of agriculture sufficiently prevail the small farmers join together in cooperative societies. The scientific study of plant-growing and of manures is carried on in different parts of the country under the guidance of a central institute in Stockholm. Seeds have been greatly improved under the influences of the seed society in Svalöv (in Skåne), which also exports seeds. The Swedish moss cultivation society, which has its headquarters in Jönköping, has taken the lead in the systematic cultivation of the country's wealth in bogland.

Fishing contributes considerably towards the support of the population. The value of a year's catch may be estimated at between 20,000,000 and 30,000,000 kronor. Export of fish provides a balance of gain to the country of some millions of kronor a year. During the years of the World War measures were taken to promote the consumption of fish in Sweden itself.

**Forestry.**—Out of Sweden's total land area, which amounts to 41,000,000 hectares, 21,400,000, or nearly 52%, constitute forest-bearing land, whereof about 4,900,000 hectares, or 23.1%, are public property. In 1913 the output of sawed or planed timber was estimated at 7,800,000 cub. metres, mechanical wood pulp 326,000 tons, chemical wood pulp 860,000 tons, charcoal 4,300,000 cub. metres, and other products 18,500,000 cub. metres. In the same year the exports of planed sawn and planed wood were valued at 186,900,000 kr., of partly worked wood at 28,600,000 kr., and of wood-pulp at 99,700,000 kr., or 115,200,000 kr. altogether. These exports amounted to 38.6% of the total exports of the country. In certain years the exports of the products of the forests have amounted in value to half the total exports of Sweden. The economic world crisis after the war naturally caused a great diminution in export.

**Industry.**—Sweden is also rich in iron ore, and her water-falls make her well equipped for industrial enterprises. But coal is to be found in only one province, Skåne, and she is obliged to import large supplies of both coal and coke. The great distances for transport, moreover, entail heavy freight costs. Workmen enjoy a correspondingly high standard of living.

In 1915 the products of manufactures and mines had a value of something over 3,000,000,000 kronor. The extent to which Swedish industries had developed may be seen from the fact that the amount of horse-power in machinery per 1,000 workers had increased to 3,532 in 1915, from 2,841 in 1911 and 1,980 in 1906. The most important wood-sawing industries are found on the coast of Norrland, notably around Sundsvall and HERNÖSAND. The timber is floated down the big rivers from the forests. Paper pulp is one of Sweden's most important exports. Paper is another. The exports of mechanical wood-pulp (dry weight) in 1915 amounted to 150,103 tons, of which 80,783 went to Great Britain. In the same year Sweden exported 721,786 tons (dry weight) of chemical paper-pulp, of which 298,056 went to Great Britain. The iron industry is to be found within a broad belt of land nearly level with Stockholm and a little farther to the north. The use of charcoal has helped to make practicable the manufacture of Swedish high-quality steel. In 1915 there were 135 iron-works (with 28,868 workmen), of which 78 had in all 120 furnaces in use, producing 7,982 tons of pig-iron and 11,773 tons of castings. The exports of iron and steel in 1915 had a value of 97,600,000 kr., as compared with imports of 27,800,000

kronor. Foundries and mechanical engineering works in 1915 had an output of 339,600,000 kr.; exports were valued at 115,600,000 kr., as compared with imports of 41,400,000 kronor.

During the war some industries thrived exceedingly, as, for instance, those of iron, paper-pulp and paper; others suffered appreciably at times from the lack of raw materials, as, for instance, the textile industry. During the second half of 1920 and in 1921 industry was hit hard by the economic crisis.

*Commerce.*—Sweden's foreign trade in 1910-20 presented a curious picture, inasmuch as the value of her exports during the war period exceeded that of her imports. In 1910 her imports amounted to 669,200,000 kr. and her exports to 592,900,000; the corresponding figures for 1914 were 726,900,000 and 772,400,000. The figures for the subsequent war years were as follows: 1915, imports 1,142,500,000 kr. and exports 1,316,400,000 kr.; 1916, imports 1,138,600,000 kr. and exports 1,556,400,000 kr.; 1917, imports 758,600,000 kr. and exports 1,349,600,000 kr.; 1918, imports 1,233,300,000 kr. and exports 1,350,400,000 kr. After the war the picture changes. In 1919 the figures were: imports 2,534,000,000 kr. and exports 1,575,700,000 kr.; in 1920 imports 3,373,500,000 kr. and exports 2,293,500,000 kr. It will be noted how goods were regularly drawn out of the country during the war, while the imports were inadequate. The circumstance that home-grown wood was to a great extent used instead of imported coal also counted. When the war came to an end the country lacked reserve stocks and needed many articles of consumption. Importation increased, in part on speculative lines, from Germany and Russia, and with results which for the most part were unfortunate.

It may be interesting to give figures illustrating Sweden's commercial relations with the leading belligerent Powers. In 1913 imports into Sweden amounted to 846,500,000 kr.; exports from Sweden to 817,300,000. Her imports from Great Britain amounted to 206,800,000 kr. and those from Germany to 289,900,000 kr.; her exports to Great Britain amounted to 237,300,000 kr. and those to Germany to 179,100,000. Her transactions with Germany were somewhat in excess of those with Great Britain, but the latter country came first as purchaser of Swedish products. During the war a great reduction came. Imports into Sweden from Great Britain amounted to 183,800,000 kr. in 1914; 213,500,000 kr. in 1915; 164,400,000 kr. in 1916; 65,100,000 kr. in 1917; 148,700,000 kr. in 1918 and 668,900,000 kr. in 1919. Imports from Germany came to 238,600,000 kr. in 1914; 251,500,000 kr. in 1915; 429,200,000 kr. in 1916; 288,200,000 kr. in 1917; 447,900,000 kr. in 1918 and 269,100,000 kr. in 1919.

Exports to Great Britain amounted to 258,300,000 kr. in 1914; 329,600,000 kr. in 1915; 320,100,000 kr. in 1916; 216,100,000 kr. in 1917; 252,600,000 kr. in 1918; 509,900,000 kr. in 1919. Exports to Germany came to 174,800,000 kr. in 1914; 486,400,000 kr. in 1915; 437,500,000 kr. in 1916; 352,100,000 kr. in 1917; 292,800,000 kr. in 1918 and 130,800,000 kr. in 1919. During the war years British coal imports into Sweden declined, and Germany largely made good the deficiency, being naturally anxious to secure imports from Sweden. The figures for the Swedish importation of coal and coke, in thousands of tons, during the years 1913-7 were: from England, 4,916; 4,683; 2,816; 1,707 and 604; and from Germany, 431; 335; 2,174; 4,281 and 1,708. It will be seen how energetically Germany came forward in Great Britain's place as exporter to Sweden.

*Shipping.*—The Swedish commercial fleet in 1910 included 1,214 steamers and motor-boats, of 842,460 total tonnage dead-weight; in 1915 1,278 vessels, of 984,799 tonnage; in 1918 1,238 vessels, of 894,260 tonnage. The figures for sailing vessels were in 1910 1,635, of 204,624 tonnage; in 1915 1,422, of 161,650; and in 1918 1,295, of 141,396. The diminution was due partly to war-losses.

*Communications.*—The Swedish railway system had in 1910 a length of 13,829 km., and in 1919 of 15,154, whereof 4,418 and 5,496 respectively were State railways. Through the thinly populated interior region of Norland there runs a State railway line which has been opened for traffic between Östersund and Vilhelmina. A single line railway along the coast of Norland has been planned out and begun with aid from the State. During the war the railways were sometimes quite overloaded, so that locomotives could not be repaired to the extent they needed, and lubricants and good coal ran short. The increased costs drove up passenger and goods rates.

During 1909-16 the Trollhätte canal was reconstructed and deepened to four metres. The Södertälje canal was in 1921 in process of reconstruction and of deepening to five metres. Through the former operation navigation was made possible to the great Lake Venner and thus between Gothenburg (Göteborg) and the Western mining district, and through the latter a good waterway was being created to the harbour of Lake Mälär.

*Social Conditions.*—Democracy has a strong hold on the Swedish people, owing to the high degree of education reached by the masses and to their inherited respect for the sanctity of law. Familiarized from an early date with self-government, Sweden had begun already in the closing decades of the 19th century to build up a kind of network of nonconformist religious associations, Anglo-Saxon in their character, temperance unions and friendly societies. When, as the outcome of advances in industrialism, the labour movement began to take shape, it was able to utilize these habits of organization and thus secure a position of considerable power comparatively quickly.

Now more than 60% of Sweden's wage-earners belong to trade unions; at the beginning of 1921 these had over 400,000 members, of whom 280,000 combined to constitute the so-called "Lands Organisation," which may be translated as "The National Organization," while simultaneously the political side of the labour movement, Social Democracy, became a force of the first order. Swedish Social Democracy has relied more and more on parliamentary methods of reform, thereby awakening opposition on the part of the labour extremists, with the result that in 1917 a new Socialist party of the left came into existence, formed for the most part by young men, a large number of whom were strongly influenced by Russian Bolshevism. In the spring of 1921 these latter formed a Communistic party connected with the Third International in Moscow. The bulk of Swedish workmen, however, hold aloof from revolutionary tendencies, thanks to the great extension which has been attained by coöperation. While workmen constitute a typical class party, another class party formed by the association of farmers and countryfolk, under the title of the "Böndeförbund," dated its origin from 1917.

In 1913 a law was passed instituting compulsory old-age and disablement insurance for the entire population. In 1916 a similar accident insurance law was passed. The law passed in 1919 for an eight-hour day was the most advanced of any in Europe. The national administration includes a special social department, as well as a number of boards for dealing with social questions.

The communes also, especially the large towns, have instituted important social reforms; for instance, by creating public labour exchanges, which have been State-endowed since 1907 and are under State guidance and control. In common with the State, moreover, the communes contributed to the general pensions insurance. The guardianship of the poor used to rest on the primary communes, but, through a new Poor Law, passed in 1918, this burden is now in certain cases transferred to the provincial assemblies (Landsting) and the State.

The first decade of the 20th century was marked by the creation and swift growth of employers' associations (notably that known by the name "Svenska Arbetsgivare Föreningen," whose members in 1920 employed nearly 300,000 workmen) and also of associations of landowners; and in several great conflicts, as, for instance, in a five-weeks' general strike in the summer of 1909, in which 300,000 workmen took part, the victory fell to the employers. For a long time the State's only action in the matter remained the passing of a law in 1906 for the intervention of a Conciliation Court in labour disputes. By reason of the high standing, however, of the trade-union organizations, and as the result of frequent collective agreements on both sides, certain conventional methods of treaty came into vogue in the field of labour disputes. In 1920 the Riksdag passed a law instituting a central State conciliation and arbitration court, as well as local courts of the same kind, to pronounce judgment in labour disputes on the basis of their collective agreements.

*The Liquor Question.*—For close on a century past the alcohol question in Sweden has been a subject for the most serious consideration and for constant measures of reform. The unhappy results of the excessive consumption of gin at the beginning of the 19th century called forth an energetic temperance movement, led by a clergyman named Peter Wisselgren (1800-1877), a "domprost," or dean, of the Lutheran Church; and in 1855 a law was passed which abolished the right to manufacture gin for home consumption and which granted concessions to companies, with no financial interest in the traffic, to sell alcoholic drinks under public control. This "Gothenburg System," as it was designated, brought about considerable improvements in many respects, and the great temperance societies, with a total membership of 450,000, have worked in the same direction. It was, however, only by the new law regarding the sale of liquor which was passed in 1917, and which came into force in 1919, that the underlying principle ("disinterested management") of the Gothenburg System was consistently put into general practice. By this law the selling to individuals of drinks containing more than 3.6% of alcohol was confined exclusively to the so-called "systembolag" ("system company"), with about 150 branches, over the management of which the State authorities have decisive control and which pays over all its profits to the State Treasury except for 5% interest on the capital invested. The controlling of this "system company" is entrusted to a central institution known as "Kontrollstyrelsen." All persons who wish to purchase such liquors for home consumption are registered and receive a pass-book; the total amount of liquor allowed to them being limited to a maximum of four litres a month. The abuse of alcohol is attended by further restrictions or by the absolute withdrawal of the right to purchase. The amount of liquor which may be sold to a customer in a restaurant is also strictly limited and confined to meal-times. This system of liquor-dealing, which was set on foot in Stockholm in 1913 and organized by Dr. Ivan Bratt (coming to be known as the Bratt system), was supplemented by a special measure regarding the treatment of alcoholists. The system had remarkable results, proportionate in large degree to the activity of the leading members of the various companies. The consumption of spirits decreased in many places, for instance in Stockholm, by nearly 50%. The number of cases of drunkenness, which was formerly somewhat high, was reduced throughout the country—in Stockholm and in cer-

tain other places by 60%—and so was the number of persons suffering from alcoholism. Much opposition from the side of those who regard the restrictions introduced as altogether excessive was brought to bear against the system; on the other hand, a tendency arose among the temperance associations to believe that total prohibition was the only way towards the solution of the alcohol problem. Smuggling and illegal manufacture of spirits developed to a disquieting degree in the years 1917–8. There were signs, however, in 1921 of a return to a better state of things.

*Finance.*—In 1910 the state budget amounted to 265,200,000 kr., in 1915 to 415,400,000, in 1920 to 929,400,000, and in 1921 to 1,131,100,000. For 1920 and 1921 the so-called "tilläggsstaten," i.e. supplementary military budgets, are included. The tax revenue in 1921 amounted to 579,200,000 kronor. The consolidated national debt amounted at the end of 1920 to 1,280,600,000 kr.; in 1910 it had been 543,400,000 kronor.

Apart from the national bank, the Riksbank, which alone issues bank-notes, there were in 1910 17 private and 63 joint-stock banks, which in 1920 had decreased to 11 and 30 by amalgamations. Their total paid-up capital and reserve funds amounted in 1910 to 562,600,000 kr. and in 1920 to 1,084,000,000 kronor. At the end of 1920 the Riksbank balanced its revenue and expenditure at 1,017,500,000 kr. and the other banks' balance stood at 7,662,300,000 kronor. The leading private bank is Stockholm Enskilda Bank; the largest joint-stock banks are Skandinaviska Kreditaktiebolaget, Svenska Handelsbanken (formerly Stockholm Handelsbank) and Aktiebolaget Göteborgsbanken.

The circulation of paper money increased from 206,500,000 kr. in 1910 to 759,900,000 kr. in 1920. During the war years the Riksbank was relieved from its liability to meet notes with gold, and also to receive gold in ingots (*see EXCHANGES, FOREIGN*).

The Swedish savings banks in 1919 numbered 477; their deposits amounted to 1,870,800,000 kr. and their capital to 107,100,000 kronor. The post-office savings bank, a State institution, had deposits amounting to 84,400,000 kr. at the end of 1920.

*Constitution.*—The Swedish Parliament, the "Riksdag," consists of two elected Chambers, the First Chamber being composed of communal representatives. A constitutional change of a radical kind took place in 1907 and was confirmed by the Riksdag in 1909. The communal suffrage was on a scale proportionate to income, the graduation was now limited so that no person could have more than 40 votes, the bulk of the middle classes thus acquiring a preponderance. Absent voters could delegate their voting rights to others. Women had the communal suffrage in proportion to the degree in which they themselves were liable to taxation. Proportional representation was introduced in the case of both Chambers. Members of the First Chamber, in common with those of the Second, were paid. The suffrage in the case of the Second Chamber became universal and remained, as before, equal for all.

By Riksdag resolutions in 1918, 1919 and 1921 the constitution was further developed in a markedly democratic direction. Under these reforms the First Chamber consists of 150 members, elected by proportional representation by the provincial assemblies, i.e. either by "Landstingen" or by specially formed bodies of electors, chosen also by proportional representation by those possessing the communal suffrage. The communal suffrage is universal and equal; it is no longer graduated and it is personal. When it was graduated in proportion to income, business communities possessed the communal suffrage. Anyone who fails to pay his taxes for three successive years forfeits his right to vote. Women have the same voting rights as men. The age at which the voting right is acquired is 23, but the age is 27 for the right to vote for the members of the provincial assemblies which elect the First Chamber. The right to vote by proxy is abolished, but a husband may deliver a wife's vote in a closed envelope, or a wife a husband's. Similarly, in the case of both the communal elections and the elections to the Second Chamber, soldiers on active service, absent seamen and fishermen, and employees of railways, ports, customs and pilot services may send in their votes by post.

The number of the voters in the communes has been more than doubled. After the reform the communes' lists of voters contained nearly 3,300,000 names, i.e. more than 56% of the pop., and of these about 1,600,000 were men and 1,700,000 women. In March and April 1919 took place the new communal assembly elections: in two 'Landsting' out of 25, and in 20 towns out of 107 (among them Stockholm), the Social Democrats and Socialists of the Left together won absolute majorities. In ten 'Landsting' and 38 towns the Social Democrats were the strongest party. The election periods are eight years for the members of the First Chamber, one-eighth of whose number are elected each year; and four years for the Second Chamber's 230 members, who are all elected at one time. Women as well as men are eligible as members of both Chambers. The age at which a person becomes eligible for the First Chamber is 35, for the second 23. To be eligible for the First Chamber a person must have a certain specified income or property. If a member can no longer perform his duties, his place is taken by a substitute elected at the same time as himself. The Riksdag is called together every year on Jan. 10 for its ordinary meeting.

In 1921 the Riksdag passed an Act to provide that a consultative referendum shall be had recourse to when the Government and the

Riksdag think it desirable to take the opinion of the people direct by plebiscite on some important question before its decision by the Riksdag. The proposal decided on must be submitted once again after a new Second Chamber election before it becomes binding. Another constitutional change was involved in the creation of a foreign affairs committee, which the Riksdag shall elect every year, and with which the Government shall take counsel regarding foreign affairs. The Riksdag's right to share in decisions regarding agreements with foreign countries has been extended. Yet another constitutional novelty is the right given to women to hold office under the State where no special hindrance lies in the way.

*HISTORY.*—On the death of King Oscar on Dec. 8 1907 he was succeeded by his eldest son Gustav V. Rear-Adm. Arvid Lindman had been at the head of the Government since May 1906, with Erik Trolle, former Swedish minister at Berlin, as Minister of Foreign Affairs; Carl Swartz, a manufacturer, as Minister of Finance; Maj.-Gen. Lars Tingsten as chief of the Department of National Defences, and Alfred Petersson i Påboda, a landowner, as Minister of Agriculture. In 1907 this Ministry had carried a measure of constitutional reform, embodying universal suffrage in regard to the Second Chamber and proportional representation in regard to both Chambers; and this measure, in accordance with statute, was confirmed by the Riksdag in 1909 after the election of members of the Second Chamber in the autumn of 1908. Owing to a divergence of opinion within the Ministry upon an important point bearing upon the extent of the Riksdag's powers, Trolle, Petersson and one other minister resigned in 1909. The new Foreign Minister was Count Arvid Taube, who had succeeded Trolle as representative of Sweden at Berlin. Some time afterwards Maj.-Gen. Tingsten also resigned. Moderate Conservatism was the note of this Ministry. The ministerial party in the Riksdag had a majority in the First Chamber and a minority in the Second.

*The National Defence Question.*—At this period the problem of national defence was in the forefront of Swedish politics, inasmuch as the foreign affairs of the country were in a condition calculated to arouse anxiety. The union with Norway had been dissolved in 1905 and Sweden now stood alone in respect to foreign politics. Finland, which in 1809 had been taken from Sweden and united to Russia, had been having its autonomy more and more reduced, and Russia's foreign policy seemed to show a forward tendency westwards. A great variety of new military measures in Finland seemed to point to something more than a desire on the part of the Russian Government to prevent a German invasion of Southern Finland in the event of a Russo-German war. Right up to the north of the Gulf of Bothnia a network of railways was being spread out for military purposes, and new strategic lines were constructed of a kind necessitated neither for purposes of defence against Germany nor for purposes of trade. Barracks sprang up at the railway junctions. In Sweden Russian spies were ubiquitous, and a Russian military attaché had to be recalled on the ground of having pushed inquisitiveness beyond all limits. A handbook was produced for the use of the Russian military service containing information about the conditions of life in Sweden, and with Swedish maps in it, as well as a short vocabulary of military terms in Russian and Swedish. Swedes had an uncomfortable feeling that the attention of Russia was being directed altogether too closely upon their inadequately defended country.

A careful enquiry into the question of national defence had been undertaken in 1907. The Liberal members of the committee of investigation which was appointed were dissatisfied with its estimate of the defence expenditure required, and signified their attitude by withdrawing from it in 1910. This militated somewhat against the efforts of the committee, and it proved to be impossible, as had been intended, to submit a new scheme of national defences to the Riksdag of 1911. Instead of this, the Government brought forward a proposal for a new naval programme, and, in the face of opposition from the Liberals and Social Democrats, carried a bill, as a first step, for the construction of a powerful new battle cruiser.

*Liberals in Office.*—In Sept. 1911 the general election for the Second Chamber of the Riksdag, under the reformed methods which had almost doubled the electorate, resulted in increasing

the strength of the parties of the Left. The Liberals elected numbered 101, the members of the Right numbering 65 and the Social Democrats 64. Admiral Lindman's Ministry resigned, and in Oct. the King entrusted Karl Staaff, who had been prime minister in 1905-6, with the task of forming a new Government. This Ministry remained in office until Feb. 1914. Count Albert Ehrensvard, previously Swedish minister at Washington, became Minister of Foreign Affairs, and both of the departments of national defence were placed under civilians, in accordance with the Liberal view that there should be greater civil control. Alfred Petersson, who had gone over to the Liberals, became once more Minister of Agriculture. The question of national defence again came up for treatment, but upon different lines and almost exclusively at the hands of the members of the Left. It had not been possible to proceed further with the projected new ironclad than the making out of the designs. The Government proposed to the Riksdag of 1912 that the project should be abandoned and the Riksdag agreed. This cancelling of a previous decision of the Riksdag, on account of the new elections having altered the composition of the Second Chamber, evoked strong dissatisfaction. Within a brief space of time a sum of 17,000,000 kr. was raised by voluntary subscription for the building of the ship, and since the Government was unable to decline to use this fund the keel was laid down on Dec. 1. The whole country was now stirred up, and further sums were subscribed in the same way to furnish machine-guns for the Landsturm and to provide aircraft. Towards the end of 1913 things had come to such a point that the prime minister was able in the course of a speech to advance arguments in favour of a forthcoming proposal for a winter training for the army, the establishment of reserve forces, the levying of a higher war-tax on the more well-to-do, the amelioration of the laws governing war, etc. But in view of the election promises to which the Liberal leaders had committed themselves during the contest of 1911 this programme was not to be submitted all at once; its most important item alone, that of the training of the infantry, would in the first place be submitted by itself on the occasion of the Second Chamber elections of 1914 before being proposed to the Riksdag. The public discussion of the matter became very lively, and although no thoroughgoing defence programme was in fact submitted to the Riksdag of 1914, violent feelings were aroused and expressed.

At last even the small farmers and peasantry, usually anything but enthusiasts for defence measures owing to the heavy personal taxation entailed, were drawn into the movement. On Feb. 6 1914 there was a great meeting in Stockholm of more than 30,000 representatives of this class from all parts of the country, assembled for the purpose of bringing home to King Gustav their anxiety at not seeing the question handled promptly and in its entirety. They were received by the King in the great courtyard of the Royal Palace, and their spokesman declared that the Swedish people were willing to bear the burden of whatever measures of defence were necessitated by the gravity of the time. The King answered that he, too, was of opinion that the problem called for treatment in its entirety and without delay.

This demonstration had important consequences at once. The Ministry had had no previous intimation of what the King was going to say, and matters were brought to a head by the resignation of Staaff and his colleagues. On Feb. 17 a new Ministry was formed, with Hjalmar Hammarskjöld as its head.

*Policy of Reform.*—In connexion with foreign affairs during this period it may be added that, by arbitration at The Hague, the sea boundary between Sweden and Norway was fixed in accordance with Sweden's claim, and Sweden became a party to the North Sea and Baltic Agreement of 1908. By dint of close co-operation between the Government and the Riksdag a large number of important reforms were instituted. Among those carried through during Adml. Lindman's administration may be mentioned (in addition to the franchise measures above noted) the creation of a supreme administrative Court of Justice (*Regerings rätten*), together with a legal council, formed of some members of the Supreme Court, as advisers to the Government in legislative matters. Civil marriages were made permissible

for all members of the State church. New laws were introduced as to farmers' tenancies and the leasing and letting of houses, flats, etc., and the speculative operations of the big companies dealing in land in Norrland were restricted and placed under control. A new company law was passed by the Riksdag and also a new banking law. A progressive income and property tax, based on the taxpayer's own statements as to both, was also introduced, together with a progressive inheritance tax. Custom-house duties were remodelled and the sugar-tax modified. An arrangement was come to with the Grängesberg Co. in regard to its iron-ore business in Lapland, by which the complicated question of proprietary rights was so settled that the State joined in as part owner, receiving preference shares to the value of 40,000,000 kr., a specified royalty on the proceeds of the mining at Gellivara and Kiruna and the right of redemption after a specified period. Large grants were made to the electric power stations at Trollhättan and Älvkarleby in central Sweden, as well as to that at Porjus in an uninhabited region of Lapland, and a widening of the Trollhätte canal was put in hand. A new law regarding insurance against illness was passed. Night work in certain occupations was forbidden for women. Improvements were made in higher technical education. In 1909 a sharp conflict arose between employers and workmen, and the latter organized a general strike in which nearly 300,000 took part. There were, however, no disturbances, thanks both to the discipline maintained and to the wise measures adopted by the Government. Social life was not brought to a standstill, as the workmen expected, and after a lapse of two months the conflict was brought to an end.

While the reforms introduced by Adml. Lindman's Ministry lay mainly in the sphere of economics and industry, the Staaff Ministry devoted its energies more especially towards social questions. A new social department was instituted, as a centre for the State's activities in this direction. The law bearing on the protection of workmen was extended, and various forms of workmen's unions were placed under control. A law was passed regulating the methods of dealing with alcoholists. The profits of the sale of spirits by the communes were allocated to the State, compensation being allowed therefor, the object of this being to free the communes from all economic interest in the liquor trade. After long preliminary planning, an illness and old-age pensions insurance law was passed, enacting obligatory insurance, with payments in three degrees, for all, except pensioners of the State, between the ages of 16 and 66, the pensions to be given in case of illness, or on the completion of the 67th year.

*The War Years, 1914-8.*—In the ministry which Herr Hammarskjöld formed in Feb. 1914 Herr K. A. Wallenberg, the banker, was Minister of Foreign Affairs; Herr Dan Broström, shipowner, Minister for Naval Defence, and Herr Oscar von Sydow was Minister of the Interior. The Second Chamber was dissolved, and after a very sharp contest the advocates of active defence measures were returned in increased numbers, but without having secured a majority, polling 86 seats out of 230, while the Liberals numbered 71 and the Social Democrats 73.

The Riksdag met again in May, and the outbreak of the war brought with it a solution of difficulties, inasmuch as all parties recognized that there must be no disputing as to details of defence at a moment when the whole surrounding world was aflame. Universal military service had already been introduced, but now the training time for infantry was increased to 340 days, of which 250 were to be spent in recruit classes beginning in the autumn and continuing throughout the winter, followed by the usual training courses during three years. In order to secure non-commissioned officers of the right kind it was judged well to impose a longer training time, extending to 485 days, on students and other young men of similar standing, while for cavalry and artillery the period was fixed at 365 days. Large sums were allotted for the provision of war materials and for the strengthening of the coast defences. A programme was drawn up for adding new vessels to the fleet. Simultaneously with these steps towards increasing the defences of the country, measures were introduced for modernizing the existing code of punishments for military

offences, this being accompanied by the creation of a special official, to be appointed by the Riksdag, whose duty it would be to inquire into all allegations regarding abuse of power or other derelictions on the part of superior officers in the army or navy—an appointment designed to act as a protection for soldiers and sailors against injustice.

An official declaration of neutrality was published without delay, and all the ministries holding office during the war, with the Riksdag's expressed approval, aimed at remaining absolutely neutral. Neutrality involved the duty of preventing any of the belligerent Powers from using Swedish territory as a basis for operations against enemies. Throughout the entire war the Swedish fleet remained on guard along the coasts of the country and on several occasions it had to take active measures. During the summer of 1916 there were many violations of neutrality in Swedish waters. In order to elude the observation of foreign battleships, trading vessels, flying the flags of belligerent countries, or carrying dangerous freights, sought to get through a channel called Kogrundsrännan within Swedish waters in Öresund, and apparently frequent attempts were to be expected on the side of belligerent countries at both ends of this channel to seize enemy vessels even at the risk of this occurring within Swedish waters. This channel was closed therefore against all but certain known Swedish vessels. The Allied Powers considered this action incorrect and protested, but the channel remained closed until Dec. 1918. A number of trading vessels belonging to the Allied Powers, which, owing to the closing of the channel, were confined in the Baltic, were, however, allowed egress on the condition that the Swedish population received a certain measure of necessary supplies from the west.

The stagnation produced by the outbreak of the war as regards foreign trade and shipping did not last long. Sweden became for a time, like Holland and Italy, an intermediary in the American trade with Germany, quite in accordance with international law as it stood before the war. When, however, the Allies proceeded to employ more and more stringently their weapon of blockade against the Central Powers this business as intermediary came quickly to a stop. The intensifying of the war at sea brought with it great obstacles in the way of neutral commerce. Its most painful feature was the sinking of neutral vessels by the German submarines, with its accompanying loss of lives. The mines which were spread about by other groups of belligerents also claimed many victims. The proceedings of the submarines caused forth much indignation, and protests were made, but without much effect. The measures of the Allies were of a different order, but their control over shipping presently became so oppressive that protests against this also were made, the weightiest protest coming from the three northern kingdoms acting together. Sweden's geographical position and the commercial conditions which existed before the war necessitated the maintaining of relations with both sides. Trade transactions with Germany were in 1913 somewhat in excess of those with Great Britain, but Great Britain was the larger purchaser of Swedish products. During the war one great displacement in trade resulted from the diminution of Sweden's imports of coal from Great Britain and the consequent necessity of making good this diminution by imports from Germany.

Despite all the difficulties to be encountered it proved possible to maintain importation into Sweden from the west of raw materials, grain and other necessities down to well on in 1916, but from this time onwards there was an increasing scarcity. When the Allies intensified their blockade, and Sweden could not break off trade relations with Germany, the blockade-line was drawn not between Sweden and the Central Powers but west of Sweden and the other Scandinavian countries. All goods which had to pass the blockade-line in the North Sea on the way to or from Sweden were subjected to sharp control. As regards goods from Sweden certificates of origin and ownership had to be furnished, to make sure that they were not in reality disguised exports from Germany, while in the case of goods for Sweden guarantees were required to the effect that they would not be forwarded to Germany. Suspected goods were unloaded in

British seaports. Black lists caused serious losses to conscientious tradesmen as well as to others. Both groups of belligerents set on foot elaborate systems of trade espionage in neutral countries. In order to regulate the undertakings which the belligerents demanded from merchants, manufacturers and shipowners, the so-called War Trade Law was passed in 1916 to give legal value to officially recognized undertakings to foreign Powers, while at the same time it was laid down that undertakings not thus recognized lacked all legal value. A special trades commission was created to investigate all questions connected with this matter. The international goods exchange came to be worked like an enormous system of compensation, controlled by State officials by means of agreement. Every neutral country had to offer some equivalent in return for its imports. During the first years of the war it was to the interest of the Allied Powers that goods should go through Sweden to Russia. The great consignments caused inconvenience to the Swedish railways, but they made things easier for Sweden in the matter of imports.

Negotiations were set on foot for a commercial agreement between Sweden and Great Britain and her Allies, but they led to no result during the time of Herr Hammarskjöld's Ministry, and this fact was turned to account against him in the political conflict which went on over the internal affairs of the country. After this Ministry resigned on Mar. 1 1917, and Herr Carl Swartz formed a new Government, the Foreign Minister, Adml. Lindman, brought about a temporary agreement by which the Swedish people were allowed the right to import nearly 92,000 tons of grain and about 40,000 tons of other goods, on the condition that certain vessels belonging to the Allies then confined in the Baltic should be allowed egress through the closed channel of Kogrund.

After Herr Eden's Ministry succeeded to that of Herr Swartz in the autumn new discussions were entered upon in regard to imports. In Feb. 1918 a so-called *modus vivendi* agreement was come to, enabling Sweden to import about 75,000 tons of maize, feeding-stuffs, raw phosphate, mineral oils and coffee, and in June a more comprehensive agreement was reached, in accordance with which it was possible to import larger quantities of grain, feeding-stuffs, coal, oils, india-rubber, cotton, wool, hides, etc. In this connexion Sweden placed at the disposal of the Allies a portion of her commercial fleet. In addition, Sweden guaranteed to the Allies a certain share in her iron-ore exports, and also undertook to allow a certain amount of credit for goods bought in Sweden. In this way Sweden's most essential import was made sure of until the end of the war. In consequence of the universal scarcity the three Scandinavian countries came to an agreement as to the mutual exchange of commodities.

The hard conditions which prevailed during the war brought Sweden and Norway closer together again. After the severance between Sweden and Norway in 1905, and the election of a Danish prince as King of Norway, the relations between the Scandinavian countries had been somewhat cold. King Gustav, who at one time had been the Norwegian Crown Prince, himself took the initiative, and in Dec. 1914 invited the Norwegian and Danish monarchs to a meeting at Malmö, at which the affairs of the three countries as affected by the war came under discussion. Other such consultations followed, for instance at Christiania in Nov. 1917, and the prime ministers and foreign ministers of the three kingdoms also came together, while on some occasions of importance there were meetings at which special delegates were present.

In Jan. 1918 Sweden gave her recognition to the new Finnish State. When, shortly afterwards, the Red outbreak occurred in Finland, there was a strong movement in favour of Sweden's joining in on the side of the newly formed Finnish Government, but when the Russian troops began to take part in the struggle on the side of the Reds, Russia continuing to be a belligerent Power, the Government and the Riksdag agreed that it would not be wise to intervene. Swedish volunteers fought on the side of the Whites, and a couple of Swedish ambulances were sent over. Swedish refugees were brought back from Southern Finland. While the civil war in Finland was still in progress a petition came from the inhabitants of the Åland Is. for Swedish

protection against aggression on the part of Russian troops which were stationed there. Troops were sent from Sweden to maintain order on the islands, and they achieved their purpose. When Germany, however, came to the support of the Whites and landed forces on the Åland Is., the Swedish troops were withdrawn.

*Economic Measures.*—At the very beginning of the war period the Swedish Government carried through several special administrative measures. The exportation of a number of commodities of great importance was prohibited, partly in order that they might be kept for home consumption, partly in order that they might control the exportation by export licences. This system was gradually developed until at last the export of *all* important goods was prohibited. An Industrial Commission and an Unemployment Commission were set up to decide on the measures which should be taken to maintain industrial work and to mitigate the serious condition of unemployment which threatened. A Food Commission was appointed to study the development of the market, and a National War Insurance Commission was charged with the task of dealing with insurances against loss of life and property through the war on the seas, as the private insurance companies were unable to undertake all the risks. The Riksdag's legislative powers were also called into play. A financial Moratorium was instituted at an early date. The Riksbank's obligation to meet its own notes with gold was suspended, and new laws were introduced giving the Government new powers, which were employed when necessary, to effect the compulsory purchase of goods from individuals and to fix maximum prices on commodities. Swedish vessels could not be sold to other countries without the Government's sanction, nor could they carry freight from one foreign country to another. All this accumulation of legal measures, which presently had added to it the law against unreasonable increases in rent, the law against "profiteering" and several others, did not come about at once but grew out of the needs which were created by the conditions of the war period. New organs for war-time administration were formed in the Trade Commission (June 1915) and the Food Control Commission (autumn 1916), the former of which had to apply the War Trade Laws and to supervise exports and imports, while the latter, as the successor of an earlier Food Commission, took in hand the food rationing of the country.

*Rationing.*—Before the war Sweden produced about four-sevenths of the cereals which she required; the rest had to be imported. On the other hand, she exported live cattle, pork and butter, the production of which was made possible by the importation of feeding-stuffs. The fodder harvest of 1914 was so scanty that it necessitated a reduction of live stock. The importation of cereals was undertaken by the State through the agency of the Food Commission. When there began to be a scarcity in some of the animal foods, and prices suddenly rose, recourse was had to the fixing of maximum prices for the first time in Nov. 1915. In the course of the year also the exportation of animal foods was restricted and producers were obliged, in return for the granting of export licences, to allot a certain proportion of their goods ("compensation goods" so-called) to the State for sale by the communal authorities at low prices to those who were less well-to-do. In the autumn of 1916 the scarcity of animal foods became so serious that rationing had to be decided on, and, even so, anxiety was occasionally felt lest the supplies should fail. The situation was aggravated later by the bad harvest of 1917. In Oct. 1916 it was decided that nobody should obtain sugar without presenting a sugar-card. These sugar-cards gave a person the right to purchase 13 kgm. of sugar a year, with an additional amount for preserving purposes to each family. In Jan. 1917 bread-cards were introduced. Farmers were allowed to retain a certain quantity of corn but had to sell all the surplus to the State. All such stores, whether bought by the State or imported, were rationed out to the rest of the population, who were given bread-cards providing at first allowances of 250 grammes a day to each person, later only 200 grammes, but again 250 in Nov. 1918. Persons engaged in particularly arduous work were allowed extra rations. The bread-cards were used also on journeys. The carrying out of this work of rationing needed very

thorough supervision, and this evoked dissatisfaction and annoyance, especially among the farmers. The system was changed in the food control year of 1918-9, each farmer being called upon to supply a certain specified quantity of corn and being allowed to do more or less as he pleased with what he had left. Rationing ceased at the end of Aug. 1919.

The supply of bread was scantier than in normal times, and it had to be supplemented with other food-stuffs, especially potatoes. The consumption of all these rose enormously and a great scarcity began to be felt, most severely in the late winter and in the spring of the year 1917 and 1918. People had to have recourse to the eating of turnips. In the spring of 1917 there were food riots in various localities. In 1918 the danger of famine became worse, but calm prevailed. In the autumn of that year potatoes also had to be rationed, but this expedient did not work well. In densely inhabited localities milk was so rationed that the needs in the first place of small children, then of pauper children and the old and the sick were supplied. The exportation of meat, including bacon and pork, ceased altogether in the first half of 1917. The scarcity of fodder became at times so intense that moss and heather and even pine-needles had to be employed as substitutes in the cow-sheds. The selling of bacon and pork was placed under strict control, but only with the result that both disappeared almost altogether from the open market. The rationing of butchers' meat was considered, but it was not thought safe to take this step. Among other things rationed was coffee. The scarcity of food generally caused the Government to do what it could to intensify production by the putting of new land into cultivation, etc.

*The Fuel Question.*—The fuel question was beset with difficulties although Sweden is so rich in wood. Before the war about 5,000,000 tons of coal and coke were imported, for the most part from England. When, during the war, the importation from England ceased, and Germany was unable to supply as much as England used to do, the country was faced by a very serious scarcity of fuel. This was at the beginning of 1917. The regulation of the business of the wood supply was then entrusted to the Fuel Commission, which put wood-cutting operations in hand on an enormous scale. In Nov. 1917 56,000 workmen were in employment at wood-cutting. Down to May 1918, when the work ceased for the most part, 19,400,000 cub. metres of wood had been cut. Forest owners were allowed to make provision for their own needs. Other households had certain specified quantities allotted to them, according to the number of persons in each, special wood-cards being provided and the price of the wood being fixed at figures which did not quite cover the cost. Those persons who wished to buy more could do so but at higher figures. Factories and railways had to pay higher prices. The result was that fuel was always available in sufficient quantities, but that the wood supply involved a loss to the State of over 100,000,000 kronor.

*Industry during the War.*—The importation difficulties reacted also upon industries. There was a great scarcity of lubricants. This was partly met by the use of substitutes. The textiles, rubber and leather industries, as well as several branches of the chemical industry, suffered from the lack of raw materials. The scarcity of copper and certain other metals and metal alloys had injurious results on the working of electrical machinery and generally throughout the whole sphere of mechanical engineering, but, on the whole, Swedish industries were kept going under favourable conditions. To deal with the importation of raw materials, which was controlled by the Allies, import associations were formed by the manufacturers who needed the raw materials in question. These associations furnished the guarantees required by the Allies and imposed corresponding guarantees on the delivery of the small quantities thus dealt out. The associations were controlled by the Trade and Industry Commissions. In cases where the supply of certain goods was exceptionally small the State laid claim to the whole, and a system of rationing was sometimes carried out by Raw Material Associations, formed by the manufacturers and craftsmen who were in need of them. In 1916 steps had to be taken in regard to regulations for the sale of

lubricants, iron pyrites, German iron, and hides, skins and printing paper. The first article to be appropriated by the State was linseed oil, next came hemp and india-rubber. In 1917 hides and skins were appropriated, as well as lubricants, leather shoe-soles, several metals, rails, paraffin, etc. Tickets for the purchasing of benzine for motor-cars and motor-boats were provided through the agency of the Industry Commission. All fat from the bones of mammals and all offal, etc., were turned to scientific or technical account. The use of carbide lamps increased swiftly, as carbide is a Swedish product. The Swedish iron-works and factories were constrained to supply iron goods at reduced prices to cultivators of the soil. In April 1918 rationing of wool began, as well as of cotton yarn, woollen or cotton stockings and woollen or cotton textiles and underclothing of these materials. Purchasing cards were supplied only where the need of them was genuine and "controlled." In Nov. 1918 the rationing ceased.

There was actually no very serious unemployment during the war. A great number of men who lost their work in the building and textile industries were employed in wood-cutting, clearance work in the forests, executing orders for supplies of stone for the communes, etc.

**High Cost of Living.**—High prices were the combined result of scarcity and the inflation of paper money. The prices of goods rose higher than in Great Britain, for example. Official investigations show that if a family which had an income of 2,000 kr. in 1914 sought to keep up the same kind of living its expenditure would have been increased to something over 3,000 kr. a year according to the prices which prevailed in May 1917, and to over 4,800 kr. according to those which prevailed in Oct. 1918. Wages had to be raised considerably. The State granted war bonuses which amounted in all to a sum total of 100,000,000 kr. a year. The State and the communes expended large sums also in subsidies. From Dec. 1916 down to the middle of 1920 the sum of 112,500,000 kr. was used for lowering the prices of food, clothes and fuel and, in some exceptional cases, rent, for the poorer classes. Of this amount the State provided 77,000,000 kr. During the first half of 1918 389,000 families, or 1,344,000 persons, benefited by purchasing goods at these lowered prices. The building industry was at a standstill almost entirely. The State took steps to help it but without much success.

**Changes of Government.**—At the beginning of the war all the burning questions of internal politics were put on one side, and all efforts were concentrated on solving the problems presented by the new condition of affairs. In the autumn of 1914 the new elections for the Second Chamber took place. The party of the Right remained unchanged in numbers, 86, the Liberals numbered 57 and the Social Democrats 87. Dissatisfaction with Herr Hammarskjöld's Ministry increased gradually, the Government—as always happens—being held to blame for the hardships of the times. The Opposition contended that the ministers showed a lack of diplomacy in their negotiations with Great Britain and that they had not paid due regard to the opinions of the Riksdag—certainly the co-operation between the Government and the Riksdag was not what it might have been. In March 1917 the Ministry resigned. In an address with 600,000 signatures Herr Hammarskjöld and his colleagues were urged to continue in office, but they persisted in their desire to withdraw. Herr Carl Swartz, who previously had been Financial Minister, formed the new Government, which was Moderate Conservative in character.

The Swartz Ministry, in which Adml. Arvid Lindman was again Foreign Minister, lasted only into the autumn. From the start it had borne the stamp of a stop-gap Ministry, inasmuch as the new elections were to be held in September. These went against the Right because, among other reasons, the prevailing hardships and the various measures of State interference were laid to their blame. The Right polled 59, the Liberals 62, the Social Democrats 86, while two new parties, the "Böndeförbund"—a league of farmers and countryfolk—and the Socialists of the Left came in with 12 and 11 respectively. The Ministry resigned and the King tried to arrange for a Coalition Government representing all parties. This effort proving un-

successful, the Liberal leader, Prof. Nils Eden, undertook the task of forming a Liberal-Social-Democratic Government. The prime minister himself, the Foreign Secretary, Herr J. Hellner, and five other members of the Government were Liberals; Herr Hjalmar Branting, the leader of the Social-Democratic party, was for a short time Finance Minister; Baron Erik Palmstierna, a former naval officer and a Social-Democratic member of the Riksdag, was Minister of Marine; there were two other Social-Democratic members of the Government, which adopted a Liberal-Radical programme.

**After the War.**—The Riksdag of 1918 passed, among their legislation, a new Poor Law and a new Education Law, reflecting the increased influence of the wage-earners. The wind of reform blew more and more strongly in the autumn. An extraordinary meeting of the Riksdag was called and very noteworthy decisions were come to, which were ratified by the Riksdags of 1919 and 1921, involving (see under *Constitution*, above) an immense democratizing of the administration. The consequences for the First Chamber showed themselves at once, when the Government dissolved it in the autumn of 1919 and the new election took place. The chamber had been made up of 86 Conservatives, 43 Liberals, 19 Social Democrats and two Socialists of the Left. This was now altered to 38 Conservatives, 40 Liberals, 19 members of the "Böndeförbund," 49 Social Democrats and four Socialists of the Left. The greatest novelty lay in the women's vote and in their eligibility for both chambers of the Riksdag.

After the termination of the war in Nov. 1918 the emergency measures were almost entirely abandoned. The regulation of the bacon-and-pork-selling business ceased in Jan. 1919 and the rationing of potatoes in May. In Aug. bread-cards disappeared and the rationing of sugar also stopped on Aug. 1. Most of the industrial regulations came to an end during the first quarter of 1919. The Fuel Commission administration of the rationing of fuel terminated on March 1 of the same year. With the close of May the War Insurance Commission ceased its operation. The Riksdags of 1920 and 1921 renewed in modified form some of the emergency laws, but at the end of the first half of 1920 all that remained of the various Commissions were some small committees of liquidation.

When the League of Nations was still in process of formation the Governments of Sweden, Denmark and Norway appointed committees for the purpose of considering together their attitude towards it. The Swedish Government laid its proposal to join the League before the Riksdag of 1920. Opinions were divided: the decision was given in favour of accession by 86 votes against 47 in the First Chamber and by 152 against 67 in the Second. The Riksdag incorporated in this decision an expression of approval of the basic principles of the League, but formulated also its conviction that the Government should avail itself of every opportunity for urging that the States not invited at first to join the League should be incorporated in it as soon as possible; that a more satisfactory arrangement should be come to for the representation in it of the smaller States; that more definite rules should be framed for the meetings of delegates and for their methods of work; that the standing international tribunal should be constituted as soon as possible, and that its procedure in regard to mediation and arbitration should be more clearly defined and further elaborated; and also that efforts to bring about a universal and effective reduction of armaments should be set on foot without delay and vigorously pursued.

Sweden was represented at the International Labour Conference in Washington in 1919 and at that in Genoa in 1920, as well as at the League of Nations' first meeting at Geneva in 1920, when the Swedish delegates acted on the lines indicated in the Riksdag's utterance. In May 1921 the question between Sweden and Finland as to the sovereignty over the Åland Islands was settled by the League of Nations in favour of Finland (see *ÅLAND ISLANDS*).

Sweden did not formally recognize the Soviet Government in Russia, but at first a Russian representative was allowed to reside in Sweden to maintain the *de facto* relations between the two countries. In Jan. 1919 he was obliged to leave (but not until

Swedish residents in Russia had been enabled to return home) because of oppressive conduct in Russia towards Swedes and in regard to Swedish property. All trade relations were for a time broken off, but to an enquiry from the Allied Powers as to whether Sweden would take part in a blockade of Russia a reply in the negative was given. In 1920 permission was accorded to a Russian trade delegation to visit Stockholm. From the Russian side large orders for railway engines were placed with Swedish manufacturers, and much Russian gold passed through Sweden, mostly destined for America.

*The Eight-Hour Day.*—Within the ranks of the Eden Ministry there was from the beginning a fundamental divergence of view between the Liberals and the Social Democrats, but for some time it was possible for them to work together. Moreover, this Ministry was the only one for a long time past which had a genuine majority, though a very heterogeneous one, in the Riksdag. The most important measure introduced in 1919 was for a legalized eight-hour day, but when first proposed it was rejected by the First Chamber. The Government dissolved the Chamber, and after the new elections an extraordinary autumn session was called at which the eight-hour day proposal was accepted. The Right had retained only 38 seats, the Bondeförbund coming back with 19, the Liberals with 41, the Social Democrats with 49, and the Socialists of the Left with three. According to this law, which was to hold good provisionally until the end of 1923, 48 hours in the week constitute work-time in industrial and other businesses in which at least four employees work at an employer's expense, agricultural work and forestry work excepted. As a general rule over-time must not be instituted to a greater degree than 150 hours in the year. A newly founded institution, the Labour Council, decides questions concerned with the carrying out of the law. A number of flaws were soon discernible in the law, and in the Riksdag of 1920 this Council applied to the Government to effect certain improvements. A proposal was laid before the Riksdag of 1921 and was in the main accepted. The modifications left the main principles of the law unchanged. Sweden subsequently declined to ratify the draft of the Washington Convention of the League of Nations on hours of labour, partly because it conflicted with the Swedish measure already passed, and partly because adhesion would be binding for 11 years, while the Swedish law held good provisionally for a shorter period.

*The Social-Democratic Ministry.*—It was over the communal taxation question that the Eden Ministry went to pieces. This question had for a long period been under discussion, and it was intended to submit some proposal in connexion with it to the Riksdag of 1920. The Social-Democratic members of the Government asked for a definite settlement, while the Liberals wanted only a provisional solution. The end was that the entire Ministry resigned, and that the King invited the Social-Democratic leader, Herr Branting, to form a new Government. In March 1920 he did so. Baron E. Palmstierna, formerly Minister of Marine, became Minister of Foreign Affairs. All the ministers were Social Democrats. The new Government could only count on minorities in both Chambers as a regular Ministerial party. The discussion of the communal taxation question ended in a victory for the Liberal standpoint, a provisional arrangement. In the meantime the Ministry awaited the result of the general elections to the Second Chamber in the autumn of 1920. A comprehensive programme was put forward by means of commissions of inquiry into projects of socialization, industrial democracy, and the control of trusts and other great combinations.

*Change of Ministry.*—Dissatisfaction with the eight-hour day and with the socialistic projects brought a good many electors over to the party of the Right. The strength of the Social-Democratic party in the Second Chamber went down from 86 to 75, and the number of the Liberals was reduced from 62 to 47, while that of the Right went up from 59 to 70 and of the Bondeförbund from 10 to 29. The Socialists of the Left were reduced from 11 to 7, a result of their sympathies with the Russian Communists. Two members of the Chamber were "independents." The more than usually complex party conditions led the King to invite Baron Louis de Geer to form a non-political Ministry. Count

Herman Wrangel quitted the post of Swedish minister in London, in which he was succeeded by Baron Palmstierna, to become Minister of Foreign Affairs. The new Government began at once to occupy itself seriously with industrial, commercial and financial matters. Among other bills which it put before the Riksdag of 1921 was one for increasing the duty on coffee. On this being rejected Herr Tamm, the Finance Minister, resigned, and the prime minister, too, then resigned. He was succeeded by Herr Oscar von Sydow, former Minister of the Interior.

*The Economic Crisis of 1920-1.*—During the latter half of 1920 Sweden had entered on a grave economic crisis—her share of the general economic difficulties which prevailed after the war. The period from the dissolution of the union with Norway in 1905 down to 1914 has been characterized as one of great economic development. During and after the war cost of production rose swiftly, not least because the workmen, after the passing of the Eight-Hour Day Act, in most cases obtained higher rates of wages so that they could earn as much as when working longer hours. Compensation had already been allowed them for the increase in prices. As soon as importation possibilities became increased after the war, goods began to be imported to an extravagant degree, so that the country became flooded with them to the detriment of home industries. Finally the Swedish exchange, which stood somewhat higher outside than inside the country, facilitated importation but hindered exportation. When the international crisis came, with its swift fall in prices, it became necessary to lower wages again, but this brought the country up against great difficulties. In April 1921 about 60,000 industrial workmen were unemployed; in June about 90,000.

*The Swedish Red Cross.*—Some account of the activities of the Swedish Red Cross must have its place in an outline of Swedish history during and after the war. King Gustav's brother, Prince Carl, played a leading role in this connexion, and also the Crown Princess Margaret (daughter of the Duke of Connaught), whose death in 1920 was sincerely mourned. The work of the Swedish Red Cross was directed more particularly to relieving prisoners of war in the various countries, above all in Russia on the one side and Germany and Austria-Hungary on the other. During 1915-8 a great number of invalided prisoners, including 3,617 Germans, 22,123 Austro-Hungarians, 428 Turks and 37,295 Russians, were brought homeward through Sweden by means of the Swedish Red Cross, specially equipped trains travelling between the Swedish-Finnish frontier in the north and Trälleborg in the south. Across Sweden, moreover, there went a stream of parcels by post, in both directions, for prisoners. The Swedish postal service dealt with 12,700,000 parcels of this kind. The Crown Princess was specially interested in collecting books to despatch to the prisoners' camps. Important work was also done in the inspecting of the prisoners' camps in Russia, Germany and Austria-Hungary. Delegates distributed gifts from home among the prisoners: 1,016 railway waggons packed with such gifts passed through Petrograd *en route* eastwards, and from Russia 1,012 travelled into Germany and 304 into Austria-Hungary. The delegates drew attention to various shortcomings in the German camps and in most cases this resulted in improvements being effected. The conditions in Russia and Siberia were found to be much worse. Delegates' records of what they saw revealed a terrible condition of things in many camps. In some there were 30 deaths a day among the prisoners. Under the guidance of the Swedish delegates new hospitals were established in many places or old hospitals improved, kitchens and baking-rooms being constructed, drains put into order, and large stores of medicines and bandages, etc., being supplied. In Jekaterinburg, for instance, the authorities threw all care for the prisoners entirely on the Swedish delegates within a region of 1,200 sq. miles. Thirty-three hospital buildings were erected in this region, and at some periods a Swedish Red Cross Kitchen established there was able to distribute food to 1,200 men a day. This work was attended with risks. Two delegates were murdered and several died in hospitals for infectious cases. During the Finnish civil war two ambulances were sent to Finland in 1920, and one ambulance was sent to Poland to help in coping with the epidemic there.

The grave privations in many countries after the war due to the scarcity of food aroused deep sympathy in Sweden. Among other steps taken to afford help may be mentioned the welcoming of 20,000 children from Germany and Austria (and in some degree from the Baltic Provinces) to stay in Swedish homes with a view to their regaining health and strength. The homes of both the well-to-do and the poor were thrown open for this. The total amount of money devoted to such acts of helpfulness (including the cost of the children's visits) is estimated at more than 25,000,000 kr., of which the State was responsible for 1,500,000 and the rest was collected by private subscriptions. A detailed report was laid before the International Red Cross Conference in Geneva in 1921. (K. H.\*)

**SWEET, HENRY** (1845–1912), English philologist, was born in London Sept. 15 1845. Educated at King's College, London, Balliol College, Oxford, and Heidelberg University, he was a recognized authority on the subject of phonetics (see 21.460–61; 9.597), and a readership in phonetics was specially created for him in 1901 by the university of Oxford. His published works include an *Anglo-Saxon Reader*, a *Student's Dictionary of Anglo-Saxon*; an *English Grammar*; *The History of Language*, and many editions of Old and Middle English Texts. He died at Oxford April 30 1912.

**SWETE, HENRY BARCLAY** (1835–1917), English theologian, was born at Bristol March 14 1835. He was educated at King's College, London, and Caius College, Cambridge, and in 1858 was ordained. After some years of work in various country curacies and livings he became in 1869 theological lecturer and tutor at Caius College. In 1881 he became examining chaplain to the Bishop of St. Albans, and the following year was appointed professor of pastoral theology at King's College, London. In 1890 he succeeded Westcott as regius professor of divinity at Cambridge, and retained this position until 1915, when he retired with the title of emeritus professor. He was in 1911 appointed an hon. chaplain to the King. Swete's works on Biblical texts are of the highest importance. In 1887 he published the first volume of his edition of the Greek text of the Old Testament, completing the series in 1894 (3rd ed. 1901–7), while in 1898 appeared the Greek text of the Gospel of St. Mark, with notes and introduction (2nd ed. 1902) and in 1906 that of the Apocalypse of St. John (2nd ed. 1907). He was the editor of *Cambridge Theological Essays* (1905) and *Cambridge Biblical Essays* (1909), and was a contributor to Smith and Wace's *Dictionary of Christian Biography* (1882–87) and Hastings's *Dictionary of the Bible* (1899–1900). He also produced many historical and critical works, including *The Apostles' Creed in Relation to Primitive Christianity* (1894; 3rd ed. 1899); *Church Services and Service Books before the Reformation* (1896); *Patriotic Study* (1902); *The Appearances of Our Lord after the Passion* (1907; 2nd ed. 1908), and *The Last Discourse and Prayer of Our Lord* (1913). He died at Hitchin May 10 1917.

**SWIMMING:** see SPORTS AND GAMES.

**SWINFEN, CHARLES SWINFEN EADY, 1ST BARON** (1851–1919), English lawyer and master of the rolls, was born at Chertsey, Surrey, July 31 1851. He was educated privately, and in 1874 was admitted a solicitor, but in 1879 he was called to the bar, having been during his period as a student a pupil of Cozens-Hardy. In 1893 he became a Q.C., and in 1901 was raised to the bench of the Chancery division and knighted. In 1913 he became a lord justice of appeal, and in 1918 master of the rolls in succession to Lord Cozens-Hardy. He retired in 1919 and was raised to the peerage only a few weeks before he died in London Nov. 15 1919.

**SWITZERLAND** (see 26.238).—Before dealing with the affairs of Switzerland during 1909–21, a note may be made on a curious theory recently put forth, especially in Romance Switzerland, that the Swiss Confederation is “the oldest republic or democracy in the world.” Now certainly a “king” has never ruled in Switzerland (save in the case of Neuchâtel before 1857), nor since 1648 has any emperor ever had any claim on the allegiance of the Swiss. But then we must recollect that till 1798 Switzerland never had a single head, whatever he might be entitled. If we take the term “republic” to mean a “democratic Government,” it is quite true that there were (and are) “republics” of that kind in various regions of Switzerland (e.g. Schwyz), but what is true of a part is not true of the whole. Again, before 1798 there was no Central Government at all in Switzerland, while it was only in 1848 that it first possessed a “President” (with very limited powers). But there was a president already in 1787 in the United States of America, while the “free communities” or “republics” of Andorra (in the Pyrenees) and of San Marino (Italy) are far older than any such in Switzerland. Naturally the use of the word “*Republik*” by certain cantons before 1798 (e.g. the “*Stadt und Republik Zürich*”) referred to the rural districts of each, and these by no means enjoyed “democratic government”

at the hands of their respective towns. The fact that in 1848 the first “democratic Swiss Constitution” (still in force so far as regards the practical details relating to the Central Government) was avowedly based on that of the American republic is sufficient to disprove the quaint theory that Switzerland is the (in any sense) “oldest Republic in the world.” The reverse is really more nearly the case. In neither of the two ordinary senses of “republic” is this theory even approximately accurate.

**Population.**—As regards resident population, the results of the last two Swiss censuses, Dec. 1 1910, and Dec. 1 1920 (only the provisional results, published in Feb. 1921), were as follows:—

	1910	1920
Total . . . . .	3,753,293	3,861,508
<i>Languages</i>		
German . . . . .	2,594,298	..1
French . . . . .	793,264	..1
Italian . . . . .	302,578	..1
Romansch . . . . .	40,122	..1
Other languages . . . . .	23,031	
<i>Religions</i>		
Protestants . . . . .	2,107,814	2,218,589
Roman Catholics . . . . .	1,593,538	1,586,826
Jews . . . . .	18,463	20,955

<sup>1</sup> Figures not published up to Jan. 1 1922.

The decrease in the number of the Roman Catholics is mainly due to the fact that in 1910 the “Christian Catholics” (Old Catholics) were reckoned among them, whereas in 1920, for the first time, they were counted separately, the number given, however (56,250), being greatly exaggerated, since in Tessin (where there is none of this sect) many Roman Catholics described themselves as such under some error. It is noteworthy that the Jews were in 1850 only 3,145 in number, but in 1910 already 18,463, and in 1920 20,955.

In five cantons the population has diminished (Outer Rhodes of Appenzell, St. Gall, Tessin, Vaud and Neuchâtel). In recent years there has been much fear expressed in Switzerland that the non-Swiss were increasing too rapidly for the welfare of the land. This no doubt was due to the vast immigration of German, French, and Italian workmen, who asked lower wages than the Swiss, and, when settled down, became exempt from military service in their native land. During the World War many returned home, and so the figures are not so alarming as was feared at one time. Here is a complete list:—

1860	114,983,	of which 1,202 were British subjects;
1870	150,907	(British subjects 2,297)
1880	211,035	(British subjects 2,812)
1888	229,650	(British subjects 2,577)
1900	383,424	(British subjects 3,535)
1910	552,011	(British subjects 4,118)
1920	410,983	(British subjects, figures not available).

Thus the percentage rose from 57 per thousand in 1860 to 79 in 1888, and to 116 in 1910, the culminating point being reached in 1900 with 147, so that the 1920 figures of 106 show a distinct decrease, largely due, like the diminution of the Roman Catholics, to the greater number of French citizens who have gone from Geneva back to France. In 1920 the 12 most populous towns in Switzerland (number of residents) were: Zürich, 205,892 (190,733 in 1910); Geneva, 138,034 (123,153 in 1910); Basle, 135,134 (132,276 in 1910); Berne, 103,990 (90,937 in 1910); St. Gall, 69,651 (75,482 in 1910); Lausanne, 67,852 (64,446 in 1910); Lucerne, 43,696 (39,339 in 1910); La Chaux de Fonds, 37,591 (37,751 in 1910); Winterthur, enlarged, 49,491 (46,384 in 1910); Bienne, enlarged, 34,414 (32,401 in 1910); Neuchâtel, 22,951 (23,741 in 1910); and Fribourg, 20,468 (20,293 in 1910). No other Swiss town has a population attaining 20,000, though Schaffhausen is not far off with 19,930 (18,101 in 1910). There are also 14 Swiss towns with populations below 20,000, but over 10,000. The increase in the case of Berne is due to its absorption of the suburb Bümpliz, etc., and in the case of Bienne to increased prosperity, while the decrease in the cases of St. Gall, of La Chaux de Fonds and of Winterthur are to be accounted for by industrial depression, and the departure of many workmen.

As the “Concil National” is elected in the ratio of one member for 20,000 of the total population or fraction surpassing 10,000, the new census will increase its members by eight, so that henceforth it will have 197 members.

**Politics.**—The members of the Swiss Federal Executive (*Bundesrat*) were almost all changed in the period 1910–20, so that in 1921 the seniors were G. Motta (first elected in 1911), and E. Schulthess (first elected in 1912). The five other actual members had all entered the Council since 1917—R. Haab in 1918, Karl Schueer, E. Chuard, and J. Musy, all in 1919, and H. Häberlin in 1920. E. Chuard was the oldest in years (b. 1857), while J. Musy was born in 1876. Thus the Council had been

greatly rejuvenated. Six members were Radicals, Signor Motta being the only Conservative and Roman Catholic.

The recent presidents of the Swiss Confederation (little more than the chairmen of the Federal Executive) have been A. Deucher (1909); R. Comtesse (1910); M. Ruchet (1911); L. Forrer (1912); E. Müller (1913); A. Hoffmann, (1914); G. Motta (1915); C. Decoppet (1916); E. Schulthess (1917); F. L. Calonder (1918); G. Ador (1919), and G. Motta (1920); while the president for 1921, E. Schulthess, would in 1922 be succeeded by the vice-president, R. Haab. Of late years the Political Department (i.e. the Ministry of Foreign Affairs) has become specially important. A resolution of the Federal Executive in 1917 decided that this important department should *ipso facto* be attributed to the president. But, as the president changes annually, this plan was soon found very inconvenient, and so in 1920 a return was made to the older system that each councillor should retain the department assigned to him. Hence G. Motta would be Foreign Minister till Jan. 1 1923, when the date of fresh election came round again.

The Swiss people adopted by a popular vote the principle of proportional representation for elections to the "Conseil National" in Oct. 1919. But though it was expected that the Socialists would win many more seats they only won much fewer. The Radical majority was reduced from 102 to 60, in the Assembly of 189 members, thus losing its absolute majority over all other parties combined, but retaining the strongest single group. Forty-one Socialists (in 1917 but 19) and as many Conservatives were elected, and the new "Citizens and Peasants" party (a split from the Radical party) obtained 28 seats.

Proportional representation was also winning its way in the cantons, Aargau and Fribourg adopting it in 1920, followed in 1921 by Berne and the Valais. Thus 18 of the 22 cantons approved it. Indeed in 1920 the canton of Fribourg, hitherto reckoned one of the most backward as to the recognition of popular institutions, made a great advance, accepting in one day the facultative referendum, the initiative, the election of the Executive by the people, and that of the Legislature by proportional representation. A number of Federal votes have been taken in recent years. The constitutional amendments related to infectious diseases (1913), the creation of an administrative court (1914), the levy of a war tax (1915), the imposition of a stamp tax on certain business papers (1917), regulations as to waterways (1918), a renewed war tax (1918), entry of Switzerland into the League of Nations (1920), and regulations as to hours of work (1920). A law (facultative referendum) as to sick insurance was also accepted in 1912. But of the "Initiatives" two were rejected (proportional representation in 1910—accepted, however, in 1918), and a Federal tax in 1918, but in 1919 the detailed regulations as to the working of proportional representation in the "Conseil National," and a law abolishing gaming houses were accepted. Of four later votes, all in 1921, those relating to popular approval of international treaties of a certain length, and new regulations as to motor-cars and to aviation were accepted, but a fourth relating to military courts of justice was rejected.

At the very beginning of the World War (Aug. 3 1914) the Federal Parliament handed over to the Federal Executive certain extraordinary (emergency) powers of acting, and these powers, excluding all obligatory popular votes were found to be very convenient by the Federal Executive.

The entry of Switzerland into the League of Nations was accepted by a popular vote on May 16 1920, the majority in favour (mainly from the French-speaking cantons) being 97,051 votes and by 11½ to 10½ cantons. But in Feb. 1921 the Federal Executive declined to allow the passage through Switzerland of troops, raised to act as police in the case of the Vilna plebiscite.

Some of the members of the former Austrian Empire have sought a nearer connexion with Switzerland. Liechtenstein was indeed admitted into the Swiss postal, telegraph, and telephone system. But the Vorarlberg (and for similar reasons the Tirol) had not up to Aug. 1921 succeeded in being admitted as Swiss cantons, there being great fear felt in Switzerland of increasing the German-speaking population, and particularly of augmenting the number of strict Roman Catholics.

**Finance.**—The finances of the Swiss Confederation were in 1921 (so said M. Musy, the Swiss Finance Minister) in a difficult position. Their backbone, in the matter of receipts, even in the pre-war period, was the amount of the customs' duties. But even at that period these produced less than heretofore. The last year when they showed an increase was in 1912 (£3,500,000). After that time the decline was pretty steady, and the deficits higher and higher. It has been estimated that, while in 1913 they sufficed to defray about 84% of the total expenses of the State, in 1919 the amount met only 28% of these expenses (in 1913 £3,360,000, and in 1919 only £2,520,000). And these expenses steadily increased after the outbreak of the war, though, of course, Switzerland was not one of the belligerent Powers. The deficits since 1914 are as follows:—1914, £901,000; 1915, £862,000; 1916, £665,000; 1917, £2,000,000; 1919, £2,475,000, and 1920, £3,980,000—in 1920 the receipts were £13,740,000, and the expenses £17,720,000. Despite the formal assurances of neutrality received from the principal combatants, the War Minister of Switzerland thought it essential to guard all its frontiers with a strong military force, and to erect costly new fortifications (as at Morat), so that at the end of 1920 the total "mobilization expenses" amounted to no less than £47,500,000, while the military expenses in the accounts for 1921 were £2,880,000, and that only an estimate far inferior to the demands of the military authorities. Large loans (nine in number, to the total amount of some £31,200,000) have been contracted, but on these heavy interest has to be paid. Exchequer bills for two to five years at 6% were also issued in order to assure the supply of necessities of life. Special taxes were imposed, first a war tax (which produced £4,400,000), then a tax on war profits (which produced £11,120,000), next a "renewed" war tax (to last 16 years). The increased salaries and wages of the army of federal officials (including the railwaymen) were a further burden, and, naturally, as the cost of living increased, there came a fresh rise of salaries and wages to meet it—a vicious circle. Even the telegraph and telephone rates had to be raised, not to speak of the postal charges, so that while formerly a letter within Switzerland cost only 1d. it cost 2d. in 1921 and a post card 1d. in lieu of ½d. The charges on foreign correspondence have also been raised, so far as regards the transit from Switzerland to the outer world, for a letter from 2½d. to 4d., and for a post card from 1d. to 2½d. As Switzerland produces very little in the way of raw materials, such as coal, these had to be bought at high prices, a fact which further raised the cost of travelling, hotel prices, and of all articles of home consumption. The only persons who have not felt these raised prices are the self-sufficing (or nearly so) peasants, who, in some cases, have even made large profits by the sale of their milk, cheese, butter, etc. Naturally the towns felt this rise to an extraordinary extent, and great distress and lack of employment resulted. The only cheering symptom, from the Swiss point of view, was that the currency exchange was almost everywhere favourable to Switzerland, save as regards American money. An attempt has been made (Feb. 1921) to raise provisionally certain customs duties but at Protectionist rates, so that the interests of the consumers are being sacrificed to those of certain trades, as well as (also provisionally) to limit imports to a certain extent. In 1912 the customs duties amounted to 6% of the value of the goods imported, but in 1920 not even to 3 per cent.

Hence the deficit in the Federal budget for 1921 was put at five or six million pounds, a huge amount for a country with under four million inhabitants. If the Federal finances were in this state, the cantonal and communal finances were no better.

It must be borne in mind that the direct taxes are paid by a very small minority of Swiss. In the case of the direct taxes the total amount, from 1914 to 1920, was about £70,000,000, while the indirect taxes only brought in some £18,000,000.

Switzerland is still predominantly an agricultural country, so that the majority of voters are peasants, with very narrow views. The industrial population is very much weaker politically, and is regarded with great disfavour by the Agrarian party, which desires, for its own objects, to set up a "Chinese wall" round Switzerland. But the land must have other manufactures than chocolate, condensed milk, cheese, etc., and thus must import much which has to be paid naturally by its exports. Yet the narrow "Cantonal spirit" is still widely diffused in Switzerland.

The annual deficits on the Swiss State railways are especially great. It was officially reckoned that in 1918 the total Federal debt had attained a height of about £33 per head of the population, whereas in 1912 it had only been £17.

**Army.**—Formerly detailed annual accounts as to the Swiss army (a purely militia force) were published. But since the outbreak of the war these accounts have no longer been issued. But an indiscretion of the semi-official Bernese newspaper, the *Bund* of Berne (June 23 1920), tells us that in June 1920 the numbers were 337,282, of whom 71,993 formed the "second reserve," the rest falling into the "Auszug" or "Elite" and the "Landwehr." The "Elite" includes the younger men from 20 to 32 and the "Landwehr" or first reserve those between 33 and 40, while the "Landsturm" or reserve proper is composed of men between 41 and 48.

At the beginning of the war Col. Ulrich Wille was elected the "General," while Col. A. T. L. Sprecher von Bernegg became chief

of the staff. It was thought necessary to guard all the Swiss frontiers, a policy which cost £47,500,000, and disorganized industry and agriculture to a very great extent. The German-speaking troops were sent, as far as possible to the Jura or the French-speaking or the Italian-speaking regions, while the French-speaking soldiers looked after the German-speaking districts. The object was to prevent any fraternization with the troops of the belligerents. Much inconvenience was caused by this mobilization. The military organization was tightened up on the lines of the German army, and this greatly bothered the free Swiss citizens.

Naturally the military budget increased greatly, amounting in 1921 to £3,000,000, though this represented a reduction of about £250,000 on the demands of the military authorities. This great increase is to be explained in part, at least, by the increased cost of material. In 1910 the annual cost amounted only to £1,680,000.

*Agriculture, Commerce and Railways.*—Censuses of cattle have been frequently made. In 1866 there were 553,205 cows, in 1886 663,102, in 1906 785,950, in 1911 796,909, in 1916 849,011, but in 1919 738,896 and in 1920 only 729,999. The great fall in the numbers is commonly attributed to the huge purchases of milch cows made during the war by Austrian and Hungarian cattle dealers, for export to Germany. Hence came a milk famine, and milk had to be "rationed." Potatoes and other such produce were also rationed and each householder had to plant them on his land, however unsuited for this kind of cultivation.

In 1920 foot-and-mouth disease raged furiously in all parts of Switzerland, and even intercourse between neighbouring valleys was forbidden in order to try to stop the spread of the infection.

During the war certain branches of Swiss commerce flourished much, for, against the wishes and instructions of the authorities, there was much smuggling of all kinds of goods over the frontier, especially towards Germany and France, which, naturally enough, are Switzerland's best customers. The imports were often less than the exports. But in 1915 they were nearly equal in money value, the imports being slightly more than the exports. However, in 1916, the reverse was the case, the exports being £99,000,000, and the imports £93,000,000, but in 1917 the imports had again the best of it. In 1918 the imports amounted to about £96,000,000, and the exports to about £78,000,000. (Great Britain ranked third in each case.) In 1919 the exports amounted to £136,000,000, the highest figure ever attained, and the imports to £143,000,000. But in 1920 the imports rose to the prodigious figure of £169,000,000, while the exports dropped to £131,000,000.

As coal is practically non-existent in Switzerland it must be imported, naturally at considerable cost. Hence the imported supply had to be strictly "rationed" during the war, and the price increased enormously, especially in the case of domestic consumption. Of course, the factories suffered much, and the railways even more. Hence the electrification of the latter was pushed on as quickly as possible. But it was not possible to do this all at once, and so one saw locomotives driven by means of logs of wood. The number of trains was reduced, at one time very much indeed, and the fares pushed up to a great degree, which much hindered communications, even within the country. The first electrically-driven train went through the St. Gotthard tunnel early in 1921. The Lötschberg railway was opened in 1914, just before the outbreak of the war, and thus its prosperity was greatly let and hindered, while on the Valais slope, above Brieg, the unstable nature of the ground has caused many landslips, and thus entailed many costly repairs. But the great scheme for connecting the two stations in Geneva has been indefinitely postponed, owing to its excessive cost.

*Social.*—In 1912 a vast scheme of insurance against sickness and accidents was accepted on a popular vote. But up to 1921 money was lacking to put it into operation, even though unsuccessful attempts had been made to "earmark" certain items of the revenue.

As everywhere else in Europe the unemployment problem was troublesome in Switzerland. The militia employed in the great mobilization came home, unused to work as before, while work was scarce owing to the lack of money, the higher cost of living, and the rise in the salaries and wages of nearly all classes. Naturally this state of employment was felt most in and near the great Swiss towns. And here came in a fresh complication—the lack of dwelling houses and flats. This was, in part, due to the rush from the country to the towns, and the crisis became very acute, so that in Berne, at least, all foreigners were ordered out of the town, so as to procure lodgings for Swiss workmen. In the rural districts neither unemployment nor lack of dwelling houses was felt to anything like the same degree, though, no doubt, they existed to a certain extent. But these rural regions are inhabited by peasants who do not easily move from their homes, and are occupied in the cultivation of their small bits of land. As in Switzerland there are few persons of means independent of a trade or a profession, the disturbance in social life was very great, while the high taxes and high wages limited the power of employing labour.

*Ecclesiastical.*—There were several welcome symptoms of the cessation of the "Kulturkampf," or religious strife following on the decrees of the Vatican Council. On Sept. 1, 1920, a papal nuncio for Switzerland was named, for the first time since 1873, in the person of Monsignor Luigi Maglione, titular archbishop of Caesarea.

He was already favourably known in Switzerland by reason of his love for that country, and his devotion in the case of prisoners of war and sick children. In Feb. 1921, the canton of Berne at last resumed its full legal responsibility for the reconstituted diocese of Basle, after holding aloof for many years, and thus recognized the bishop as spiritual head of the diocese, thus allowing him full liberty of exercising his functions within the canton for an unlimited period (and no longer for five or ten years, as heretofore). Again, in the census of 1920 the "Christian Catholics" (the Swiss "Old Catholics," who previously had been included among the Roman Catholics) were numbered apart, though by reason of some error in the case of the canton of Tessin their number was put at 56,250; the real number is believed not to exceed 35,000 to 40,000.

On the other hand the Pope laid claim to the direct nomination of the bishop of Sion in the Valais.

The new census has put an end to the topsy-turvy fact that in the canton of Geneva the Roman Catholics outnumbered the Protestants—so many French Roman Catholics have returned to France that the balance has been reversed.

Mention may be made of the fact that, in 1910, in the canton of Basle, the separation of Church and State was carried out, while in the same year women obtained the right of voting in the disestablished Protestant church of Geneva.

In the summer of 1920 reunion conferences were held both at Beatenberg and in Geneva, but almost wholly between various Protestant denominations.

*The World War Period.*—During the fateful days immediately before the war broke out in 1914, the uncertainty whether there would really be war or whether commonsense would prevail kept the whole of Switzerland in a state of feverish anxiety, and when the loaded dice fell, very many persons in Switzerland were seized with panic. A wild assault was made on all provision establishments which supplied the necessities of life, and these were bought in mad fashion and in quantities far above what was required. In many families stores of eatables were still found after the lapse of two years, and that quite apart from what had been spoilt. The banks and other establishments of a like kind had to withstand a regular siege, for everyone desired to get his property back. This haste had finally to be restrained by orders issued by the Government. As if by enchantment coins of small denominations disappeared from circulation. Not even at the post-offices was it possible to change Swiss banknotes for large sums. It was especially hard on the foreign tourists who were surprised by this sudden war. No one was any longer willing to change their foreign banknotes and cheques, formerly cashed so eagerly. Only the hotel keepers found themselves forced to receive cheques in payment for their accounts, and that despite the danger of incurring great losses by this act of friendship.

On the Swiss frontiers the blocking of all communications took strange forms. A typical case was that of Basle, close to the northern frontier. The tourists rushed in by thousands, and the railway trains were enormously delayed. With the keenest anxiety everyone sought for a carriage, a motor car, or some kind of cart so as to reach the frontier as easily and as quickly as possible. Many, whose cash had disappeared in consequence of the difficulties caused by the exchange, had to set out on foot, burdened with their luggage, to cover the great distance. These carts themselves were heavily laden with luggage, trunks and band boxes, while high up on these artificial mountains were perched travellers of every land, who to-day shared their common hard fate peaceably, but on the morrow were to oppose each other as enemies. Here was a German professor clothed in homespun, there an Englishman in tweeds, near by were some merry Belgian ladies with huge hats and elegant parasols, and, on top of all, countless schoolboys with caps of diverse colours. So was it all day long in the town. All this wild confusion was caused by the sudden interruption of international communications and the closing of the frontiers.

Thousands also were deprived of one fell stroke of their daily bread. Such were chiefly Italians, who desired to regain Italy over the St. Gotthard or the Simplon, often with only a little cash, sometimes quite penniless, and who were blockaded in Basle, and in incredible numbers, finally some 40,000 of them. All these unfortunates had to be cared for till it was possible for them to resume their journey. Quarters were found in private villas and other dwelling houses for the sick women and children. The Coöperative Society of Basle sent great carts filled with

bread and milk, private benevolence made gifts of tea and other eatables. School houses and gymnasiums gave shelter to these unhappy, homeless Italians as far as quarters could be found anywhere, but a great number had to camp out in the open. Only when the great rush had somewhat abated was it possible to facilitate their return to their own country.

Side by side with these arrangements military preparations were carried out in Switzerland. On July 31 1914 the entire Swiss army was warned to be ready, and as early as Aug. 1 the order to mobilize was given. The first day for this was Aug. 3, and two days later the mobilization was quite complete. The troops were ordered to the frontiers which till now had been guarded in part by the second reserve (Landsturm), called out first of all. At the same time (Aug. 3) the Swiss Parliament gave the Swiss executive unlimited powers, even in financial matters. Col. Ulrich Wille was named as commander-in-chief, and Col. Sprecher von Bernegg as chief of the general staff. As it was hoped that the war would not last very long, the mobilized troops went off joyfully to the frontiers. The belligerent States solemnly assured Switzerland of their intention of observing its neutrality, a declaration which brought about a certain amount of relief. When finally the principal operations of war were seen to be taking place far from the Swiss frontiers, the Swiss people were able to think of recalling the troops, in order to simplify matters, from the service on the frontiers, though some were later summoned to relieve those actually serving there. But if in Switzerland a sigh of relief arose, the sad fate of Belgium was felt to be a stern warning, and greatly embarrassed the Swiss authorities, military and political, and it was felt to be quite impossible to strip the frontiers of all watching troops. The fact of this monotonous service, and the conviction that the war might possibly last a long time, brought about a certain disinclination for further service of this kind. Besides, such protection of the frontiers threatened to become costly to an appreciable degree. Therefore much criticism was exercised, chiefly by the Socialists, who especially blamed what, from their point of view, were the mainly needless fortifications around Morat, which were regarded as simply a piece of military display and lavishness, and were considered as a partial measure directed against one only of the belligerents. Thus the Swiss authorities had to order certain alleviations and simplifications in this frontier service. In order to satisfy the agricultural interest the peasant soldiers were called out at a period which caused least disturbance in the cultivation of the land, etc.

Among the military war measures must be counted the abolition, from the beginning, of telephonic communications between the different Swiss towns. This caused all the greater rush to the telegraph offices, and yet even these were under the censor, at least so far as regarded foreign countries.

The equipment of the Swiss army in new, field grey, uniforms was carried out in 1915-6. The expense of these new uniforms amounted to about £300,000.

Most unpleasant for Switzerland was the "Affair of the Two Colonels" (Jan. 15 1916), Egli and von Wattenwyl. This pair of Swiss officers were in regular communication with the German and the Austrian military attachés, ostensibly only for supplying such information as affected no Swiss military matters. All the same this "affair" caused great amazement, especially in French-speaking Switzerland, and in the breasts of the Socialists, who saw in this action of two officers of the Swiss general staff an unneutral and unfriendly act as regards the Entente. They were court-martialed, but were acquitted of the charge of infringement of their official duties, and were handed over to the Swiss executive for "disciplinary punishment" because of their conduct against Swiss neutrality. By this they were each sentenced to 20 days' strict arrest, and to suspension as leading officials in the Swiss general staff. Col. Egli demanded his dismissal at once. The Socialists and a delegation of the Government of canton Vaud required the summoning of the Swiss Parliament in order to discuss the "Affair of the Two Colonels."

About the same time the war control of the Swiss railways was abolished, while a census of Swiss who were not liable to do

military service and of arms in private hands was decreed. A later appeal for well-qualified sharpshooters among Swiss citizens resulted in the volunteering of about 100,000 men, of whom, however, only a small percentage was accepted as being really fit for such military service.

Much bad blood was caused in the Socialist camp, and also among other citizens, by the Swiss Government's decision that punishments for certain purely military offences were to be purged in the penal establishments of Witzwil and of Orbe, while in the case of the officers' confinement in the fortresses of St. Maurice and St. Gotthard alone was directed. Complaint was also made of the alleged rigorous treatment of ordinary soldiers, and of the far lighter treatment of officers charged with offences.

All this occasioned the promotion of an "Initiative" for the total abolition of courts of military justice. Enough signatures were obtained for this "Initiative," but it was later defeated on a popular vote.

It is easy to understand that Switzerland was the special rendezvous of foreign spies, especially the frontier towns and even the capital, Berne. In this respect all the belligerents did their very best. So even the former director of the Bernese tourist bureau, for taking part in an intelligence service in favour of a foreign Power, was condemned to five months' imprisonment and a fine of £8.

As early as Nov. 1916, the Swiss executive resolved to recruit 250 volunteers out of the army to serve as army police, and this for the entire duration of the war mobilization.

Certain troops, especially those from industrial regions, had to be pacified by the Swiss Parliament by increased pay. This scheme did not find support as late as the end of the year 1916; but was adopted in April 1918, and then it was not merely the pay which was increased, but also the amount of food rations carried in the knapsacks, and emergency support in case of need (this in the case of soldiers' families).

The fact, too, must not be overlooked that in cases of discontent with the military service many unfortunate events contributed to this dissatisfaction. One example was the accelerated mobilization of the 3rd Division (May 1917), and the following endurance marches in great heat, in consequence of which many soldiers were made ill, and fell exhausted on the roads. This brought about an exceedingly vehement movement against all military service, and was utilized to the utmost by the workmen.

In June 1917 the Swiss Government had raised the amounts of the emergency family grants in the big towns to about 2s. a head per day for grown-up persons, and to 8d. for children, while in the smaller towns the respective amounts were 1s. 6d. and 6d. In the same year the length of the relief services was fixed at 2½ months for the younger and active men (Auszug), and at six weeks for the older men of the first reserve or "Landwehr."

Considerable discontent prevailed in French-speaking Switzerland with the chiefs of the Swiss army, who seemed to it too "Germanophile." This went so far that, in course of the discussion by the Swiss Parliament of a report on Swiss neutrality (Aug. 1917), a formal vote of want of confidence was proposed, and the compulsory retirement of the general and of the chief-of-staff demanded. All such proposals, however, were rejected, but they threw a lurid light on the disagreement between French-Swiss and German-Swiss. In the Assembly, however, the assertion of the supremacy of the civil power over the military power was approved, as was also greater economy in the matter of constructing fortifications, etc.

In consequence of the prolongation of the war, and the frequent calling up as reliefs of soldiers without much means, great distress was inflicted on them and on their families, and many could not find work on being released from active service, as their situations had been filled by Swiss citizens exempt from military service and sometimes even by women. In order to alleviate this crying distress a department for the promotion of the welfare of the soldiers was founded by the Swiss executive which gave this department a first contribution of some £18,000 (Aug. 2 1917). Later on came the "National Collection" (a voluntary contribution made throughout Switzerland), which brought in millions

of francs. To stimulate this collection specially large medals of copper, silver, and gold were struck, and also brooches made, all being sold to the people. The term and the institution "For the welfare of the Soldiers" must be understood to include also other benevolent institutes for the soldiers on active service, such as "Soldiers' Homes," some of which were splendid soldiers' institutes where refreshments were to be had cheaply, and which afforded opportunities for reading and for writing letters. We must not pass over the arrangements made for the washing of the soldiers' garments. Not merely was the soldiers' body-linen washed, but their clothes repaired, and in part replaced.

It would be most unjust to pass over the very prolonged occupation of the Swiss frontiers if we did not mention the exertions of the Swiss Red Cross Society. The Swiss Red Cross is managed usually by a board of directors. But at the very beginning of the mobilization (Aug. 2 1914) the Red Cross men were also called up, and a medical man placed at their head as chief. At that moment the Red Cross had at its disposal not quite £6,000. Hence it was resolved to organize a national collection, not merely for actual money, but also for gifts in kind (especially linen and woollen garments), and this idea was eagerly taken up. The money collected amounted to about £84,000, while the gifts in kind flowed in abundantly. As to the latter the Swiss women displayed great zeal. From all sides poured in shirts, socks, and other things, in huge quantities, including bed-linen and objects for use in hospitals. We must note the quaint fact that, over and above what is commonly used by soldiers on active service, many odd gifts were received, such as chemises for women, articles for female toilettes, and even children's toys.

If detailed figures were to be given for the useful objects collected from Aug. 1914 to June 1918 by the Swiss Red Cross Society, such as body-linen, shirts, sheets for beds, etc., the number would run up to several hundred thousands. The shirts, and the like, were specially welcomed by the poorer soldiers, who otherwise would have fallen victims to various diseases arising from the lack of such things, or in winter-time would have been frozen. For many, military service was thus rendered far more endurable.

One of the chief tasks which fell to the Swiss Red Cross was the creation of the so-called "Red Cross Squads." These were composed of men, exempt from military service, who placed themselves voluntarily at the disposition of the Red Cross, and were provided by it with uniforms and all things necessary for a regular "health service." The Red Cross Society itself has a great number of carriages at its disposal, and also sometimes commandeered motor-cars, and prepared them for the transport of the wounded. The troops on active service, like the Medical Corps, also used such vehicles in great numbers.

A further task of the Swiss Red Cross consisted in the training of well-qualified Red Cross women nurses (Red Cross sisters). Besides these there were other training establishments, either religious or lay (the latter are the mother houses which train nurses). At the very beginning of the war the Red Cross reckoned on the services of 960 sisters who could be employed in the care of sick soldiers. Many of these were employed in the huts for the wounded, set up at fixed distances behind the front, and in the military hospitals.

The Swiss army was severely tried by the influenza epidemic in the summer of 1918 and in the following winter, and that too during the general strike (see below). If the Swiss Red Cross had had many claims upon it previously, it was now scarcely able to meet the tremendous demands made upon it, first, by the army leaders, and later on (at first the plague was contemptuously termed "the Spanish gripe") when the epidemic spread to a totally unexpected extent among the non-military population, and the unceasing cries for help from this side resounded louder and louder. As the epidemic spread more and more widely, voluntary help had to be enlisted. Here stepped in the so-called "Samaritan Associations" (St. John's Ambulance), already closely connected with the Red Cross, and encouraged their members, with a certain amount of training obtained in voluntary sick-nursing courses, to place themselves at the disposition of the afflicted families. The chief work, however, fell upon the Red Cross and its professional trained nurses, and it is amazing how much the Red Cross achieved in this department. About 10% of the professional nurses (sisters) died of their exertions.

In another respect too the Red Cross rendered excellent service. As is well known, the American Red Cross Society gave some £20,000 to the Swiss military nursing department. This sum was employed in creating convalescent homes for the Swiss soldiers who had suffered from influenza. The Swiss executive put this task also in the hands of the Swiss Red Cross, which, however, later on had to make considerable additions to this amount of money.

In consequence of the spread of the influenza epidemic it became necessary either to suspend or to delay the holding of the training

courses for recruits, the subsequent drill courses, and the education of the non-commissioned officers. The percentage of invalid soldiers was unexpectedly high, and as the epidemic was so rapid as to seem like an explosion, it could be combated only with very insufficient means. Hence very caustic criticisms were expressed without reserve. These demanded publicly the dismissal of the chief of the medical department of the Swiss army, who was said to be already overweighed with the care of the "interned" foreign soldiers, and so could pay too little attention to his own Swiss soldiers, and had ordered precautionary measures at too late a period. All kinds of military hospitals, if one can credit the accounts in newspapers of all shades of opinion, presented a very sorry appearance. The care of the foreign interned soldiers was taken away from this Swiss chief medical officer, and also, after an enquiry, he was acquitted of want of attention to his own Swiss soldiers.

After the Armistice (Nov. 1918) the Swiss army could gradually be almost wholly demobilized. The defence of the frontiers was entrusted to volunteer troops whose pay was fixed at from 8 to 10 francs (6 to 8 shillings) a day. This afforded a decent income at least to many who no longer earned anything, whether because of the direct effects of the war or of the prolonged military service in their own land. It was asserted that in consequence of the prolonged mobilization the Swiss soldiers had gained immensely in military efficiency. But it was a pity that such efficiency cost the little land of Switzerland between 40 to 50 million pounds, and this expense had to be met by raising the customs duties, taxes on excess profits, two sets of special "war taxes," etc., which, it was hoped, would bring in the necessary funds, if only after a lapse of many years.

Once again considerable bodies of troops had to be called up because of the general strike (Nov. 1918), which failed in a few days. And these extra troops were required also by reason of the break-up of the German and, especially, the Austrian armies, which flowed back like a flood, and threatened a regular invasion of Switzerland.

In Nov. 1918 Gen. Willie resigned his post, as he considered that his work was at an end. In the same month the military pensions were increased 10%, and the export of arms and ammunition forbidden, while the bureau of the Swiss general staff was also dissolved.

To meet the emergency support of the families of poor soldiers during the four years of the mobilization period nearly £2,000,000 were expended. Both for the mobilized soldiers and for the volunteers the daily pay was raised to about 7s. Before the war ordinary soldiers received only 8d. a day. The old arrangements were put into force again in March 1920.

The defence of the northern frontier had to be strengthened again at the time of the signature of the Peace of Versailles (June 1919), for a huge immigration from Germany was feared. Later, the frontier police had also to be strengthened because of the great amount of smuggling and the enormous number of people who crossed the frontier because of the bad conditions of life in central Europe and the lack of employment, for Switzerland, as the sole non-enemy land open, was regarded as an *El Dorado*. On Aug. 28 1920 the watch on the frontiers was definitely abolished. The strict watch on the frontiers had greatly impeded all facilities for travelling, and the very severe regulations as to the visa of passports and payment of other dues were subsequently greatly lightened.

*Economic Effects of the War.*—After the first excitement had died down, there were, in the first months of the first year of the war, no notable advances in the prices of various articles in Switzerland. This took place gradually, as the difficulties of importing articles increased. As early as Nov. 1914, Italy announced that she would place no hindrances in the way of the export of articles of food and supplies of raw materials.

In the matter of corn Switzerland was not in a very favourable position at the beginning of the war, for the supplies existing there would have barely sufficed for a couple of months. One must not forget that the Swiss agriculturists devote their attention far more to milk and cheese than to corn. This latter, therefore, could be delivered more cheaply by foreign countries, and was a far less profitable occupation for the Swiss farmer than milk and its products. Hence Switzerland fell more and more into a state of dependence on foreign countries.

The Swiss authorities naturally first of all attacked this pressing problem, and tried to find a remedy. They acted very shrewdly in that they introduced, Jan. 9 1915, a provisional monopoly of corn, and issued a special decree relating to its export. Thus the country was to a certain degree provided with the raw materials for bread and, above all, a bar was placed on all speculation in this most necessary article. Hence it was possible in the following month of May to note that the regular supply of corn was proceeding quietly, and that Switzerland was better supplied with corn than at the beginning of the war.

In the case of various articles such as bread and milk, a prohibition to export them was issued at once. It may cause surprise

at first to be told that milk was included in such a prohibition. But whoever is aware of the fact that nearly all the milk, so far as it is not consumed within Switzerland, was worked up into various shapes (e.g. cheese, butter, condensed milk) and then was exported in great quantities, will not find fault with this prohibition, when he learns that in Switzerland itself there were periodical milk famines for the native consumers. And it came to pass that milk itself was exported from Switzerland. For example, in the frontier city of Basle, the inhabitants at the beginning of the war were forced to exchange milk for vegetables grown in Alsace, because for ages the supply of fresh vegetables for Basle had been supplied by Alsace alone.

When the war had lasted about a year, and no end to it was visible, the necessities of life in Switzerland began to be not only more expensive, but also scarcer. In June 1915 it was therefore forbidden to export any articles of this kind. This regulation was due to the act of profiteers, who bought these necessities of life in huge quantities, and then accumulated them for export to central Europe. Switzerland now found itself in a rather awkward position. If she forbade the export of necessities of life, central Europe menaced the stoppage on their side of the import into Switzerland of the various articles which she most needed, such as coal, raw materials, artificial manure, etc. On the other hand, the Entente threatened Switzerland with a rationing of the consignments of necessities of life in case the export of such to Germany and Austria were not entirely stopped, for the Entente had soon discovered that for central Europe this matter was the sorest point in its war administration.

In the course of wearisome negotiations with both parties the Swiss tried to find a satisfactory arrangement. So first they tried to found with Germany some sort of organization for imports. Industrial firms founded private import trusts, e.g. in Geneva, under the name of *Société auxiliaire du Commerce et de l'Industrie*. A similar trust was created in St. Gall, and in Basle a so-called "Import Trust Company." It became harder and harder to assure sufficient supplies for the whole country. The imports of necessities of life from the "Free Zones" to Geneva were subject to strict supervision by France. On the heels of the corn monopoly of 1915 there followed in 1916 a monopoly of the importation of rice. In order to ascertain the amount of existing stocks of provisions within Switzerland the Swiss executive ordered a return of the supplies of such wares as were found in the entire country. As the supplies of necessities of life became scarcer, so did the prices rise steadily.

The "S.S.S." (i.e. *Société suisse de Surveillance économique*), with its headquarters in Berne, had itself entered on the commercial registry. Complaints were made by important members of the general public that by this action the exports and imports were placed practically under the control of the Entente. It was, however, too easily forgotten that naturally it was not the intention of the Entente to permit an uncontrolled import to Switzerland, and then an uncontrolled export to central Europe, and so supply its enemies with the things they lacked. But the Swiss rightly argued that it was absolutely essential for them to keep up a certain exchange of commodities with central Europe. For instance, cattle in great numbers were exported to Germany and Austria-Hungary, whence coals, iron, steel, manure, sugar and other needful articles were imported into Switzerland.

It would have been far easier to supply Switzerland with all these goods, had a larger number of railway goods trucks been available. But many were away in foreign parts in order to collect the accumulated goods in foreign harbours, because neither France, Germany, nor Italy had any trucks available for the through journey to Switzerland. Often the trucks were delayed for months on the way, or were utilized by the belligerents for their own needs, so that quite often Switzerland had to make protests, and to claim the return of its trucks. Even in 1921 France was still refusing to pay the sum agreed on for Swiss trucks held up and utilized by her. In consequence of this insufficient supply of goods trucks the import of corn to Switzerland was at one time quite blocked, and this caused no little anxiety in that country. As the feeding of the Germans began to be more and more diffi-

cult, and the prisoners and evacuated persons had to suffer thereby, many good persons in the Entente lands caused bread to be baked in Switzerland, and then, with other articles, to be sent to Germany for the use of the Entente subjects interned there. Switzerland had nothing to urge against this proceeding so long as there were sufficient supplies for its own people. But later on the supply of wheat for this purpose had to be specially delivered by the Entente. In the same year (1915) a prohibition to export cotton was issued, and from Nov. 25 onwards cheese could not be sent away in quantities of more than 1½ lb., and licences to export butter were no longer granted.

It was in 1916 that the profiteers were most numerous and most active in Switzerland. In April the Swiss executive had to make new and sharper laws against the speculators who chose the necessities of life as their field of operation. In Geneva a great organization was discovered which busied itself with such speculations. By order of the cantonal executive considerable supplies of coffee, cocoa, and chocolate were seized, and a number of foreigners expelled. Great quantities of rice and fat were also confiscated in Basle and in Buchs, on the Austrian frontier. One must assume, of course, that the greater portion of these goods had been smuggled over the frontier. Soldiers, customs officers, frontier guards had their hands full with countering the tricks of smugglers, speculators and profiteers.

Henceforward the economic relations began to get sharper and sharper. After the inquiry as to the existing stocks of sugar came the sugar monopoly. This had become necessary because the wholesale firms were no longer willing to undertake the importation of sugar. (Before the war Switzerland imported annually sugar to the value of about £1,500,000.)

As the blockade of the Central Powers by the Entente became more and more strict, this had a reflex action on the economical situation of Switzerland. That little country found itself hard pressed from all sides. In June 1916 Germany threatened the stoppage of all exchange of goods if Switzerland would not deliver those which had been stored on German account in Switzerland, and the Entente as firmly refused to let this threat be carried out. In the same month a Swiss delegation journeyed to Paris in order to remove these difficulties. But at first no settlement could be reached, for the Allies and Germany both obstinately clung to their points of view. Finally in Sept., with great trouble, an arrangement was concluded with Germany. Hardly was this in force when France, England, and Italy required that Switzerland apply to them measures similar to those which Switzerland had accepted in the Germano-Swiss arrangement. How complicated this situation often was for Switzerland is shown best by the Note, according to which the Entente required from Switzerland a prohibition for the export of all those manufactures (machines and parts of machines), the making of which required oil for greasing them which came from the Entente states. The distrust of Switzerland became greater and greater. Germany complained that Switzerland had abandoned its neutrality, and was under the protection of the Entente. On the other hand, the Allies grumbled that the goods delivered by them were handed over by Switzerland to the Central Powers. What wonder then that the saying became prevalent in Switzerland—"A neutral Power is kicked from the left, and whipped from the right."

The following fact will show how much during the war Switzerland had to depend on a reasonable amount of imports. In 1916, despite all the efforts of the Swiss farmers, only two-thirds of the supply needed for the country could be produced. Besides wheat for bread, raw materials, artificial manure, cattle for slaughter, fat, and by far the greater amount of the potatoes used, had to be imported from foreign parts (Germany, Holland and Italy). In 1916 Germany exported to Switzerland 1,600 trucks filled with potatoes, both for consumption and for sowing.

For foreigners it was not easy to understand why Switzerland placed the seizure of the harvest and the fixing of maximum prices for the most important necessities of life in the hands of the Military Department, for in Switzerland, as in other lands, so-called official Food Departments had been set up. It was easier to understand that the military authorities were empow-

ered to issue orders that the supplies of hay and straw of each harvest should be commandeered. Inquirers were informed that the Military Department or the Chief War Commissariat office had, in the course of years, accumulated a great stock of corn, which was renewed every three years. When, at the very beginning of the war (Aug. 27 1914) the Swiss executive sanctioned the grinding of "full flour" and then, as is well known, ordered a corn monopoly for the Confederation (Jan. 9 1915), and also commandeered the entire corn harvest, the Chief War Commissariat office was the right authority to carry these orders out. But on Aug. 1 1917 a central bureau for the provision of bread was set up, and on Aug. 10 1917 this was followed by a Swiss bread bureau. On Sept. 13 1918 a Swiss Provision Department was resolved on, and the bread matter was entrusted to it.

The entry of Italy into the war (May 23 1915) was a hard blow to Switzerland, making it more anxious than ever, but still worse was the declaration made by Germany (Feb. 1917) to the Allies of the unrestricted submarine warfare. By this step Germany won no sympathy from the neutrals, although the Swiss executive refused the suggestion of the United States to break off all diplomatic relations with Germany. The Swiss held that this refusal was in accordance with their neutrality, as Germany was the sole land which supplied coal to Switzerland, for the Entente had now to send coal to Italy and could not supply it to Switzerland. At any rate Switzerland got coal from Germany, despite increased prices, cheaper than Italy did from its Allies.

The declaration of Germany (on Feb. 1 1917) that the port of Cetté lay outside the blockade zone was only a poor comfort for Switzerland. It ought to have secured previously a reasonable amount of imports. France strained its resources to satisfy the demands of Switzerland as far as it could, and sanctioned important traffic alleviations for the transport of necessities of life. But this did not hinder the needs of Switzerland from being increased. On Feb. 12 1917 two "meatless" days per week were ordered, and on other days only a single dish of meat was allowed for each meal.

One misfortune followed another. Soon the Argentine Republic announced (April 1917) that it had forbidden the export of wheat,—even the supplies already bought by Switzerland.

However, it must not be thought that during this critical period Switzerland had simply folded its hands on its breast. It tried as far as possible to make itself independent of foreign countries by directing additional planting of potatoes, vegetables and materials for bread. Flowers disappeared from all gardens. Everywhere their place was taken by potatoes and other vegetables. The pleasure parks and drill grounds in and around the towns were commandeered for the same purposes. In the evenings, when the day's work was done, the workmen of the towns were seen, pick and hoe in hand, busy turning up the ground which previously had served all purposes except the planting of useful things. The State ordered each parish to put gratis at the disposal of the poorer classes land for cultivation, and even swampy spots had in all haste to be prepared for cultivation. It is easy to understand that sometimes practical impossibilities were demanded. "One lives and learns." Next, after the land had been prepared for cultivation, suitable kinds of manure were no longer to be had. Those who were not owners of cattle could produce none. Artificial manure of good quality proved too dear to be purchased by poorer people. These were obstacles that must not be underestimated, but absolute need and the horrible period of the war overcame them all. Frequently the results of this compulsory planting did not even approximately reward the pains and work which had been bestowed upon it, but people were too filled with joy to despise the little that was actually the result. Thousands and thousands of families who previously did not produce necessities of life had themselves to plant the amount of potatoes and vegetables required for their own use, and so considerably relieved the crying need. In 1917 120,000 trucks of potatoes were produced (the normal production was about 100,000 trucks). But there was no abundance of this commodity, for in many poorer families potatoes had to replace macaroni, and such like wares which had become more expensive.

These measures on the part of the Swiss authorities were indeed very drastic, but they could not have acted otherwise. The townsman, like the country farmer, was affected by them. The latter indeed had to submit to regulations which meant a revolution in his ordinary business. He was ordered, without the slightest regard to the number of his cattle, to plant a fixed quantity of his land in corn, in such and such a manner. With far less help than heretofore (for the men of military age were generally absent), the peasant women and their half-grown children had alone to do all the work. Not infrequently even their horses were taken away for service on the frontier.

When the peasants had planted, as ordered, the fixed quantity of land in corn, and so helped in the supply of bread, it turned out that now they had too little hay for their cattle. Experience taught here, as elsewhere, that an existing state of things could not be simply changed by the alteration of a screw in a machine. The aforesaid regulations reminded men of the State right of tutelage in the matter of dealings with corn, as had been usual in Switzerland as late as the 18th century. Great quantities of corn were procured and stored in granaries, in order to secure cheaper bread to the people in general.

The more profitable pasture business (e.g. breeding of cattle and milk industry) had developed from agriculture. Before the war there were big farmers in Switzerland, who only grew potatoes and other vegetables enough for their own use. But the rest of the land was laid down in grass. So it is easy to understand that before the war Switzerland could export yearly huge amounts of cheese, butter, and condensed milk.

Against the introduction of "bread cards" Switzerland fought with tooth and nail. The workmen in the towns were not willing to be deprived of their unrestricted amount of bread. A middle way was therefore tried in Switzerland—the grinding of the corn less finely, and the prohibition of the sale of fresh baked bread (Feb. 12 1917). Further, in May, a decree directed that bread should only be sold 36 hours after it was baked. But already in Oct. the final solution of this problem could no longer be deferred—the daily ration of 9 oz. a head.

Bread and meal were joined on the same card. The bread card was split up into such small rations that the traveller could obtain in the hotels and restaurants per portion only 1½ ounces. This regulation was followed in Feb. 1917 by the order to make macaroni, etc., only out of eggs, and then on March 1 1917 appeared the cards for rice and sugar. In the case of sugar about 2½ lb. extra were allowed per head for making jam.

Every month or two Switzerland had to start new negotiations with the belligerents, and to conclude new agreements. In May 1917, the negotiations about the management of the S.S.S. were brought to a conclusion, and an understanding was reached about the import of fodder and the export of live cattle. For the export of fodder from the Entente lands, Switzerland had had to export live cattle as "compensation." A new economic agreement between Germany and Switzerland was also concluded.

A special chapter in the provisioning of Switzerland was formed by the struggle about the price of milk. Here the consumers and the producers were often hotly opposed to each other. The workmen in the towns reproached the peasants with illegal exploitation of the hard lot of the people, and that the latter often from time to time intentionally brought about a milk famine in order to drive prices still higher up. The "Town Associations" (a product of the war as against the country) took an active part, though not always with the same arguments, in this struggle against the peasants. These, on their side, refused absolutely, seeing that all kinds of fodder were always becoming dearer, and by reason of the general rise in prices, to supply their wares at the same fixed price. It was not always easy for the authorities in case of these quarrels to hit on a middle way which was good for all parties alike. One reason for the scarcity of milk was certainly that Switzerland temporarily exported many head of cattle, and this business wasted much milk. Then again, as butter and cheese rose in price, greater supplies of these articles were manufactured, as it was the more profitable business. All this took place, be it well understood, at the expense of the consumer, who had to suffer much thereby.

In order to assure nevertheless a sufficient supply of milk for the Swiss people in general, the Swiss executive empowered the Agricultural Department to fix the amount of the milk rations allowed to each parish, and sanctioned the delivery of milk at

reduced prices to persons of small means. The maximum price for a litre (1 $\frac{1}{2}$  pt.) of milk was therefore fixed at 33 centimes (about 33d.) in April 1917, but for people without means at 26 centimes (about 26d.). The State and the parishes had between them to make up the deficiency. In order to create a closer organization and to render the commerce in milk somewhat the same for all 22 cantons, a central bureau for the supply of milk and its products in Switzerland was set up in Aug. 1917. It was empowered to issue decrees, and to subject the whole industry to Federal control. That was quite necessary, because it happened that the milk for the inhabitants of the towns was already rationed (so in Berne on Jan. 1 1918 the daily allowance a head was only three-fifths of a litre), while in the country free trade prevailed in this business. As the danger of a fresh rise in the price of milk became more and more imminent, the town workmen opposed it vigorously. They threatened a general strike if this most essential commodity should be again raised in price. In the Chamber of Deputies of the Swiss Parliament a compromise was made on this basis—the Swiss executive to grant one rappen (less than a farthing) per litre to the milk producers, and to pay the extra expenses of the transport—this was only to avoid a fresh rise in the price of milk (Oct. 1917). This was well meant, but it turned out later to have been a mistake, since from this time onwards rich and poor profited by this arrangement, and the Swiss authorities had to pay out a huge amount of money.

For the time certain kinds of cheese (cream cheeses, etc.) were not allowed to be sold, and the consumption of butter was restricted. Finally, it was arranged that each landowner was obliged to deliver a fixed quantity of milk from each cow for consumption. When later in 1918–9 the rationing was still more limited (Oct., half a litre, and in Nov., one-third litre per head) this evil was not so much due to any intentional over-production of milk products by the peasants, but, as pointed out above, because many peasants by reason of the compulsory planting of corn, and dearer hay, etc., and the consequent hay famine, could afford only to keep a far smaller number of cattle. This circumstance may have affected the production of milk more than was stated above. It must be added that children up to a fixed age and persons over 60 could claim an extra ration—so too sick persons, but for these a medical certificate was necessary.

At the beginning of the war people were much perturbed by the payment of 26 rappen (about  $\frac{1}{4}$  of a franc) for a litre of milk, and yet in 1921 the price was 52 rappen (about  $\frac{1}{2}$  franc), or an increase of 100 per cent. After the conclusion of peace and on the return of more normal economic conditions it was hoped that a slight alleviation would ensue. But in 1919–20 the foot-and-mouth disease in Switzerland increased to such a degree that at the end of 1919 the daily ration of milk in the towns sank to below the average in the war-time—to one-third of a litre. The foot-and-mouth disease caused Switzerland a loss of about £5,500,000. Finally, in April 1920 this limitation was abolished. The milk famine was one of the greatest calamities that occurred in Switzerland during the entire war period.

It goes without saying that macaroni, groats and oatmeal, barley, cheese, butter, fat, and oils were all rationed, and even also, in part, potatoes and coals. The supervision took place by means of specially issued cards. The butt of the card had to be given up every month when new cards had to be procured. These bore every month differently coloured signs of authenticity. A regulation was also made that in each household even necessities of life, which were not rationed, should not be kept in quantities exceeding the supply required for two weeks.

Some necessities of life were meted out with a very sparing hand: thus only rather over 1 lb. of meal per head and per month was sanctioned, while, from Oct. 1917, white meal and groats were only allowed for hospitals and sick persons, and, even to procure these, corresponding bits of the bread and meal card had to be sacrificed. Other important necessities of life were rationed as follows: maize about 14 oz., rice about 9 oz., and sugar about 20 oz.—in each case per head and per month. But even these rations were not fixed fast—on the contrary they were raised or lowered according to the existing supplies imported.

The restrictions that were most felt were those on butter and on fat for cooking. Foreign lard, even before the outbreak of the war, had been imported in great quantities. But afterwards the imports of this article fell off more and more—in July 1917 it had decreased by 90 per cent. Hence the supervision of all kinds of fat was placed under State control, and in Jan. 1918 a so-called "Central Bureau for Fat" was set up to ensure the provisioning of the country with fat and oil, both for eating. The fat and butter cards (fat for eating and oils) were brought in on March 1 1918. They allowed about 12 oz. of fat and about 5 oz. of butter per person each month. In June the ration of butter fell to about 3 $\frac{1}{2}$  oz., and then rose again to about 9 oz. After the Swiss Government succeeded in buying in America (Jan. 1919) 15,000 tons of pigs' fat, it became possible to abolish the rationing of fat in July of the same year, but the butter cards remained in use for two months longer.

About the same time (July 1919) the rationing of macaroni, groats, oatmeal, and barley was abolished, and two months later (Sept.) the same was done with the bread and meal cards, and finally with the "meatless" days.

For the poorer classes so-called "Distress Relief" was organized, i.e. the Confederation, the cantons, and the parishes together paid over to these poorer people a portion of the price of certain necessities of life. The principal objects of this charity were bread, milk, and potatoes. In the towns many classes of the population had to be supported in this manner—in the town of Berne alone about 27%. In the summer of 1918 the increase in the prices of necessities of life rose to 120%, and in the autumn of the same year to 150%. Throughout the country the town workmen organized demonstrations against this increasing cost of necessities, and these were combined with other matters of political discontent, these latter being stimulated by the events in Russia and in Germany and all leading up in Nov. to the general strike (see below).

Manufacturers in general accommodated themselves quickly to the state of things produced by the war. An exception was formed by the embroidery industry of eastern Switzerland, which was paralyzed through insufficient exportation and lack of foreign orders. On the other hand, the watch factories did very well, because they could manufacture parts of ammunition for the belligerents, which brought in much money, both to masters and men. The same thing happened with the great industrial magnates, who manufactured turning lathes, machines or parts of machines for the same object, and exported them. The delivery of completely manufactured ammunition was forbidden by the Swiss executive as being contrary to neutrality, but it was not difficult to get round this prohibition. Each of the belligerents sought to arrange matters to its advantage. Germany once claimed that every manufacturer of western Switzerland who delivered articles to the Entente should receive no more German coal for his factories. France, on the other hand, forbade the use of grease for machines and parts of machines which were to be exported to Germany. It was not always easy for Switzerland to steer the right course, without totally depriving its workmen of their wages.

The provisioning of Switzerland with coal proved often a very difficult and complicated matter. At the beginning of the war, and in part even up to the year 1916, it was not possible to complain in Switzerland of a coal famine, properly speaking, for the prices had risen by not quite a quarter per ton. Before the war one had to pay to the coal merchant (including his profits) about £2. 8s. per ton, and in 1916 some 7s. or 8s. more. But matters changed altogether in 1917, for not only did the price (including the profits of the coal merchant) rise to £5. 4s. but restrictive measures were taken. By a decree of the Swiss executive of March 7 1917, no one was allowed to procure a supply of provisions sufficient for over three months. In Basle the so-called "Central Bureau for Coal" was set up. Any person who required more than five tons of German coal had to take a share in the aforesaid company, or else to pay an extra £2 per ton. The object was to secure to Germany an adequate money advance, probably in order to compensate her for the loss on the exchange. Germany was required to provide solvent guarantors, so as to make sure that the money would be forthcoming. Later on, a local "Coal Supply Bureau" was set up in every town and every parish, which fixed the amount that any person could be allowed, and supervised the distribution. The prices for good coal (including merchants' profits) amounted to £10 per ton. New restrictions were often issued. The census of the amount of coal was soon followed by its rationing. It is well known that Switzerland, apart from peat and some slate coal, possesses no coal proper. That fact suffices to prove how dependent she is in this respect on foreign supplies. A "Swiss Coal Co." was formed, the object of which was to support financially efforts to find more coal in the country. Researches were carried on all over the land, and a certain amount of coal of poorish quality was found in the cantons of Berne and of the Valais. Peat too was cut, wherever there was a possibility of the smallest supply. But one cannot be surprised that, despite the high prices, the quantity of this coal fell far short of the amount required.

Soon after the scarcity of coal began, and particularly by reason of the rise in its price, the railways and the steamboats on the Swiss lakes were forced not only to raise their fares, but to take other restrictive measures. First of all the "excursion tickets" were suppressed, and then also the cheaper sorts of return tickets abolished (1917). The circulation of trains was reduced from March 1 1918 by a third. In Nov. 1918 the State railways raised their tariff for goods by about 80%, and in the same month experiments were made with supplying locomotives with wood instead of coal, and this, in consequence of the ever-increasing coal famine, even in the case of fast trains. The cantons were each bound to deliver a certain quantity of wood, according to their size and their supplies. Canton Berne, in particular, had to furnish very large quantities of beech wood. Previously, the whole supply of fuel had been seized by the State. All public bureaux and post-offices had to reduce the hours during which they were open, schools had to have holidays, etc. One restricted railway scheme appeared after another, and from Dec. 1 the circulation of travellers, on those bits of the railways which were still run by steam, was provisionally entirely suspended on Sundays and festivals. The only trains allowed on those days were those which carried milk. At the same time the distribution of letters on Sundays was discontinued.

In this time of need strenuous attempts were made by the Swiss authorities to electrify the railway lines, where this could be done

most efficaciously. The private non-State railways were encouraged to do the same, and subsidies were promised to them for that purpose. Although, with certain exceptions, such as the St. Gotthard line and some smaller bits, this permission could not be utilized to the extent required, this is to be explained by the unheard-of prices asked for raw materials. The purchase of electrical machines alone absorbed such huge sums that the necessary capital could not be brought together.

In Oct. 1920 a fall in the price of coal took place, and the supply also gradually became better than heretofore, so that in the winter of 1920-1 the rationing of coal was abolished. The coal supply organization in Basle was wound up. But now another difficulty appeared. In consequence of the augmented supply the "Central Bureau for Coal" had acquired great quantities of coal at prices which were still high. Likewise the supply of peat had increased in amount. But as the coal prices sank the supply could not keep pace with the reduction in prices unless at a great loss. Business men complained that they could get coal direct from the pits at lower prices than those payable in Switzerland. The Swiss executive resolved to give financial aid for the distribution of the existing stocks in the country at cheaper prices. But it imposed on each ton of imported coal an extra customs duty, and this measure was to last until this advance was reimbursed.

*Treaties.*—In order to complete the picture of the economic difficulties which existed in Switzerland during the war we must here add a short account of the treaties which she was compelled to conclude with the belligerents.

The "S.S.S." (*Société suisse de Surveillance économique*), intended to regulate the circulation and employment of wares in the interest of the Entente, was founded on Oct. 11 1915. At the same time the "Treuhändstelle" for commerce with the Central Powers came into existence.

On Sept. 2 1916 the so-called Economic Agreement was concluded to facilitate the exchange of goods. Germany by this had to release per month 253,000 tons of coal, and the amount of iron and steel required by Switzerland. Switzerland, on the other hand, handed over products of milk, meat, etc. A Swiss export committee looked after the export of war supplies, produced with German raw materials (the so-called "Swiss Central Iron Bureau"). It was forbidden to use German iron or German coal for the production of war supplies destined for the Entente.

On Aug. 20 1917 a new arrangement was made. Germany was to grant permission to export 200,000 tons of coal at £3. 12s. a ton, and 19,000 tons of iron and steel, in both cases per month. On its side, Switzerland was to grant Germany a credit per month of £800,000 (foundation of the "Central Bureau for Coal").

On Sept. 29 1917 this arrangement was followed at once by a similar agreement with France. A group of Swiss banks granted to a group of French banks a credit per month of £500,000, this to last from October to December. In return Switzerland obtained from France certain economic reliefs. After two months this arrangement was renewed for 10 months, the credits allowed rising with certain improvements in the import of goods. On March 20 1918 a similar credit was granted to a group of English banks, the monthly maximum amount being fixed at £400,000.

On Aug. 30 1917 an agreement with France and Italy was concluded for the export of wood, to be worked up, from Switzerland. On Dec. 5 1917 the United States also made an agreement to supply 240,000 tons of bread-stuffs, till the next harvest. Other kinds of goods were "contingented." The lack of room on ships delayed, however, the delivery of these supplies very much. In place of the agreement with Germany (which had run out) a new treaty, much less favourable, was concluded (May 15 1918). Germany was bound to give leave for the export of 200,000 tons of coal, iron, and steel. The Swiss "Treuhändstelle" had to superintend the exchange of goods according to the S.S.S. system.

The Economic Agreement of May 5 1915 with Italy was still in existence. But on Nov. 1 1918 an economic and financial treaty was made with this country, as also with France and England. The credit to be allowed every month was fixed at a maximum of £200,000, but the amount of imports was limited.

In order to execute all these financial obligations of Switzerland the "Swiss Financial Association" was founded in Lucerne on Aug. 1 1918. To protect itself against the imminent danger of a maritime blockade, Switzerland agreed with Germany on April 24 1918 that free passage should be given for all cargoes destined for Switzerland.

In a fresh financial agreement with France (July 19 1919) Switzerland obtained a credit of about £1,250,000. The economic treaty with this country ran from March 25 1919 to the end of 1919. In Oct. and Nov. of that year the contingents of Switzerland for watches and embroideries were somewhat raised. In a fresh agreement of March 10 1920 a bargain was made with Switzerland for the delivery of 10,000 tons of coal (brown coal) from the pits on the left bank of the Rhine each month. Switzerland had to supply, among other things, electric power, but the promised amount of manure received by Switzerland was quite insufficient.

At the end of Nov. 1919 a new compensation treaty was made with Italy about the delivery of oil-cake and hay in exchange for cattle, for breeding and use.

The coal agreements came to an end in the beginning of 1919.

On Jan. 22 1919 an economic treaty was made with the United States; bigger contingents of goods were secured to Switzerland and a tonnage of 70,000 (soon raised to 100,000), England and France guaranteeing these amounts.

On March 25 1919 yet a new agreement was made with France about the supply of goods. France promised to deliver 60,000 tons of coal from Lorraine per month (at £4. 16s. a ton) and also manure and facilities for the transport of goods. On its side Switzerland engaged to deliver cattle for breeding and certain goods (chocolate, watches, embroideries, etc.) to the value of about £108,000 per month, and also a new credit not to exceed about £1,500,000 at the most.

The credit arrangement with England of March 20 1919 was not renewed. Later on, England too raised the contingents which could be imported, and sanctioned (March 1 1919) again the admittance of embroideries and silken goods. On April 28 1919 the "black lists" were abolished, and also the certificates of nationality and the contingents of imports permitted by the S.S.S.

Such were the economic agreements which Switzerland had to sign. Her economic dependence on foreign countries is thus abundantly clear, and yet it must be said that all the belligerents had taken much kindly notice of her position in this way or in another. It must be recognized that the Swiss authorities managed to get well through all their difficulties, and did not fail to take precautionary measures (sometimes very incisive) to provide the Swiss with all the necessities of life. But, in consequence of the incredible rise in prices and the excessive prices of necessities of life, even of those which are most indispensable, they were unable to bring it about that the distress of the people should not lead to dissatisfaction, complaints, and great discontent.

*General Strike of Nov. 12 1918.*—The Swiss Socialists (or Social Democratic party) were never stronger, and to a certain degree more feared, than towards the end of the fourth year of the war. The rise in prices of all commodities, and too the unforeseen and the previously unknown dearth of dwelling houses, were utilized very cleverly and ably for the purposes of propaganda, and brought great reinforcements to the Socialists. Protest meetings against too high prices were organized, and these were sometimes accompanied by political demands which caused serious restlessness. The revolution that had broken out in Russia in the preceding year and the break-up (Oct. 1918) of Germany, from the military point of view, and in part also from the political point of view, hurled their waves of revolt as far as Switzerland. Here the leaders of the workmen imagined that the moment was come for violent action. The crisis was the summoning of troops to Zürich, the Government of which on occasion of the memorial day (organized by the Socialists) of the Russian Revolution, feared serious riots. The calling of the troops to Zürich was considered by the workmen as a provocation, and the reply was a general strike for 24 hours, which very soon developed into an unrestricted general strike in the whole of Switzerland. The railways ceased to run, and in most Swiss towns the entire body of workmen took a holiday, though not in the rural districts or in western Switzerland where the strike was sometimes only a partial cessation of work, and ended in a speedy breakdown. In order to make this general strike more popular with the workmen the so-called "Olten Committee of Action" put forth a social and political programme, which was submitted for speedy acceptance to the authorities, and included the following demands. The immediate transformation of the Government of the country so as to be in accordance with the will of the people. The new Government was to bind itself to the following programme at the very least; new election of the "Conseil National" according to the principles of proportional representation; voting rights of all kinds for women; introduction of the general obligation to work, and of the 48-hour week in all public offices and private businesses; the reorganization of the army so as to make it the army of the people; the securing of the supplies of necessities of life, this provision to be carried out with the agreement of the rural producers; insurance for old and sick persons, State monopoly of imports and exports; and redemption of all State debts by the rich.

The Swiss executive refused to negotiate with the strikers, and the peasants made a show of cutting off the milk supplies of the towns. Another hope too of the strike leaders failed. They had expected that the soldiers, especially the members of the association of the "League of Soldiers" (thought to be imbued with revolutionary ideas and later forbidden by Gen. Wille), would

naturally refuse military obedience. The military authorities, however, had taken the precaution to summon trusty troops from the rural and Alpine regions, and so the leaders of the strike saw their hopes falsified. When the news spread of the ultimatum issued by the Swiss executive to end the strike at once, otherwise the strike leaders would run the risk of being put into prison, the general strike came to a natural end. Such a strike has seldom broken down more wretchedly. The 48 signers of the "Olten Appeal" were accused of instigating the strikers to mutiny, and so were handed over to the military authorities for examination. By this accusation was meant any appeal which directly or indirectly was made to the soldiers, with the warning not to march against their own brothers, and not to turn their weapons against the workmen, but, in case such a command should be given, rather to refuse military obedience. By far the greater number of the 48 signers were acquitted. Only a few of the most prominent and the most compromised leaders were kept, and received punishments ranging up to six months' imprisonment. Here, as elsewhere, it became clear that the greater part of the Swiss workmen never would approve a united general strike with purely political aims.

*Interned Prisoners.*—As early as Oct. 1914, a beginning was made with the dispatch of the evacuated civilians home to France, Germany, and Austria, passing through Switzerland. And up to March 5 1916 some 60,000 persons were conveyed back to France alone by the same route.

On Feb. 21 1916 an arrangement was finally made about the exchange of the severely wounded German and French prisoners who were to pass through Switzerland. After the consent of the Swiss Red Cross had been previously obtained, this duty was confided to it by a decree of the Swiss executive. Now began the foreign action of that institute which lasted for five long years. Constance and Lyons were fixed on as the exchange centres; the trains were to pass through Switzerland at night, and the railway carriages required were to be furnished by the State railways.

Before the actual transport took place, "selection committees" visited the various prisoners' camps, in order to inspect the severely wounded men, and to settle which should be included in the exchange. The Swiss Red Cross agreed to defray all the expenses for the food, etc., of these poor men, and their nurses etc., but not the railway fares.

Besides the medical men, male Red Cross nurses accompanied the trains, sometimes also soldier nurses, while women nurses from nearly every Swiss nursing home looked after the invalids. The journeys took place at longer or shorter intervals, but often there were lengthy breaks, due to the state of the war, and to difficulties that arose between the hostile states.

The Swiss people took a great and a very sympathetic share in these transport trains. People flocked from long distances to the railway stations merely to see the trains rush past, and had the feeling that thereby they had showed their sympathy with the unfortunate victims of the war. At the places where the trains halted, the joy was enormous. At some spots the trains had to stop because the people would block them by standing on the rails, and a huge quantity of loving gifts, for which room was scarcely found, literally overflowed the Red Cross carriages.

The good example of France, Belgium, and Germany was followed in Nov. 1916 by Italy and Austria also. The exchange stations here were Como-Monza and Feldkirch-Dornbirn, and many trains came through with Austrians, Bulgarians, Turks, Serbs, English, and Italians. Later on, when Austria resolved to repatriate the numerous Italian conscripts, whose illness was still in the preliminary stages, special conscriptive trains became also necessary. Imbecile soldiers were transported in great numbers. Twice trains, with many such, came through, and no one could determine their names or their homes.

A most pitiful and moving spectacle was the sight of the trains filled with evacuated civilian travellers. Old men with snow-white hair, women of all ages, and children, even unwaned infants, were seen in these trains. These unfortunate persons were warmly welcomed and well fed, in the most hospitable fashion. It is a gloomy chapter in the history of the war.

The interned soldiers were mostly housed in the Alpine regions. This took place for various reasons. First of all, the high air was looked upon as a great factor in their convalescence, and then again they were isolated from the temptations of bigger places and towns, and, finally, in the tourist centres many hotels stood empty, all ready to receive this new kind of guest, and well fitted to shelter great bodies of interned.

No Swiss industry was so hard hit by the war in its very existence as the Swiss tourist traffic, once so flourishing. According to the statisticians, milliards of francs were invested therein, and so, soon after the outbreak of the war, special measures of protection (such as exemption from bankruptcy suits) and also acts of charity had to be taken. What wonder then that the Swiss authorities, by this action in favour of the interned, hoped to kill two birds with one stone, and appropriate these small profits to the stricken *industrie des étrangers*?

The daily sum paid for accommodation, etc., per head was originally four francs, later five francs, and even in 1921 an extra amount of one franc daily per head for 1918 was the subject of negotiation. (These sums were paid by the respective states concerned.) But no state, save defeated Germany, had agreed up to June 1921 to this extra expense. The food was simple and nourishing, and in some places it was more than good.

At the beginning of the period of internment the interned were given free postage for all letters sent to their native countries. And nothing too was charged for parcels sent thence to foreign countries. This humane arrangement was afterwards first restricted, and later on quite suppressed, as the war seemed to be never ending, and the cost to the Swiss post-office ran up to £2,000,000, and even more.

A great difficulty arose as to the employment of the interned. In some places they took to an industry which promised them certain profits. Such were the beautiful, and even most artistic works of art which were produced by simple and untrained soldiers. They acted as joiners, mechanics, turners, wove baskets, made ropes, and nets, painted pictures, etc. In Thun, as early as 1916, a school of commerce was opened for the interned. The universities of Basle, Berne, Geneva, Lausanne, and Zürich allowed interned to matriculate as students. The Bernese University Committee provided in 42 prisoners' camps outside Switzerland both teachers and students with money, food of various kinds, clothing and books. The interned were permitted to hold exhibitions of their products, and special committees were founded to promote the sale of the fruits of their labour. Now and then they received visits from high-placed countrymen (such as Gen. Pau, etc.). They looked after their social amusements themselves. One English committee even got together money for the visits of English women to their husbands interned in Switzerland. The English interned enjoyed the special sympathy of the Swiss. The number of prisoners interned in Switzerland was already in Aug. 1916, 18,936—11,823 French, 4,322 Germans, 1,607 Belgians, 1,183 English, and one Austrian. These numbers later increased very much, and finally, when difficulties arose about food in Switzerland, it could not possibly receive an unrestricted number, and so after a certain time the interned were exchanged for others.

When the internment of wounded prisoners was resolved on in Switzerland this business was entrusted to the chief army medical officer, and the Swiss Red Cross. Practically, the Red Cross took charge only of the transport of the interned to and from Switzerland, everything else being supplied by the army authorities. The interned had fewer invalids than the exchanged prisoners, and so required only ordinary trains with occasional carriages in which to lie down; but many persons seriously ill were sent home, and the Swiss Red Cross looked after all such cases.

After the Armistice the principal transport of the prisoners belonging to the Entente took its start. The sick and invalids were partly sent for in special "sanitary" trains,—French, English, American, and Italian,—the nurses, etc., being supplied by the Swiss Red Cross. All these journeys passed off without any serious accidents, at least it never happened that any one was injured, though the trains went at express speed.

The Swiss Red Cross spent (apart from the railway fares) some £13,000 in carrying out this transport. No fewer than 81,377 persons were conveyed by the Swiss Red Cross, and that without counting the numerous civilians interned and civilians evacuated, who had previously passed through Switzerland, the number of these amounting to several hundred thousands. All these persons travelled through Switzerland.

In April 1919 there were still 5,000 Germans interned in Switzerland. These could only be sent home later, shortly before the home-coming of the prisoners interned in France.

The international action of the Swiss Red Cross extended also to investigations as to prisoners and missing soldiers. From all parts enquiries arrived, relating to the whereabouts of various soldiers. This was a task which properly belonged to the International Committee at Geneva, specially created for this purpose. In many cases, however, the Swiss Red Cross, thanks to its fortunate and useful communications by reason of the exchange of the interned, could answer these enquiries. With this object a special office was set up in Berne for the interned prisoners of war in Switzerland, and to this all enquiries were to be addressed, whether for interned persons or missing persons.

*International Red Cross at Geneva.*—The following was the share of this well-known institution. When hatred and reprisals on both sides got the upper hand, it issued a series of appeals, first of all in favour of common action in carrying out the task of the Red Cross, next to the belligerents on behalf of the wounded and sick, of the nursing staff, of their supplying necessary wants in accordance with the Convention of Geneva, and of the Hague Convention. Next came protests against the torpedoing of hospital ships and against the bombardment of hospitals on the field, the protection of Red Cross unions, the recognition of the Red Crescent, as to the treatment of prisoners, and the distribution of money collected (about £13,000) to the Red Cross associations of the belligerents, as to the reception of Red Cross sisters in Switzerland for rest and refreshment, missions to visit camps of sick prisoners in Italy, Bulgaria, etc., and prisoners' camps in general, the facilitating of communications between the Red Cross associations of the several belligerents, in favour of the sending home certain categories of war prisoners, against the propaganda bureaux, and against the employment of poisonous gas, etc. That is only an imperfect list of the tasks which the International Red Cross undertook, and which it would take a book to describe in detail. Its influence was not less blessed than that of the Swiss Red Cross, and was of extreme importance for facilitating communications between the belligerents. It is worth mentioning that the French poet, Romain Rolland, gave half the proceeds of his Nobel prize to Gustave Ador, the president of the International Red Cross in Geneva, for the war prisoners.

*Help Given to Other Nations.*—As early as June 28 1915, Switzerland hearkened to the cry of distress from little Luxemburg, then occupied by the Germans, and sent flour to help its suffering population. On Oct. 6 of the same year the Luxemburg Minister of State, von Eyschen, came to Berne to arrange for the supply of the necessities of life to his country through the Swiss "Import Trust." The principality of Liechtenstein was supplied also with food-stuffs; this led to its closer association with Switzerland, and in 1921 it had Swiss postage stamps and used francs as money. On Dec. 4 1918, shortly after the Armistice, Switzerland, in order to alleviate the hunger in the German districts of Austria, sent ten trucks, laden with flour, and nine with rice, to Innsbruck. These supplies were reimbursed by the Entente, as also were the 100 trucks of necessities of life sent on the 27th of the same month. Switzerland was selected as being able to send supplies quickly. Later, she sent them from the stocks meant for her own consumption.

But this kind of help was not the only sign of sympathy shown by Switzerland. When the need increased it extended its charity to the reception of badly nourished children belonging to the belligerent states. In Sept. 1916, 760 Belgian children from the occupied territory were long in the canton of Fribourg. In other Swiss cantons such poor children were also received. In the year 1919 alone a total of 43,000 foreign children was received in order

to recover from illness. It were principally Belgian, Austrian, and German children who benefited by this act of charity.

*Obituary, 1910-21.*—Death was especially busy with the great Swiss historians during the decade 1910-20. J. Dierauer (1842-1920); W. Oechslí (1851-1919); Karl Dändliker (1849-1910); B. van Muyden (1852-1912) passed away, as well as Jakob Heierli (1853-1912), the principal authority on prehistoric Switzerland; Adolf Waber (1841-1913), the bibliographer of works of travel in Switzerland; Caspar Decurtins (1855-1916), the great authority on the Romansch dialect; Jean Grellet (1852-1918), the well-known writer on Swiss heraldry; Emilio Motta (1857-1920), the founder and also the editor (for 35 years) of the *Bollettino della Svizzera Italiana*, which rendered such great service for the history of Italian-speaking Switzerland; and Henri Fazy (1842-1920).

The fine arts also mourned the loss of Ferdinand Hodler (1853-1918), the merits of whose pictures were so hotly discussed during his lifetime; Max Buri (1868-1915), the delineator of Bernese peasant life; and Eugène Burnand (1850-1921). To these losses we must add Richard Kissling (1848-1919), the famous sculptor; and J. R. Rahn (1841-1912), the historian of Swiss art.

Other Swiss, each eminent in his own way were Theodor Kocher (1841-1917), the world-famous surgeon; F. Imhoof-Blumer (1838-1920), the celebrated numismatist; F. A. Forel (1841-1912), the physicist and monographer of the Lake of Geneva; Johannes Coaz (1822-1918), the great authority on Swiss forestry, and a mountain climber whose active career ended in 1850; J. H. Graf (1852-1918), the mathematician and leading authority on old Swiss cartography; and, last but not least, J. H. Dunant (1828-1910), the founder of the International Society of the Red Cross at Geneva.

We must not omit a group of men of letters of the "Suisse Romande"—Gaspard Vallette (1865-1911) and Philippe Monnier (1864-1911); and the novelist Edouard Rod (1859-1910).

Our list may be brought to a close with the names of the linguist, Ferdinand de Saussure (1857-1913); and of the Romance scholar, Heinrich Morf (1854-1921).

*Miscellaneous.*—Perhaps the most important event which happened in Switzerland in 1920 was the first meeting of the League of Nations in Geneva, a spot selected, it is said, by President Wilson. In Feb. 1921 Switzerland declined to allow the passage of police troops to guard the peace in the Vilna popular vote.

Switzerland has adopted officially the day of 24 hours, running from midnight to midnight.

Naturally, the possibility of winter sports in Switzerland was excluded (save for the natives) during the war, and they had not quite reached their former vogue even by 1921.

The long war had a most disastrous effect on the Swiss hotel industry. Previously to it far too many big hotels had been built, so that the whole industry was overcapitalized and in a state of great indebtedness to the banks. After the end of the war many hotels were pulled down or diverted to other uses, even in such frequented spots as Interlaken and Grindelwald. It has been stated by H. Gurtner that the total capital invested in the Swiss hotel business was in 1912 about £45,500,000, or about one-thirtieth of the total amount of the wealth of Switzerland. The same writer puts the total value of the hotels in the Bernese Oberland at about £6,000,000 just before the outbreak of the war.

On May 15 1914 a great national exhibition was opened at Berne. But the speedy outbreak of the war nearly ruined it.

The rate of exchange on London varied much during the war. After the first shock it rose to over 26 francs (par 25), but then sank, and attained its lowest point in June 1918, with 18-83½. It subsequently recovered somewhat, but in Aug. 1921 it stood only at 21-64. Of course this involved great losses for English residents and travellers, while the better value, obtained both in France and Italy, drew many to those lands.

*BIBLIOGRAPHY, 1900-21.*—In 1910 the 6th and final volume of the *Dictionnaire Géographique de la Suisse* (the first appeared in 1902) was issued at Neuchâtel, while in 1918 the same publishers began the publication of the *Dictionnaire Historique et Biographique de la Suisse*. (Both publications are issued in French and German.) H. Barth gave to the world in 1914-5 the three vols. (going down to the end of 1913) of his marvellous *Bibliographie der Schweizer Geschichte*. In the domain of constitutional history we have a new and revised edition (1914) of W. Burckhardt's *Kommentar der schweiz. Bundesverfassung von 1874*; A. Heusler, *Schweiz. Verfassungsgeschichte*; E. His, *Geschichte des neueren Schweiz. Staatsrechts 1798-1848* (vol. i. 1920); and W. Raustein, *Die Schweiz. Halbkantone* (1912). For very early Swiss history we have A. Schenk, *La Suisse Préhistorique* (1912); P. E. Martin, *Études critiques sur la Suisse à l'Époque mérovingienne, 554-715* (1910); and Marius Besson (now the Bishop of Lausanne and Geneva), *L'Art barbare dans l'ancien diocèse de Lausanne* (1909).

The very best detailed history of the Swiss Confederation is that by J. Dierauer, entitled *Geschichte der Schweiz, Eidgenossenschaft*, now complete in five vols. and published at Gotha (vols. i and ii., 2nd ed., 1913; vol. iii., 1907; vol. iv., 1912; and vol. v., 1917) which brings the tale down to 1848;—a continuation is in preparation—there is also a French translation. E. Gagliardi, *Geschichte der Schweiz* (2 vols., 1920), is a new general Swiss history.

An important episode in Swiss history is narrated by E. Gagliardi, *Der Anteil der Schweizer an den italienischen Kriegen, 1494-1516* (vol. i., 1494-1509, 1919). Marie Louise Herkin's life of C. V. Bonstetten, 1745-1832 (1920) is a contribution to Swiss literary history of the 18th century. W. Oechsl's *Geschichte der Schweiz im 19ten Jahrhundert*, from 1798 (vol. ii. appeared at Leipzig in 1913, the work will be continued by E. Gagliardi), and J. Winiger's life of Josef Menz, 1834-1908 (1908), like E. Deriaz's *Un Homme d'Etat vaudois, Henri Druey, 1799-1855* (1920), and T. Weiss' life of Jacob Stampfli, 1820-1879 (1920), relate to modern Swiss history. In 1918 W. Oechsl published at Zürich a new edition of his *Quellenbuch zur Schweizergeschichte*.

In geology we have to note A. Heim, *Geologie der Schweiz* (appearing since 1919 in parts at Leipzig). In the domain of the fine arts vol. iii. of the *Schweiz. Künstler-Lexikon* appeared in 1913, as did an extensive supplement to the work. The special works by J. Scheuber, *Die mittelalterlichen Chorstühle in der Schweiz* (1910) and by E. A. Stuckelberg, *Cicerone im Tessin* (1918) are also very useful works in this department.

In ecclesiastical history we have the fine monograph, *Angelomontana* (1914), and vol. ii. (vol. i. appeared in 1907) of J. G. Mayer's *Geschichte des Bisthums Chur* (1914), and vol. v. (1917) of E. Doumergue's *Jean Calvin*.

Another subject of great importance to Switzerland is treated of in H. A. Gurtner's *Zur Verschuldung des schweiz. Hotelgewerbes* (1918), written by a Swiss hotel-keeper's son.

The following works refer to the Swiss Alps—Julien Gallet, *Dans l'Alpe Ignorée* (1910); E. J. P. de la Harpe, *Les Alpes Valaisannes et Les Alpes Bernoises* (1911 and 1915 respectively); and H. Dübi, *Die ersten 50 Jahre des Schweizer Alpenclub* (1913, also in French).

Turning now to the several cantons the following works deserve mention:—

BASEL: R., Wackernagel, *Geschichte der Stadt Basel* (vol. ii. 1916, vol. i. appeared in 1907); A. Heusler, *Geschichte der Stadt Basel* (vol. i., 1917).

GENEVA: L. Cramer, *La Seigneurie de Genève et la Maison de Savoie, de 1559 à 1605* (2 vols. 1912); H. Heyer, *L'Eglise de Genève, 1535-1609* (1906); L. Blondel, *Les Rabbours de Genève* (1919; vol. iii. 1918) of the *Recueil Géologique Suisse*; W. Oechsl, *Les Cantons Suisses et Genève 1477-1815* (1915); and E. Doumergue, *La Genève des Genevois* (1914).

TICINO: Karl Meyer, *Leventina und Blenio von Barbarossa bis Heinrich VII.* (1911).

VALAIS: D. Imesch, *Die Walliser Landrats-Abschiede seit 1500* (vol. i., 1500-19, 1916); and A. Büchi, *Korrespondenzen und Akten zur Geschichte des Kardinals Math. Schiner* (vol. i., 1489-1515, 1920).

VAUD: B. van Muyden, *Pages d'Histoire Vaudoise* (1911), and *Recueil de Géographies Vandoises* (4 parts, 1912-20).

ZÜRICH: K. Dändliker, *Geschichte der Stadt und des Kantons Zürich* (3 vols., 1908-12). (W. A. B. C.)

**SYDENHAM, GEORGE SYDENHAM CLARKE, 1ST BARON** (1848- ), British soldier and administrator, was born in Lincolnshire July 4 1848. He was educated at Haileybury and Wimbledon, and afterwards at the Royal Military Academy. In 1868 he entered the Royal Engineers, and in succeeding years served in various expeditions abroad, including the Sudan operations of 1885. The same year he returned to England, and was employed at the War Office until 1892, being at the same time secretary to the Colonial Defence Committee. He was also secretary to the Royal Commission on Navy and Army Administration. From 1894 to 1901 he was superintendent of the royal carriage factory at Woolwich. During all these years Sir George Clarke, who was created K.C.M.G. in 1893, had earned a great reputation, outside as well as inside his profession, as an authority on military questions, over and above his special subject of fortification. On his retirement from Woolwich, he was made a member of the important committee on War Office reorganization. In 1901 he was appointed governor of Victoria (Australia), and on his retirement in 1904 he became secretary to the Committee of Imperial Defence. From 1907 to 1913 he was governor of Bombay. He had been created G.C.M.G. in 1905, and in 1913 was raised to the peerage. He subsequently took a vigorous interest in many public questions, becoming chairman of the Royal Commission on Contagious Diseases (1913-5), chairman of the Central Appeal Tribunal (1915-6), and president of the National Council for Combating Venereal Diseases. In addition to his classic work on *Fortification* (1890; 2nd ed. 1907), his publications include *The Navy and the Nation* (1897) and *Imperial Defence* (1898), besides handbooks on military subjects.

**SYKES, SIR MARK, 6TH BART.** (1879-1919), English traveller and politician, was born March 16 1879, the only child of Sir Tatton Sykes, 5th Bart., of Sledmeer, Yorks. He was educated

at the Roman Catholic public school of Beaumont College and afterwards at the École des Jésuites, Monaco, and Jesus College, Cambridge. He served in the South African War (1902), in 1904 became secretary to Mr. George Wyndham in Ireland, and in 1905 went to Constantinople as honorary attaché to the British embassy, remaining there until 1907. Before this, however, he had begun a series of travels and explorations, especially in Turkey and the Near East. He published several works dealing with his various expeditions, among them being *Through Five Turkish Provinces* (1900); *Dar-el-Islam* (1903); and *Five Mansions of the House of Othman* (1909). He also prepared maps of the north-western region of Mesopotamia and of the southern districts of Palestine, for which in 1906 he was thanked by the Army Council and Foreign Office. His knowledge of these regions proved invaluable during the World War. In 1911 he was elected to Parliament for Central Hull as a Unionist, and in 1913 he succeeded his father as 6th Baronet. On the outbreak of war in 1914, Sir Mark Sykes raised a battalion of the Yorkshire Regiment, but did not proceed with it to France. He was sent on important special missions to Russia, Mesopotamia and Syria, and published in 1915 *The Caliphs' Last Heritage*. He died suddenly in Paris Feb. 16 1919.

**SYMPATHETIC NERVOUS SYSTEM**, in physiology (*see* 26.287).

On studying the effects of stimulation of the sympathetic nervous system it appears that they are directed towards activating the body for fight or flight. The dilatation of the pupil increases the perception of light; the acceleration and augmentation of the heart-beat increases the blood supply; the constriction of the blood vessels in the visceral area raises the blood pressure, driving the blood from the digestive area, whose functions are simultaneously inhibited, into the skeletal and cardiac muscles, the lungs and the brain. The sweat glands are stimulated to cool the blood heated by increased muscular effort and the hairs are erected in many animals to render them more alarming. The "goose skin" experienced by man under emotional stress is similarly produced, though not now advantageous. Some emotional responses, like some bodily structures, are vestigial remains. The other division of the autonomic system, to which the name of parasympathetic has been given, serves the purpose of building up reserves and of fortifying the body against times of need and stress. Thus by contracting the pupil it shields the retina from excessive light; by slowing the rate of the heart it gives it longer periods for recuperation; it excites appetite and by promoting the assimilation and digestion of food it stores up energy. The sacral division of the parasympathetic is a mechanism for emptying, thus leading to greater comfort. The sympathetic is, therefore, katabolic, converting potential energy into kinetic, and facilitating outward manifestations of that energy; while the parasympathetic is anabolic, directing energy inwards, where it is stored up. When these two are distributed to the same structure their action is always antagonistic.

In pain, fear, rage and any intense excitement, the sympathetic neurons are brought rapidly into play and the action of the cranial division of the parasympathetic is inhibited. Anabolism is in abeyance and katabolism goes on unchecked. This is comprehensible, since these katabolic activities are defensive in origin and aided the primitive animal in its struggle with or flight from its enemy.

Of late it has been realized that each of these divisions of the autonomic system coöperates with its appropriate group of endocrine glands. The sympathetic group consists of the adrenals, the thyroid and the pituitary—each of which are accelerators of metabolism. The intimate relationship embryologically, structurally and functionally between the nervous and glandular elements is best illustrated by the adrenals. The medulla of the adrenals and the sympathetic ganglia originated from similar cells, preganglionic fibres end round both, and adrenalin, the secretion of the medullary portion, produces the same effect on any part as stimulation of the postganglionic fibres; an interesting example of parallelism between a nervous and chemical mechanism. Just as the preganglionic fibre stimulates the secretion of adrenalin, so adrenalin increases the postganglionic responses.

A similar reciprocity exists in the case of the thyroid; it is stimulated to secretion by the sympathetic and the secretion lowers the threshold to sympathetic stimulation. The existence of sympathetic secretory nerves to the pituitary has been shown, but there is no definite evidence of a reciprocal action of its secretion on the sympathetic.

The endocrine group which coöperates with the parasympathetic must be looked for chiefly in the glands of the alimentary tract and its annexes, since the building up of energy must ultimately be derived from the food. Gastric secretion is started by the appetite and the taste of food reflexly stimulating the organs, but it is continued by a hormone in the pyloric glands of the stomach which spur the fundus glands on to renewed effort. In its turn the acid gastric juice entering the duodenum acts on its mucosa to form secretion, which stimulates secretion of pancreatic juice. But the pancreas forms an internal secretion as well, which promotes the assimilation of sugar. Indeed, the metabolism of sugar gives a particularly good illustration of the general principle here laid down. Acting muscle requires three and a half times as much sugar as resting muscle, and the mobilization of sugar into the blood is a necessary preliminary to muscular effort. Accordingly sympathetic stimulation is found to produce this effect, through the adrenals, thyroid and pituitary, the secretion of each of which taken separately will lower carbohydrate tolerance and may excite glycosuria. On the other hand, the pancreas which is innervated by the parasympathetic has a precisely opposite effect, the antagonistic action of the glands being as definite as that of the associated nerves. Another example of this antagonism is seen in the continuous flow of pancreatic juice following removal of the adrenals, which can be temporarily inhibited by injection of suprarenal extract. Again, it is well known that adrenalin dilates the pupil of an excised eye but not of the intact eye of a normal individual. Therefore something inhibits the adrenalin effect. In depancreatised dogs adrenalin does dilate the pupil, and it has been found to do the same in patients suffering from pancreatic disease, since the normal antagonism of the pancreas to the adrenals is then lost. This pupillary response may also be present in hyperthyroidism, suggesting that the thyroid excess inhibits pancreatic activity, allowing adrenalin to show its dilator action unchecked.

The sympathetic nervous system, the endocrine glands and the gonads form a basic tripod entrusted with the duty both of the preservation of the individual and the continuity of the species. Their relationship is shown in disease as well as in health, and is reflected in many neuroses and psychoses. Disease is the resultant of some external action and of the reaction of the organism against it. It therefore draws on the defensive mechanisms and connotes a position of less stable equilibrium in which the body works with more friction. It may demand an increased supply of hormones to compensate for this, which may ultimately lead to exhaustion of the gland that provides it. In this way the balance between the endocrine glands is disturbed, either from overaction of a gland, or from its unopposed action through the loss of an antagonist.

The sympathetic-endocrine system is affected alike by toxic, nutritional or psychic factors, and is particularly likely to be injuriously influenced if more than one such factor is overtaking it. As this system has to defend us against internal foes, such as bacterial infections, as well as external enemies, we find that it plays an important part in the regulation of the body temperature. Since it has been shown that the cerebral vessels are remarkably impermeable to drugs and toxins as long as they maintain their integrity, it has become impossible to explain febrile reaction to infection by a central mechanism. When the activity of the thyroid and anterior lobe of the pituitary is diminished, less heat is produced. When increased production is required, the thyroid and adrenals give histological evidence of increased secretion. Cramer has found this both in fevers and after exposure to cold. He has also experimentally produced such changes by the injection of a drug which causes fever. Infections such as gas gangrene which do not induce a febrile reaction do not produce these changes. He has traced the adrenalin into the blood vessels, whereby sympathetic nerve endings all over the body will be stimulated. At the same time more sugar is poured into the blood, largely through thyroid activity. The oxidation of this sugar increases heat production. It has long been known that the adrenals may show marked signs of exhaustion after a severe infection such as diphtheria, while the thyroid may suffer after typhoid fever. Such exhaustion appears to be an important factor in the psychoneuroses of convalescence.

The influence of nutritional factors on the apparatus is seen in the way in which (1) pregnancy enlarges the thyroid and pituitary;

(2) vitamin defects cause enlargement of the adrenals and pituitary while causing some atrophy of other endocrine glands; (3) deficiency of assimilable protein in the food causes pellagra in which the adrenals suffer, while the sympathetic nervous system shows actual structural degeneration. While toxic and nutritional influences play chiefly on the glandular part of the apparatus, psychic factors naturally act primarily on the nervous part, though ultimately both parts will become affected, whichever is involved first. The sympathetic is the lowest level of the nervous system and retains several characteristically primitive features, such as peripheral ganglion cells, myenteric nerve nets, connector fibres lying outside the central nervous system, and urgent widespread responses, rather than accurately localized and discriminative ones. This is in accordance with the evolution of the nervous system for defense, and with the maintenance of this primitive function by the sympathetic. Pain has been shown by Trotter to be the specialization of the primitive sensation of lower animals, and fear might similarly be regarded as a specialization of a primitive emotion. It is to such sensation and emotion that the sympathetic nervous system preëminently responds. Both pain and fear are apt to become intense when the appropriate motor response is prevented, though they may not be appreciated when vigorous response is possible. Thus during the excitement of a fight neither fear nor pain may be experienced under conditions which would ordinarily induce them. In the civilized state the response appropriate to primitive man has often to be repressed. The effect of this repression may show itself either as an anxiety neurosis, at the psychic level, or at the sympathetic-endocrine level in certain affections of the associated glands, and in cardiac or digestive neuroses. Such repressions are particularly likely to be necessitated when the great instincts of self-preservation, reproduction and gregariousness, which relate respectively to the life of the individual, of the species and of the community, come into conflict with one another. The constant demand for adrenalin when sympathetic action is increased in fear and anxiety may lead to exhaustion of the gland. Addison's disease presents a clear-cut picture of adrenal deficiency in its symptoms of muscular weakness, low blood pressure, pigmentation and vomiting. Although this is due to organic changes, slighter degrees of a similar condition are now recognized and it has been suggested that this enters into many war neuroses and other functional states characterized by vasomotor instability, low blood pressure and myasthenia. Conversely, prolonged oversecretion by the adrenals must tend to raise blood pressure through the sympathetic, tending in turn to arteriosclerosis, with all its widespread effects. The well-known influence of anxiety in producing this condition can thus be explained.

There is a close association between the thyroid, the reproductive organs and the sympathetic. The thyroid tends to enlarge at puberty, marriage and in pregnancy, while myxoedema is most apt to occur after the climacteric. Amenorrhoea is common even in the minor degrees of hyperthyroidism. The effect of sympathetic irritation in producing thyroid enlargement and Graves' disease is now recognized. Cushing showed that if in cats he sutured the phrenic nerve to the cervical sympathetic so that every respiration stimulated the latter, he could produce the symptoms of Graves' disease. The influence of distressing emotions in producing hyperthyroidism was well shown during the air-raids on London during the World War. Epidemics of Graves' disease also followed the Kishinev massacres and the San Francisco earthquake. Again, a distressing emotion has a matrimonial origin, it is particularly likely to induce Graves' disease, for here each limb of the basic tripod is involved. The disease has been compared with a state of continuous fear, a description which tallies with its general appearance.

The pituitary body also shows the two-fold association with the reproductive organs and the sympathetic nervous system. The anterior glandular part has an effect on temperature, the growth of bone and skeletal tissues and the reproductive organs. The intermediate lobe influences carbohydrate metabolism, while the secretion of the posterior lobe is mainly a stimulant to plain muscle and to the secretion of milk. The effect of the secretion of the posterior lobe on diuresis is still a matter of controversy, but it is clear that disease of the posterior lobe is often found in diabetes insipidus and that stimulation of the sympathetic nerves to the gland will cause polyuria. Probably hysterical polyuria is thus produced.

It is also clear that some cases of glycosuria are of sympathetic nervous origin; the physiological mechanism by which this can be brought about has already been explained. Diabetes is characterized, like sympathetic stimulation, by an exaggerated katabolism. This shows its effect first on the most abundant and most easily metabolised of the food-stuffs, the carbohydrates, which are also essential for muscular action, to which sympathetic stimulation should normally be a preliminary. Sympathetic stimulation induced by various disagreeable emotions will increase metabolism generally and specially lower carbohydrate tolerance. The influence of excitement and emotion in causing glycosuria is well recognized. It is commonest in Jews, a notoriously emotional race. When stocks go down in New York, says Crile, diabetes goes up. Temporary glycosuria occurred in a number of men who merely watched a football cup-tie without participating in it. Glycosuria has been, unfortunately, comparatively common in young officers entrusted with heavy responsibilities during the war. Singer and Clark have

recorded two cases in which there was alternation between glycosuria and the exhibition of mental symptoms, as if the emotional discharge asserted itself either at the metabolic or the psychic level but not at both.

Finally, the inhibitory effect of the sympathetic on the digestive processes must be remembered. Fear checks the secretion of saliva, anger stops the secretion of gastric juice. Depressing emotions acting through the sympathetic check the peristalsis of the stomach while closing the pyloric sphincter, thus leading to a dilatation of the stomach. A similar inhibition of intestinal peristalsis may occur, leading to intestinal stasis. This in its turn will lead to a drag on the sympathetic nerves in the mesentery, increasing their inhibitory effect. Thus a vicious circle is established and the persistent intestinal toxæmia that results may produce organic changes in many structures, including the group of endocrine glands which coöperate with the sympathetic.

The consideration of diseases produced through the agency of the parasympathetic lies outside the present topic, except in so far as the vagus may overact from a loss of balance produced by diminished sympathetic action. Suffice it to say that laryngeal spasm, asthma, slow or irregular action of the heart, low blood pressure, hyperchlorhydria, spastic constipation and a liability to skin disturbances of the vasodilator type are among the symptoms evoked. Since febrile reaction to disease is a function of the sympathetic, which is antagonistic to the parasympathetic, we find that those subjects with an overacting vagus do not react well to infections and, indeed, show an abnormal sensitiveness to many foreign proteins. Their tendency to undue anabolism is sometimes indicated by their tendency to flabbiness of the tissues and overgrowth of lymphoid structures. A curious point is the occurrence of sweating, since the secretion of the sweat glands is under the control of the sympathetic. But a similar discrepancy is seen in the action of a vagotropic drug such as pilocarpin.

In assessing the effects of the sympathetic nervous system in disease, it must be borne in mind that we have very little knowledge of its morbid anatomy, though a beginning has been made in the study of pellagra. The evidence so far mainly relates to function and were our knowledge of its structural alterations at all comparable to what we know of organic changes in the spinal cord, we should be on firmer ground. But enough has been learned to show that the sympathetic plays a large part in the regulation of the internal viscera, and, through the endocrine glands, in general metabolism. The balance between these glands determines to a large extent both the racial and individual characteristics. Climatic influence has a profound effect through the skin on the sympathetic nerves and hence on the endocrine glands. The development of protective pigment is an important method by which the sympathetic-endocrine system can react to this, and the unsuitability of albinos in this respect is well known. Thus physical environment can influence both temperament and structure, and the sympathetic-endocrine system must have played a large part in developing the variability of man into different races.

Evolved in a subconscious plane the sympathetic nervous system remains for ever beyond the control of the will. Timme quotes an instance which, while apparently contradicting this, proved on further inquiry to support it. This was the case of a man who could voluntarily dilate his pupils, who could cause the pilomotor muscles to raise the hairs on his arm, and who could at will produce the phenomenon of "goose-flesh" in various parts of his body. When closely questioned he admitted that the effects were produced not immediately by his will, but always by the intermediation of some association called into being by him. Thus when dilating his pupils he always imagined himself looking far into space, under which conditions the pupil does dilate. For the goose-flesh effect he would picture to himself his arm plunged into ice-cold water, and the goose-flesh appeared. Various associations produce autonomic effects without our will, and it is reasonable to infer that, if we can recall these associations through our will, the same autonomic effects will be produced.

The higher centres of the brain show their influence on the lower chiefly in the direction of inhibition. The highest organism is the most self-controlled, but the sympathetic cannot be thus controlled. The will can only help in so far as "it can make our voluntary activities harmonize with our environment." The emotional apparatus remains, as McDougall has pointed out, the most unchanging part of our nervous equipment, though the stimuli to which it responds may vary enormously in different individuals. But once the response occurs, it is extraordinarily true to type. This is comprehensible since the apparatus retains so many features of the primitive nervous system.

(W. L. B.)

**SYNDICALISM.**—"Syndicalism" is the name given to a form of socialist doctrine elaborated by, and born from the experience of, the members of the French *syndicats* or trade unions. On the one hand it is a body of social doctrine, or theory of social organization; on the other it is a plan of action for the realization of this ideal. Of all the social theories competing for existence it is the most purely proletarian in origin. One writer indeed has de-

scribed it as "working-class Socialism" (*le socialisme ouvrier*) in contradistinction to the types of socialism originated and propagated by middle-class "intellectuals." Without unduly stressing the importance of this fact, it may be said that syndicalism is that form of socialist theory which regards the trade-union organizations, entirely proletarian in origin and direction, as at once the foundations of the new society and the instruments by which it is to be erected.

The syndicalist starts from the assumptions common to most schools of socialist thought. He affirms the inherent injustice of the wages system and the fundamental immorality of capitalist society, which is based, in his belief, on the exploitation of labour. He accepts and pushes to its logical conclusion the Marxian dogma of the class war; he therefore affirms that solidarity of interests does not, and cannot, exist as between employer and employed, between capitalist and wage-earner. From these premises he draws the usual socialist conclusion, namely, that individual ownership of the instruments of production must be abolished and communal ownership and control substituted for it. But at this point syndicalism and socialism (as usually understood) part company. Whereas the orthodox socialist demands control by the consumers acting through the State and its dependent organs the municipalities, the syndicalist demand, until very recently, was for producers' control, acting through the organizations of their own creation—the trade unions. This is the essential feature of syndicalist theory, that which differentiates it from other revolutionary schools of thought. The arguments usually employed by its advocates may be briefly set out.

State organization and control of industry are, in their view, incompatible with true working-class emancipation. The State is, and must be, an instrument of class domination; it is indeed "the executive committee of the capitalist class." It exists to defend the interests of that class, and is consequently as much the enemy of labour as capital itself. To extend its powers would be to twine the bonds of wage slavery ever more firmly about the workers' limbs. The State is, however, hopelessly wedded to an uncreative bureaucracy, incapable of initiative and ignorant of industrial technique. Its control, even if it were benevolent (which the syndicalist denies it could be), would necessarily be despotic and inefficient; the spirit of routine would combine with inexperience to crush out the possibility of economic progress. Here, as will be seen, the syndicalist endorses the ordinary individualistic criticism of State socialism. Producers' control, exercised through the *syndicats*, would, on the other hand, combine freedom with efficiency. Every worker would participate directly in the government of his industry; he would thus enjoy the substance of democracy instead of the shadow offered him by the *bourgeois* State. Moreover, the worker would be led to identify his personal interests with the successful conduct of the industry; he would have a pride in his work which would manifest itself in improved quality and greater output, thus producers' control would be justified both on human and economic grounds.

The form of social organization in which this ideal could be realized was, until recently, conceived somewhat as follows. The unit of organization would be the local *syndicat*. This would be brought into touch with the local groups by means of the *Bourse du Travail*, the present function of which is to act at once as an employment agency and a general centre for trade-union activities. When all the producers were thus linked together by the *bourse*, the administration of the latter would be able to estimate the economic capacities and necessities of the region, could coördinate production, and, being in touch through other *bourses* with the industrial system as a whole, could arrange for the necessary transfer of materials and commodities, inwards and outwards. A species of "economic federation" would thus replace the structure of capitalist industry, with which would necessarily disappear the political and administrative machinery of the State. Two features of this Utopia need to be emphasized: consumers as such were excluded from any share in industrial control, and a localized system of industry was envisaged.

This latter feature was a direct reflexion of French economic circumstances; both industry and trade-unionism were much

more local in range than in other and more highly developed countries. But the movement towards large-scale organization which has so profoundly affected every aspect of economic life in recent years has produced a corresponding modification in syndicalist ideals. At the same time, it has begun to be recognized by the theorists of the movement that the consumers' point of view cannot wholly be disregarded. The experience of the World War has also had its effect. The Congress of Lyons, therefore, in 1919 was moving with the times when in demanding the "industrialized nationalization of the great services of modern economy: land and water transport, mines, water-power, and credit organizations," it defined "nationalization" as "the confiding of national property to the interested parties, namely, the associated producers and consumers." This clearly envisages organization on a national scale and the participation of consumers' organizations in control.

Syndicalist theory starts, as has been said, from the idea of a class war which must be waged relentlessly till a complete social transformation has been accomplished. The essential weapon in this struggle is the power of the organized workers. As the cause of the conflict is economic it must necessarily be fought out in the economic sphere. Syndicalist congresses have persistently repudiated political action, and pinned their faith to a general strike as the grand instrument of social revolution. This reliance upon industrial or "direct" methods of action flows necessarily from the fundamental notions of syndicalism as to the nature of the State, and also from strictly practical considerations. Outside the mine or factory, workmen hold divergent religious or political opinions which make effective mass action difficult, if not impossible. Inside, the nature of their employment gives them a sense of solidarity which overrides minor differences and bands them together in the *syndicat* for common defence; to persuade them to pass from the defensive to the offensive is the syndicalist's task, and in the accomplishment of this political labels and controversies would be a hindrance. Moreover, the political party is not, and cannot be, a class organization. The Socialist parties swarm with men of middle-class origin whose only bond with the workers is the slender one of opinion. In any event, the political party is an inefficient instrument for revolution; it can only operate effectively at electoral periods, and even then the mass of voters do nothing more than cast a ballot and return to their customary apathy for a term of years. Political action does nothing to rouse them from that apathy, to inspire them with revolutionary *élan*, to train them to initiative and independent thought. On the contrary, it asks for nothing better than docile followers of self-constituted leaders. The strike, therefore, is the characteristic syndicalist weapon. However limited in its scope and object, it is an educative experience; successful, it inspires the workers with a sense of power; unsuccessful, it impresses upon them the servility of their lot and the necessity for better organization and wider aims. Thus every strike is a preparation for the revolutionary "day," when the workers, or a fighting minority of them (for syndicalism repudiates as *bourgeois* the dogma of the sacredness of majority rule), shall seize the instruments of production by an "expropriatory" strike. In the meantime, they are working out from day to day, in the ordinary course of their employment, the ethics and the jurisprudence of the new social order.

The strike, of course, is not the only weapon in the syndicalist armoury. Various other means of waging the class war, known collectively as *sabotage*, are both preached and practised. These range from bad or slow work to the *grève perlée* (destruction of goods or machinery) and the *chasse aux renards* (assaults on "blacklegs" or *jaunes*). It is fair to say that many syndicalist leaders criticize these methods as destructive of the worker's moral and technical competence.

Syndicalism is essentially French in origin and reflects French working-class experience and conditions of life; nevertheless the history of Great Britain shows interesting foreshadowings of it. The idea of industrial self-government by the producers attracted for a time the mobile mind of Robert Owen; and the Grand National Consolidated Trades Union of 1834 was an attempt

to realize it in practice. James Morrison, a young self-taught operative builder, seems to have originated the syndicalist conception of class antagonism on the part of the working-classes (see Max Beer, *History of British Socialism*). The Building Trades Union had developed the same notion in the previous year (S. and B. Webb, *History of Trade Unionism*). The plan of a general strike—originated by one Benbow—for a time, under the strange title of the "Sacred Month," made part of Chartist propaganda. There is no evidence, however, that these projects had any echo on the European continent. The syndicalist idea, as understood in France, may be said to have originated in the discussions of the International Working Men's Association. A French delegate to the Congress of Basle in 1869, for instance, prophesied that "the grouping of different trades in the city will form the commune of the future" when "government will be replaced by federated councils of *syndicates* and by a committee of their respective delegates regulating the relations of labour—this taking the place of politics" (Levine, *Syndicalism in France*). The collapse of trade-unionism in France after the sanguinary suppression of the Communalist insurrection in 1871 had as a necessary consequence the submergence of these ideals for a considerable period, and only a combination of favouring circumstances brought them once more to light. Among these the discontent of the organized workers with Socialist politics, and the anarchist propaganda of a general strike, may be particularly mentioned. These influences manifested themselves with increasing strength during the 'nineties in the two great labour organizations of the period—the General Confederation of Labour (or "C.G.T." under its French initials) and the Federation of *Bourses du Travail*. The secretary of this latter organization, Pelloutier, did more perhaps than any other individual to work out the characteristic doctrines of syndicalism and spread them among his fellow-workers. When these two bodies joined forces in 1902, trade-unionism in general and syndicalism in particular received an immense accession of strength, and the doctrine subsequently remained—in spite of the efforts of political socialists to capture the *syndicates* for their own purposes—the characteristic expression of French revolutionary idealism.

As such, it has inevitably received much attention from observers and writers drawn from other social classes. Of these the best known is Georges Sorel, but it is a complete error to suppose that he was the originator of syndicalism, or that he has had much influence on working-class opinion. The difficult form of his writings, with their frequent obscurity and lack of continuity, would alone have made this impossible. Sorel's adaptation of the Bergsonian doctrine of the "*élan vital*" to syndicalist purposes, and his theory of "social myths" (of which the general strike is one), have had considerable influence upon intellectual circles, but have affected no more than a fringe of working-class readers.

Syndicalist doctrine has had considerable influence outside France. In the United States, a movement of somewhat similar character arose with the organization of the Industrial Workers of the World. The Chicago Convention of the I.W.W. in 1905 drew up a declaration, the preamble of which affirmed the reality of the class struggle, embodied the theory of social organization which this involves and further made a plan for the realization of this ideal:—

"The unit of organization industrially is the workshop or Yard Committee, wherein the workers are organized as workers, irrespective of craft, grade, or sex. These Committees are coordinated by the formation of Works or Plant Committees, composed of delegates from each Workshop or Yard Committee. The Plant or Works Committees are coordinated by delegates from each of these Committees, in a village, town, city, or district, forming a Workers' Council, in which there are also delegates from the residential committees, these latter being the units of the social aspects of the organization."

The above scheme differs very little from the general theory of syndicalism in France, and presents a simple parallel to the shop-stewards' movement in Great Britain, which indeed was based upon it. The influence of the I.W.W., it may be noted, was largely confined to the alien immigrant workers: it never penetrated the American Federation of Labor to any serious degree.

The influence of these ideas on the trade-union movement in Great Britain and Ireland has been very pronounced, though they have taken a different direction, modified by the traditional, conservative instinct of the British working-class. In Great Britain the real cause of the permeation of certain unions by syndicalist ideas was the absorption of trade-union leaders in administration or in politics, which caused them to lose touch with the rank and file. Especially is this the case with regard to the miners, the railwaymen's unions and the engineers.

Daniel De Leon was a leader of the Socialist Labour party in the United States from 1880 onwards, and his writings influenced British socialist thought, particularly in the Clyde and in the mining valleys of S. Wales. Though not a syndicalist in the strict sense, he advocated organization by industry and the general strike. It is significant that 1903 saw in England the secession of the Socialist Labour party from the Social Democratic Federation. After that date, in addition to the growing educational influence of the Independent Labour party (though this was never syndicalist), was seen the promotion of the Workers' Socialist Federation, the British Socialist party (in the post-war period) and the Communist League, all of which advocated practically the same structure of organization and policy. They all agreed in a lack of faith in political action, though not always refusing to utilize it, but their real *politik* was industrial action. After the Russian Revolution of 1917, they secured greater prominence; they became the stormy petrels of the labour world in Great Britain, and their effect on the political action of the Labour party was seen in the Council of Action in Aug. 1920.

In England, between 1900 and 1910, there was a growing dissatisfaction among the rank and file with political action, despite the fact that the influence of the Labour party in the House of Commons secured the trade-union movement freedom of industrial and political action by the Trades Disputes Act of 1906 and the Trade Union Act of 1913 to a greater degree than ever before, it was felt by the far-sighted among the rank and file that a speeding up was necessary, and State collectivism as a way out towards industrial democracy was discredited. James Connolly, the Irish Labour leader who was executed after the Easter rising in Ireland in 1916, started a similar organization to that of Daniel De Leon on the Clyde in 1905. In his pamphlet *Socialism made Easy* he enunciated the syndicalist principles "that they who rule industrially will rule politically," and that "the functions of Industrial Unionism is to build up an industrial republic inside the shell of the political state, in order that when the industrial republic is fully organized it may crack the shell of the political state and step into its place in the scheme of the universe." Tom Mann, while in France and Australia, which had imported the ideas of the I.W.W. from America, was also powerfully influenced by the same theories, while on the Rand, in S. Africa, a small but very influential group of leaders was working out the structure, forms and policy of a movement similar in character. In 1910 Tom Mann preached the new faith in all the big industrial centres and rapidly won many followers. Workmen had refused to follow their orthodox leaders from about 1908, as they felt that the trade union of the old Liberal-Labour school was behind the times. The Plebs League was founded by a group of labour students in Ruskin College, Oxford, about the same time, and in 1909 these seceded from Ruskin College and founded first a labour college in Oxford and then moved to London as the Central Labour College, financed by the S. Wales miners and the railwaymen. This educational movement organized classes in every mining area in S. Wales, led by tutors from these two colleges, and influenced largely by the new ideas. A similar movement took place on the Clyde, in the great ship-building centres like Barrow, Birkenhead, and Pembroke Dock, and also in inland engineering centres like Coventry and Sheffield. Then followed the railway strike of 1911 and the great coal strike of 1912. It is quite clear that the National Union of Railwaymen and the Miners' Federation of Great Britain became organized as two of the most powerful unions in consequence of the new thought, *not* because their leaders had adopted syndicalism in the form taught by De Leon and the French group of

thinkers, but because they adapted it in the peculiar British way, they made it practical and definite; they shaped it in alliance with the political and trade-union structure of Britain. They disagreed with the syndicalist view of the State, but they recognized the driving power of the theories that stated "that political power is a reflex of industrial power." The transport workers soon had a similar federation, and after the strikes of 1911 and 1912, and the Irish transport workers' strike of 1913, the Triple Alliance (of railwaymen, transport workers, and miners) was formed in 1915. The failure of this last to function during the miners' strike in the spring of 1921 discredited "direct action," and the British labour movement swung back towards constitutional and parliamentary methods.

**SYNGE, JOHN MILLINGTON** (1871-1909), Irish dramatic author, came of an Anglo-Irish family, which had contributed several bishops to the Irish church. He was born near Dublin April 16 1871. A delicate child, he was left much to himself, and as a youthful member of the Dublin Naturalists' Field Club took long rambles over the Dublin and Wicklow hills. At Trinity College, where he graduated in 1892, he obtained prizes in Irish and Hebrew, and he knew something of several modern languages. At this period his chief interest was in music and he gained a scholarship in counterpoint and harmony in the Royal Irish Academy of Music. A sonnet, moreover, contributed to *Kol-tabos*, shows not a little of the accomplishment of verse, as well as his innate passion for primitive things. During the next few years (1893-8), Synge travelled in Germany, Austria, Italy, finally making Paris his headquarters. He managed to spend a third of the year in Paris, a third in the W. of Ireland, and a third in London or Dublin. W. B. Yeats found him in Paris (1898) preoccupied with theories of language and literature, and advised him to return to Ireland. He went to the Aran Is., where he shared the life of the islanders, and he gave an account of it in a series of sketches afterwards collected in the volume, *The Aran Islands* (1907). In these and other sketches of the same period he had not quite shaken off the obsession of "stylism," and still had a wish "to do for the W. of Ireland what Pierre Loti had done for the Bretons." Gradually, however, Ireland got hold of him, and, turning to the dramatization of incidents in the life he now knew intimately, he began to elaborate, partly from his note-books and partly from the writings of Lady Gregory and Dr. Douglas Hyde, that richly imaginative though largely artificial dialect of Anglo-Irish which he carried to its furthest capacities. The Abbey theatre was opened towards the close of 1904, with Synge as one of the directors. He had already produced two one-act plays, *In the Shadow of the Glen* and *Riders to the Sea* (1903), of which the first had acquired some notoriety for the author as an affront to Irish morals; he had also written a farcical play, *The Tinker's Wedding*, which proved a failure when acted (1909) after his death. The beautiful three-act play, *The Well of the Saints*, produced before a few dozen people in the early months of the Abbey (1905), was regarded as a new affront; and in Jan. 1907, rumour having got about of its subject matter, the performance of *The Playboy of the Western World* was interrupted by an organized disturbance which continued night after night for a week. This affair, when the merits of the play came to be known, made the fame of the Abbey theatre. Synge's health was now shattered, and with

death in prospect he worked at his fine play *Deirdre of the Sorrows*, all but completing it before the end came on March 24 1909. Just before he had collected his curious *Poems* (1909).

Synge appeared at a peculiar moment in the development of Irish literature, which had begun to address a largely increased public, blended of the two main elements of the population. By descent and culture he was of the Anglo-Irish stock, and he really saw the Irish subject matter in the detached spirit of an artist. It was probably something like this that part of his audience detected in the *Playboy*, and it caused his work for a while to be rejected in his own country. Time, however, has already proved the depth of Synge's insight into the soul of peasant Ireland. The *Playboy* is by general consent his masterpiece. In this play, the fantastically rich imagery of his dialogue, which elsewhere has often a somewhat monotonous effect, has full dramatic justification; the play has even, like *Hamlet*, the supreme mark of vitality, that it conveys the suggestion of a permanent human enigma. There are good critics, however, who assign the highest place among his works to *Deirdre*.

A collected edition of Synge's works, in four volumes, was published in 1910. In *John Millington Synge and the Irish Theatre* (1913), M. Maurice Bourgeois has given, in great detail, an account of his life and writings; and there is a critical study of him by P. P. Howe (1912). (W. K. M.)

**SYRIA** (see 26.305).—The greater part of the decade 1911–21 was a period of depression and distress in Syria, which, in common with the rest of the Ottoman Empire of which it then formed part, suffered from the interruption of commerce and the wartime exactions consequent upon the Italo-Turkish, the Balkan and the World Wars in an almost unbroken succession from 1911 until 1918. Although only for a brief time an actual theatre of hostilities, Syria, which had escaped with a slight bombardment of Beirut in Feb. 1912 during which a Turkish gun-boat was sunk in the harbour by an Italian squadron, was particularly exposed to military requisitions and exactions.

Even before the entry of Turkey into the World War involved the Levant ports in a fresh blockade (Nov. 1914) the coastal population had begun to migrate inland from fear of enemy landings, and the whole country was disorganized by the pressure of refugees on the one hand and of the military preparations for an invasion of Egypt on the other, while the civil population was much excited by the shameless propaganda conducted by German agents who sought to inflame Moslem prejudice against Christians all over the country. The Minister of Marine, Ahmad Jemal Pasha, who was also in command of the IV. Army and governor-general, conducted the government of the province in such a way as to give rise during a long period to the suspicion that he aimed at imitating Mehmet Ali in founding for himself a semi-independent vicerealty; and his autocratic exactions and high-handed measures did much to pave the way for the final revolt against Turkish authority, which caused its collapse when the battles in Palestine in Sept. 1918 had broken the front.

In the subsequent operations Syria was overrun rather than conquered. Damascus fell to the British and Arabs on Oct. 1, Tyre was taken by the British on Oct. 4, Beirut was seized by a French squadron on Oct. 5 and occupied on Oct. 7 by British troops, which took Homs on Oct. 16, Tripoli (Tarabulus) on Oct. 18, Hama on Oct. 21, while the Arabs took Aleppo on Oct. 25 and the French occupied Alexandretta on Nov. 20.

Immediately after the liberation of Syria Gen. Allenby set up an administration of Occupied Enemy Territory in accordance with "the Laws and Usages of War" laid down by international agreements embodied in the Hague Convention. In order to comply as far as possible with the divergent policies to which the British Government had committed itself he confided those areas which had been liberated chiefly by Arab troops to "O.E.T.A. East," with Arab administrators under a chief administrator at Damascus—Ali Riza Pasha or Rikabi, while the Lebanon, the littoral N. of the Ladder of Tyre, and as far as Bab Yunis N. of Alexandretta, was under Col. P. de Pîpape as chief administrator. O.E.T.A. North in Beirut with French officers. Later, when Cilicia was occupied in conformity with the Armistice

which came into effect on Nov. 1 O.E.T.A. in Beirut became O.E.T.A. West and Cilicia was controlled by a new O.E.T.A. North under the French Col. Brémond.

From the very first the French had considerable difficulties to face, as Arab Nationalism and the idea of Syrian independence based upon the doctrine of self-determination both greatly influenced the civil population, which was, moreover, puzzled in that French officers were engaged in administering the country on French lines and conducting a French propaganda, when it was notorious that British troops had liberated the country and were still occupying a great part of it, and that the Arab administration in Damascus was anxious to lean on the British alliance and to ignore as far as possible the existence of the Sykes-Picot Agreement which had divided the country into arbitrarily defined spheres of influence regardless of the claims of the Arabs. Colonel de Pîpape was, moreover, much hampered by the limited selection of French officers from whom he had to pick his administrators. Furthermore, Syria being a comparatively rich and civilized part of the Ottoman Empire and inhabited almost entirely by non-Turks had been particularly exposed to the exactions of the Turkish army and Government, and her population had been greatly exhausted by military conscription, political deportations, voluntary flight of refugees and by the ravages of locusts, starvation and disease. Yet Syria was unable to benefit to any great degree from the presence of the British army, as had Palestine; few military roads were made—except the remarkable rock-cut carriage-way across the face of the Ladder of Tyre (Ras en Naqura) which was made by Sir Valentine Fane's 7th Indian Div.—little local labour was employed, and charitable contributions for the help of the civil population of Syria were the less readily forthcoming as it had none of the religious and sentimental glamour attaching to the Holy Land.

With the withdrawal of the British Army of Occupation from O.E.T.A. North and West which began on Nov. 4 1919 and ended on Jan. 19 1920 the difficulties of the French were greatly enhanced, as their own troops were hardly numerous enough to cope with the forces of disorder which began to raise their heads almost immediately. Attempts to enforce French authority were met with armed resistance. Certain of their agents played them false, and both in Cilicia and Syria Gen. Gouraud, who had become High Commissioner in Beirut in Oct. 1919, had to cope at once with Turkish Nationalist plots directed from Angora, panislamic agitation, anti-Armenian traditional hatred and Syrian and Arab Nationalism. Active troubles soon began, the Damascus administration, now controlled by the Emir Faisal, had little real authority over the semi-independent tribes which were plentifully supplied with rifles, either issued to them for war against the Turks, or captured weapons, and it was itself harassed by the conflicting policies of the Syrian extremists who resented the presence of the Arab "Patriarchalists" from the desert, and of the Hejaz Arabs who maintained that Syria was but a province conquered by them in war and lawfully at their disposal. The Emir had, moreover, to keep the peace with his French and British allies in the face of a growing anti-European spirit which was hostile to the French schemes for controlling Syria and indignant at the British attitude towards the Jews, while Syrian Nationalists resented the partition of the country between two foreign Powers and inclined towards anybody—even the once hated Turks—who offered hopes of driving the Europeans into the sea.

Baalbek was the scene of the first fighting between the French and Arabs—at Christmas 1919. In Jan. 1920 the French were attacked near Quncitera and in the Merj Iyun. Later in the month their troops were engaged in the Latakia (Ladigiye) district, and while they were able to recover Baalbek before the end of Jan. their garrison at Alexandretta was attacked in Feb. On March 1 the Jewish colony at Tell Hai, near Metulla, in what was then the French sector of Upper Galilee, was raided by Arabs.

On March 8 the Syrian National Congress, sitting in Damascus, under the influence of impatient extremists, proclaimed the Emir Faisal as King of Syria, and placed him in an extremely difficult diplomatic position. In the face of the extremists he

was unable to hold back, and he organized a Syrian Cabinet under Riza Pasha and did his best to enforce discipline throughout his dominions where compulsory military service had been reintroduced on Dec. 21 1919. The authority of Damascus was, however, unable to restrain the outbreak of Arab Nationalist enthusiasm which the formation of the kingdom of Syria aroused. Antioch was taken from its small French garrison on March 20, there was anti-European trouble from the Amanus to Jerusalem (see PALESTINE), and Arab officers entered into renewed relations with the Nationalist Turks of Angora. As early as Dec. 11 1919 Ramadhan ibn Shalash, the Arab governor of Raqqa, instigated by Angora, had made common cause with a Kurdish freebooter, Ibrahim Pasha Milli; and had attacked Deir ez Zor, from which, although in the French sphere of influence, the British had not yet withdrawn. The Emir Faisal immediately dismissed Ramadhan, but he became contumacious, declined any longer to recognize the authority of Damascus and openly adhered to the Nationalist Turks. His Arab successor in Raqqa, Maulud Pasha, was equally disloyal, and throughout the summer disturbances in both French and British areas were actively fomented by him and other disobedient adherents of the Damascus Government.

More vigorous steps were taken by the Nationalist Turks of Angora. Not content with conducting a campaign of extermination against the Armenians in Cilicia where the French were not strong enough militarily to occupy the whole province in the face of the formidable Turkish forces operating against them and the Armenians, the Government of Angora invaded northern Syria itself. Aintab was attacked in strength on April 1 1920. It was relieved by a French column with some difficulty on April 15-16, but, when the relieving troops were withdrawn on April 28, the siege was resumed on April 30. It was relieved a second time on May 22, and an armistice was concluded on May 29 by which the French evacuated the citadel and established themselves in a fresh position. They were again attacked by the Turks and relieved for a third time on Aug. 11. This time the French were strong enough to attack in their turn, although unable entirely to invest the Turks, who had occupied the citadel as part of their position. After long-drawn operations, during which the Turkish mines in one of the piers of the great bridge of the Bagdad railway over the Euphrates at Jerablus were exploded by lightning and two spans of the bridge wrecked, the French were successful, and Aintab was once more made safe on Feb. 10 1921. During this period its pop. is supposed to have decreased by some two-thirds to 25,000. Nor were the disturbances in the N. confined to the Aintab area, apart from the campaign in Cilicia. Nationalist Turks and Syrians at the beginning of Dec. raided as far S. as Jebel on the coast 14 m. S. of Latakia, and farther E. a force of Nationalist Turks established themselves near the newly fixed boundary between Syria and Mesopotamia and tried to stir up unrest among the desert tribes.

In the S. the existence of an independent state at Damascus with Nationalist aspirations to absorb all Syria and the Lebanon, and unwilling to admit French influence or recognize any French mandate, was likely to prove an uneasy neighbour—the more so as the Emir Faisal had declined on two occasions (March 27 and May 8) to repair to Paris at the invitation of the Allies to explain the situation. The Emir maintained that it was only by remaining at Damascus that he could hope to restrain the more extreme Nationalists from launching a wholesale attack upon French territory. As soon, therefore, as Gen. Gouraud had an adequate force at his command with which to enforce the authority given to France as Mandatory for Syria on behalf of the League of Nations, he made ready to impose it upon Damascus, when in June 1920 the Emir Faisal was beset by difficulties. Himself one of the Ashraf, a son of the King of the Hejaz, he found it increasingly difficult to restrain the Nationalist Syrians, the pro-Turk panislamists and the Patriarchalist tribesmen who were traditionally hostile to any authority which sought to stand between them and their prey in the cultivated lands. In June the Cabinet of Riza Pasha fell, largely on the question of the relations between Syria and the Europeans—particularly the French, and Hashim Bey Attassi took office. At that time

in the discussions of the budget in the French Chamber it appeared that France, while proposing to allot some £3,700,000 for the expenses of the High Commissionership of Syria and some £440,000 for propaganda to be directed against the extremist doctrines of those opposed to her rule, was ready to grant a subvention of £800,000 to the Emir Faisal provided that he co-operated whole-heartedly in the execution of the Mandate. The Emir was, however, in no position to do so, owing to the intractability of the Nationalist leaders who threatened to depose or murder him if he ventured to abate in any way from the extreme of their ambitions, wholly incompatible with any foreign Mandate. At the same time the economic situation of Syria was bad, and the taxes were extremely high—for example, the camel tax in Syria was £E3 (£3 rs. 6d.) per beast as against 1 rupee (rs. 4d.) per beast in Mesopotamia, and the sheep tax was 36 P.T. (7s.) against 8 annas (8d.)—and were, moreover, farmed, owing to the absence of the necessary fiscal machinery for ensuring official collection. Thus the Emir's Government was regarded with suspicion by the Nationalists and those who were opposed to any accommodation with France, or indeed any European Power.

On July 14 1920 Gen. Gouraud informed the Emir that French authority was to be enforced and that he would assume control of the Syrian railways—hitherto run by the Arab administration, parts of which had not been working since January. This intimation was none too soon, as it was known that the Arab general, Rushdi Bey, in command of the 3rd Arab Div. and governor of Aleppo, who had formerly been in the Ottoman service, was in active communication with the Nationalist Turks of Angora for the purpose of arranging joint operations against the French. Almost at the same time Gen. Gouraud found it necessary to arrest nine members of the Administrative Council of the Lebanon, apparently for conspiring with Syrian Nationalists to make it impossible for France to exercise her Mandate.

The Emir Faisal was willing to comply with Gen. Gouraud's wishes, but the Syrian Nationalists, miscalculating their strength, opposed the advance of Gen. Goybet's column which was sent to occupy Damascus. They even attacked the Emir Faisal, delayed the final message of submission sent by the Emir and his Cabinet to Gen. Goybet, and by ill-judged hostilities compelled the French to defeat them smartly at Khan Meiselin on the road through the mountains N.W. of Damascus on July 24, and to enter that city next day as conquerors rather than as protecting allies, thus bringing about the downfall of the Emir, whom the French held responsible for the resistance of the Nationalists although it had been offered in defiance of his authority and policy. The Emir's last Cabinet fell with him, and the French, who inflicted a fine of £500,000 (10,000,000 frs.) upon the country, caused a new administration to be formed under 'Ala ed Din er Rubi, while the Emir Faisal and his family withdrew from Damascus on July 28, going to Haifa, where he remained until Aug. 4, when he left for Europe.

The suppression of the Nationalists at Damascus did not immediately bring peace to the country, as the French were unable adequately to control the Hauran, and on Aug. 20 Bedouin raiders stopped a train at Khirbet el Ghazali on the Hejaz railway and murdered the Syrian prime minister 'Ala ed Din er Rubi, Ata el Ayyubi, the Minister of the Interior, and 'Abdurrahman Yusuf, President of the Council of State; for some time afterwards railway communication was hazardous in that area, and trains were generally protected by a guard of soldiers in armoured trucks at either end.

On Sept. 1 1920 Beirut became an autonomous district of the Greater Lebanon (*Grand Liban*), which was enlarged from its former extent under the Turks so as to embrace all Biqa' or the Coelestria composed of the Turkish kazas of Hasbeya Rasheya, Biqa' and Baalbek (which, originally allotted to "O.E.T.A. West," were left to the administration of O.E.T.A. East by Gen. Allenby as having been largely liberated by Arab troops), and the coast territories between Palestine and the Nahr 'Akkar; and next day the former Turkish sanjak of Latakia and the northern parts of that of Tripoli were formed into a new administrative area of Alawiya (*Territoire des Alaouites*). In the N. the Turkish

sanjaks of Alexandretta, Deir ez Zor and Aleppo, were united (Sept. 1 1920) to form the "Government of Aleppo," which thus extended to the Khabur, beyond which the country was under the administration of the French officer commanding in the *Confins Militaires*; and by the end of the year the caravan route over the Beilan Pass above Alexandretta was so far cleared of Turkish raiders and Arab marauders that civilian traffic began to be resumed. In the S. however the Hauran was still disturbed, and in March 1921 a party of Arab raiders blew up bridges on the Hejaz railway over the Yarmuk and to the N. of Dera, while the Syrian Nationalists were reported to be active in that sector of the British sphere beyond the Jordan which still formed part of the Emir Faisal's dominions but was not in any way subject to British authority. In April however this danger was abated, as the Emir's elder brother, the Emir 'Abdalla, arrived in 'Amman and restored order throughout the area of the ancient kingdom of Kerak in coöperation with the British.

*Frontiers.*—On Dec. 23 1920 the frontiers towards Mesopotamia and Palestine were fixed in such a way as to retain the whole of the Litani-Leontes watershed with Quneitara in French mandated territory, and providing for the joint Anglo-French use of the railway between Semakh and Nasib, although the line itself remains in French territory. On the side of Arabia the frontier runs from Nasib to Imtar and thence in a straight line to Abu Kemal on the Euphrates.

In March 1921 Gen. Gouraud, when in London for the Near Eastern Conference, took advantage of the presence of the representative of the Nationalist Turkish administration at Angora, Bekir Sami Bey, to conclude an agreement, in virtue of which the French withdrew from the whole of Cilicia, and adopted as the northern frontier of their Syrian mandated territory a line running from Payas on the coast N. of Alexandretta to Choban Beg (Bey) on the Bagdad railway, and thence along the railway to Nisibin, whence it runs to the Tigris and down that river as far as the frontier of Mesopotamia near Jeziret ibn 'Omar, thus restoring Killiz, Aintab and Urfa (Edessa) with an area of 22,500 sq. km. and an estimated pop. of some 640,000, to the Turks.

On March 4 1921 the formation of an autonomous Druse (Druz) State, comprising the Jebel ed Druz in the Hauran, to be under French supervision but independent of Damascus, was announced.

*Area and Population.*—Thus the area comprised in Syria as defined by the boundary agreements of Dec. 1920 and March 1921 is divided into the Greater Lebanon (*Grand Liban*), Damascus, Jebel ed Druz, Alawiya, Aleppo and the military territory.

Although no exact census has been taken in Syria the following figures are supplied by the French administration:—

I Greater Lebanon ( <i>Grand Liban</i> ):			
Sanjak	Capital	Area sq. km.	Pop.
(a) South Lebanon	Sidon (Saïda)	2,172	132,000
(b) Biqa'	Zahle	3,600	110,000
(c) Mount Lebanon	Ba'abda	3,000	180,000
(d) North Lebanon	Shtora	2,065	164,000
(e) City of Tripoli			
(f) City of Beirut		18	140,000
Total		10,855	726,000

- II. Alawiya (*Territoire des Alaouites*):  
 (a) Sanjak of Latakia—composed of the kazas of Jebele, Sahyun, Baniyas (Valenia), Omranie or Masyaf and the municipal area of Latakia.  
 (b) Sanjak of Tartus—composed of the kazas of Tartus (Tortosa) Safita, Qal 'at el Husn.  
 Total area 6,200 sq. km. with a pop. of perhaps 400,000.

III. Government of Aleppo:			
Sanjak of Alexandretta:		Area sq. km.	Pop.
(a)	Sanjak of Alexandretta, area 5,000 sq. km. divided into the kazas of Alexandretta pop. 26,000, Beilan pop. 20,200, Antioch pop. 126,900, and Harim pop. 36,700, or 209,800 inhabitants for the sanjak.		144,006
(b)	Sanjak of Deir ez Zor, area 30,000 sq. km. and a pop. of 174,000.		
(c)	Sanjak of Aleppo:		
	City of Aleppo		
	Kaza of Jebel Sima'an	4,694	25,130
	El Bab	2,437	27,752
	'Azaz	2,200	9,957
	Membij	3,867	5,030
	Ma'aret en Nu'man	3,450	21,629
	Idlib	1,800	53,598
	Raqqa	7,200	9,865
	Jisr esh Shughr	1,125	36,018
		26,773	332,985

Total for the whole Government 61,773 716,785

IV. Government of Damascus:			
(a)	Sanjak of Damascus:	Area sq. km.	Pop.
	Kaza of Damascus	600	238,504
	Wadi el 'Ajam	800	16,732
	Duma	841	37,937
	Zabdni	180	14,155
	Quneitara	2,000	43,183
	Jerude	12,000	29,431
	Nebk		22,221
		16,421	402,163
(b)	Sanjak of Hauran:		
	Kaza of Hauran	3,500	29,760
	'Ezra	1,318	30,018
	Musmiye	3,972	14,718
	Bosra Shams	970	26,436
		9,760	100,932
(c)	Sanjak of Homs:		
	Kaza of Homs	4,000	88,214
	Qaryatein	4,000	6,945
	Job Jerra	2,000	4,159
	Palmyra ( <i>Tadmur</i> )	10,000	5,340
		20,000	104,658
(d)	Sanjak of Hama:		
	Kaza of Hama	1,900	77,205
	Selmiye	2,500	20,864
	Hamra	815	—
		5,215	98,069
Total for whole Government		51,396	705,822
Thus the whole of Syria contains:—			
	Greater Lebanon	10,855	726,000
	Alawiya	6,200	400,000
	Aleppo	61,773	716,785
	Damascus	51,396	705,822
	Jebel ed Druz		
	Military Territories	25,700	154,500
		155,924	2,703,107

The precise boundaries of the state of the Jebel ed Druz had not yet been settled in 1921, but it was to be detached from the sanjak of the Hauran then in the Government of Damascus.

*Administrative Divisions.*—Of these various administrative areas the Greater Lebanon is under a French Governor who appoints Lebanese officials to take charge of the seven departments of Interior, with *Gendarmerie* and Police; Finance; Justice and Pious Foundations; Public Works, Posts and Telegraphs; Education and Fine Arts; Agriculture, Trade and Industry; and Public Health. Each of these officials is assisted by a French adviser. The sanjaks are administered by Lebanese *mutesarrifs* with French advisers, assisted by local administrative commission. Pending a census of the population and a subsequent election a provisional administrative commission of 15 Lebanese members had been nominated. Its functions and powers are analogous to those of the old Administrative Council under the Organic statute of the Lebanon in 1864.

In Damascus the administration is directed by a Council of State composed of Ministers each assisted by a French adviser.

In Aleppo there is an Arab Governor who appoints native officials to take charge of the departments of Finance; Justice and Pious Foundations; Public Works, Posts and Telegraphs; Economic Services; and *Gendarmerie* and Militia. The Governor is assisted by a council and an administrative commission. The former is composed of the heads of the five departments, of heads of religious communities, of two members from each of the three sanjaks, and of the mayors of Aleppo, Antioch and Alexandretta. The administration is supervised by a French Resident appointed by the High Commissioner, and French advisers assist the heads of departments and the *mutesarrifs* of sanjaks.

In Alawiya a French Administrator with French heads of the four departments of Finance; Public Works, Posts and Telegraphs; Public Health; and Justice and Pious Foundations, controls the administration. There is an administrative commission composed of seven Alawiya (or Nusairie), two Christians, two Sunni Moslems and one Isma 'iliye ("Assassin"). Each sanjak has a French Deputy Administrator with a native *mutesarrif* as his subordinate.

In virtue of the treaty of March 4 1921 between Gen. Gouraud and the religious and political chiefs of the Druses the State of the Jebel ed Druz in the Hauran is administered by a Druse governor elected by the population for four years, subject to the confirmation of the French High Commissioner. He is assisted by a council, elected for three years, which has one session every year during which the budget is voted, and by a permanent Administrative Commission. French advisers assist the higher Druse officials. The local *gendarmierie* and police are recruited by voluntary enlistment.

All these administrations, which are autonomous *inter se*, are subject to the general control of the French High Commissioner of Syria who

resides at Beirut, going into summer quarters at Aley in the Lebanon.  
*Currency.*—On May 1 1920 the standard currency of the pound Syrian (£S) was introduced to supersede the pound Egyptian (£E), which had been the official currency under the British occupation, and the now obsolete pound Turkish (£T). The £S is equivalent to the French *livret* of 20 frs., formerly well known in Syria, and is divided into 100 piastres of 20 French centimes each.

*Railways.*—During the decade 1910-20 the railway construction in Syria was chiefly directed towards improving and linking up the lines serving the trade routes across, and little attention was paid to the development of a purely Syrian system for the development of the country. The only line which can be classed in this category is that between Tripoli and Homs, which was opened in June 1911, and even this was chiefly useful for importing the heavier material required for the construction of the Bagdad railway which was being built across the country in the north. During the World War it was taken up and its rails used in the extension of the Bagdad railway towards Nisibin, but after the French administration had been established the line was relaid and the railway was again opened for traffic in July 1921. In the same way the French Hauran railway between Damascus and Mezerib was taken up and used in Palestine.

Of the Bagdad railway, destined to link the Syrian system with Haidar Pasha, and perhaps with Europe and Mesopotamia, the Adana Osmanie (92 km.) and Dorak-Venije (23 km.) sectors in Cilicia were opened on April 27 1911, the sector Bulgurlu-Ulu Kyshla (38 km.) in the Taurus was opened on July 7 1911, and that from Ulu Kyshla to Kara Punar (52 km.) in Dec. 1912. At the same time the Aleppo-Moslemiyeh (Muslimie) (15 km.), Moslemiyeh-Raju (77 km.), and Moslemiyeh-Jerablus (103 km.) fork was opened, and the branch from Toprak Kale (on the Osmanie branch) to Alexandretta (60 km.) at the foot of the Beilan Pass was opened in Nov. 1913. This branch was cut in several places by H. M. S. "Doris" in Dec. 1914, but was reopened for traffic in 1921. During the war every effort was made to complete the great tunnels in the sectors Kara Punar-Dorak and Osmanie-Raju, and, after being used for narrow gauge traffic for some months they were opened for standard gauge use just before the Armistice, and the first through train from Haidar Pasha reached Aleppo in Oct. 1918. Further E. the line was pushed forward to Nisibin:—Jerablus-Tell el Abyadh (95 km.), Tell el Abyadh-Ras el 'Ain (87 km.), Ras el 'Ain-Nisibin (120 km.).

In Dec. 1913 in return for a French loan the Porte gave a concession for the extension of the French standard gauge railway then working between Aleppo and Rayak down through the Biqua' and Galilee to Ludd in Palestine, but nothing came of it, and no steps were taken to start the harbour works at Jaffa, Haifa, Tripoli and Alexandretta for which permission was granted at the same time.

During the war the railways of Syria were greatly strained to meet military requirements, damaged by hostile action, and inadequately kept up, rolling stock became worn out and many engines built for coal consumption were forced to use wood. As a result when the French took over the control of the Syrian railways in July 1920 they found them in need of wholesale reconstruction.

*Agriculture.*—The chief Syrian industry is agriculture, and it is estimated by the French authorities that of 11,000,000 ac. available for cultivation in Aleppo, W. of the Euphrates, only about 1,500,000 were in 1921 under the plough. A still larger and even less developed area is known to be available for agriculture E. of the river. In the sanjaks of Hama and Homs and in the Biqua' the cultivable area is estimated at over 1,000,000 ac., while the Damascus oasis contains 1,500,000 ac. of good land.

The corn lands of the Hauran are reported to have produced 230,000 tons of wheat in 1919-20, of which 115,000 was exported to neighbouring districts. During the war the Haurani cultivators were generally able to sell their wheat to the Turks for gold, and it is estimated that they obtained £2,000,000 in this way. Payments for animals and labour however were only in depreciated paper.

The tobacco district of Latakia in Alawiya used to produce some 1,000 tons of tobacco annually.

The production of silk in Syria, which fell during the war to less than one-tenth of its former volume, began to revive in 1920, and the export from Beirut nearly doubled on the 118 tons of silk and 82 tons of cocoons and allied materials exported in 1919.

Before the war it was estimated that there were some 5,000,000 sheep, 1,000,000 goats, 500,000 kine and 250,000 camels in Syria, but during the war it appears that the sheep and goats were reduced by at least 50%, the kine suffered more severely, and the camels, which were very wastefully used by the Turks for military purposes, were still further reduced in numbers, at least 40,000 having been lost in the Jordan valley alone in 1916-7.

*Commerce.*—The trade of the port of Beirut since 1910, the last complete year of peace, may be summarized as follows:—

Exports of Syrian produce from Beirut in 1911, the last normal year of peace, and in 1919, the first complete year since the Armistice, were as follows:—

	1911	1919
	Tons	Tons
Wool . . . . .	5,500	1,521
Hides . . . . .	400	122
Olive Oil . . . . .	233	90
Apricots . . . . .	4,468	1,436
Wine . . . . .	16*	7
Gums . . . . .	40	34

During the first quarter of 1920 466 tons of wool were exported from Beirut and 248 tons from Alexandretta, which had just been reopened for commercial traffic. In that period 67 tons of hides were exported from Beirut. For 1919 the value of imports was declared at the Customs as follows:—

	£E
Jan. . . . .	59,597
Feb. . . . .	223,111
March . . . . .	629,614
April . . . . .	376,117
May . . . . .	551,737
June . . . . .	900,370
July . . . . .	1,213,974
Aug. . . . .	534,332
Sept. . . . .	848,570
Oct. . . . .	781,366
Nov. . . . .	1,031,477
Dec. . . . .	895,248
	£E8,045,513

It must, however, be remembered that goods have to be declared at their local value, on which an 11% *ad-valorem* duty is collected. During 1909 prices for imported goods were unreasonably high.

*Archæology.*—Before the war extensive excavations had been started on the site of the ancient Carchemish, near Jerablus, under the direction of D. G. Hogarth, with the aid of T. E. Lawrence and C. L. Woolley. These operations, which had yielded highly satisfactory results after the interruption due to the war, during which these three archaeologists all distinguished themselves by their widely different services against the Turks, were resumed in Jan. 1920 under Mr. Woolley, and pursued in spite of the prevalent unrest and the actual hostilities which went on in the immediate neighbourhood.

(H. P.-G.)

**SZÉLL, KOLOMAN** (1845-1915), Hungarian statesman, was born on June 8 1845. He studied at Pest and Vienna, and in 1867 became deputy for the district of St. Gotthard. He very quickly won the reputation of being remarkably well informed on economic and financial questions. Széll was one of Deák's intimates, whose ward, the daughter of the Hungarian poet Vörösmarty, he had married. In 1875 he was Finance Minister in the Cabinet of Koloman Tisza, and as such imposed on himself the task of restoring the shattered credit of Hungary. In 1878 he concluded with Austria the first economic *Ausgleich*. At that time the single Austrian bank was changed, in conformity with this arrangement, into the dualistic Austro-Hungarian bank, and Széll consolidated the Hungarian Rentes, and nearly succeeded in balancing the State finances. As he feared that this balance would again be upset by the occupation of Bosnia and Herzegovina, he resigned from the Cabinet, incurring thereby the displeasure of the Crown. He still kept his seat in Parliament, and as deputy constantly criticized the financial policy of the Tisza Cabinet. At the beginning of the eighties Széll founded the Hungarian Mortgage Credit Bank, of which he was governor until the end of his life. He opened entirely new sources of credit for Hungarian agriculture. He declined repeated offers of the portfolio of Finance. When the Banffy Ministry suffered a serious crisis at the end of 1898 and was compelled to resign in Feb. 1899, Széll was entrusted with the formation of a new Cabinet. By means of the Pact of Feb. 23 1899 he restored parliamentary peace. On the basis of the so-called Széll formula the new *Ausgleich* with Austria until the year 1907 was concluded after long negotiations. The most important result of this was that Hungary attained the status of an independent customs area, but, under the arrangement for reciprocity, still maintained intact the existing conditions of the Customs Union with Austria. In 1901, under Széll's Ministry, the new elections resulted in a Liberal victory. A year later began the struggle for the reform of the national defence, and Széll introduced in 1902 the law for increasing the number of recruits, in exchange for which the Independent party wanted concessions to the principle

	Imports	Exports
	Tons	Tons
1910 . . . . .	233,297	50,934
1911 . . . . .	216,162	48,078
1912 . . . . .	145,054	53,072
1913 . . . . .	193,844	49,248
1914 . . . . .	118,917	30,588
1919 . . . . .	64,547	18,547

of nationality. The obstruction against the provision for defence lasted from the end of Jan. to April 4 1903, and resulted in the suspension of the constitution ("Ex lex" condition). Széll sought to wear down the opposition by delay. As part of the majority would not agree to this, he resigned on June 16 1903. When his successor, Count Stephen Tisza, on Nov. 18 1904 brought about a split in the Liberal party by forcing through Parliament new rules of procedure, Széll joined Count Andrássy in the secession from the party. Under the Coalition Cabinet of Wekerle, Széll was chosen president of the Constitutional party. He tried continually, but in vain, to bridge the opposition between Tisza and Andrássy. He died on Aug. 16 1915. (E. v. W.)

**SZILAGYI, DESIDER** (1840-1901), Hungarian statesman and jurist, was born at Nagyvarad (Grosswardein) on April 1 1840. He studied law at Budapest, Vienna, and in Germany, and early attracted attention by his articles on law and politics. As head of a section in the Hungarian Ministry of Justice he travelled on a commission from the Government to England to study there the conditions of the administration of justice, of which he had a knowledge then equalled by few. Brought up wholly in Liberal

ideas, Szilagyi took a conspicuous part in the codification work of the Ministry of Justice. Deputy in 1871, professor of public law and politics at Budapest University in 1874, he was in 1877 one of the leaders of the Opposition, which, however, he left in 1886. In 1887 he was returned to Parliament by Pozsony (Pressburg) as an independent member. He became Minister of Justice in 1889. From this time to 1894 he directed his efforts principally towards a radical reform of the whole administration of the courts. In 1894 he took a conspicuous part in ecclesiastical legislation, with which his name is permanently connected. Article XXXI. of the Law of Civil Marriage, and articles XXXII. and XXXIII. on the religion of the children and on State registration, were the result of his active coöperation. After the appointment of Baron Banffy, the former president of the Hungarian House of Deputies, as prime minister, Szilagyi was elected president of the House on Jan. 21 1895, which office he retained until 1899. A man of extensive knowledge, spotless character and wide vision, and a brilliant orator, he was one of the most considerable of the Hungarian statesmen of his day. He died on July 3 1901.

See *Szilagyi's Speeches* (4 vols., in Hungarian, Ed. Fayer).

(E. v. W.)

**TACNA-ARICA QUESTION.**—Among long-standing disputes between states, the question of Tacna-Arica, between Chile and Peru, still remained unresolved in 1921. Its history can be summarized as follows.

The Treaty of Ancon, which, ratified on March 28 1884, put an end to the war of 1879 between Chile and Peru, was carried out in its entirety with the single exception of Clause 3, dealing with the fate of the provinces of Tacna and Arica. In 1881, when Peru first sued for peace, Chile, with an eye to the future safety of her frontiers, demanded the cession of three Peruvian provinces: Tarapacá, Tacna and Arica. The Peruvian Government made no difficulty about the first-named, which passed definitely into Chile's possession; but they refused to consider the cession of the relatively valueless provinces of Tacna and Arica, on the ground that public opinion in Peru would never suffer it. To smooth the way for them Chile offered to purchase the territory in question for the sum, or equivalent, of ten million Peruvian *soles*, but the offer was rejected. The war therefore continued until 1882, when Chile succeeded in occupying the Peruvian capital. Chile again made the cession of Tacna and Arica *a sine qua non* for the signing of the peace treaty. The Peruvian Government's chief concern was to find a way of acceding without grievously wounding the national sentiment. Examples were not lacking in recent European diplomacy of a means of effecting this; France, especially, had had recourse to an expedient wherewith to save appearances and mask important transfers of territory, namely, Nice and Savoy in 1860 (Treaty of Turin), and the island of St. Barthélemy in 1877 (Treaty of Paris). That expedient consisted in inserting in the treaties whereby the territory was ceded a soothing stipulation for a plebiscite, which should decide, at some future date, its definite ownership. Comparison shows that the negotiators of the Treaty of Ancon, in drafting the clause concerning Tacna and Arica, followed closely enough the formulas provided by the Treaties of Turin and Paris. The clause runs as follows:—

Art. 3. "The territory of the provinces of Tacna and Arica, bounded . . . etc., shall continue in the possession of Chile and subject to Chilean legislation and Chilean authorities for the term of ten years, reckoned from the ratification of the present Treaty of Peace. This term having expired a plebiscite shall decide by popular vote whether the territory of the said provinces is to remain definitely under the domain and sovereignty of Chile or continue to form part of Peru's territory. The country in whose favour the provinces of Tacna and Arica shall be annexed shall pay to the other ten million *pesos* in Chilean silver money or in Peruvian *soles* of equal fineness and weight.

A special protocol, which shall be considered an integral part of the present treaty, shall establish the form in which the plebiscite is to take place and the terms and periods in which the ten millions are to be paid by the country which shall remain owner of the provinces of Tacna and Arica.

Chile's contention subsequently was that this clause was inserted solely in order to allay Peruvian national resentment and so to make possible the conclusion of peace; that the plebiscite to which it refers was to be carried out under such conditions as to render inevitable the definite annexation of Tacna and Arica, upon which Chile had insisted from the first; that the sole purpose of the stipulated lapse of 10 years before the plebiscite should be held was to give the Peruvian people time to accustom themselves to Chilean rule, and that the sum of 10 million *soles* which would be paid by Chile was meant as compensation for the cession. Peru, on the other hand, maintained that the plebiscite clauses introduced into such treaties as those of Turin and Paris had not the disguised intention that Chile claimed, and that, even supposing they had, the plebiscite called for in the Treaty of Ancon was of a very different nature.

The period of 10 years had not expired before Peru took steps to secure the holding of the plebiscite, proposing conditions, which, as they included the restriction of the vote to the Peruvians born in the two provinces, proved unacceptable to Chile. Several years of fruitless negotiation ensued, and in 1901 Peru

severed diplomatic relations. Four years later she accepted Chile's invitation to renew their intercourse, and to seek with her neighbour an agreement based upon the interests and convenience of the two republics; but the Peruvian plenipotentiary, on his arrival at Santiago, made it clear that his Government desired no other agreement than such as would forward the carrying-out of the plebiscite under the same conditions proposed previously, and diplomatic relations were again broken off.

Notwithstanding her contentions as to the purely accommodatory nature of the clause in dispute, Chile always declared her willingness that the plebiscite should be held, provided the suffrage were not limited to Peruvians but extended to all the adult inhabitants of the provinces, including foreigners resident therein since a certain date, who could read and write; and that a representative of Chile, as the nation exercising sovereignty over the territory, should preside over the commission controlling the proceedings. For her part, Peru insisted that the 10 years stipulated for the holding of the plebiscite was a *maximum* period, and that since its expiry in 1894 Chile no longer exercised such sovereignty *de jure*, and could not therefore justly claim to preside. Chile, on the contrary, held that the term was intended as a *minimum* period.

Diplomatic intercourse having been resumed, Chile, in 1910, made definite proposals for the holding of the plebiscite in accordance with her contentions. Peru refused, and once more broke off relations.

In 1920 Peru made formal request for the revision of the Treaty of Ancon by the 1921 Assembly of the League of Nations, but later withdrew her demand, reserving the right to renew it at a future Assembly. The problem of Tacna and Arica stood in 1921 therefore in much the same position as at any time subsequent to the Treaty of Ancon, though towards the end of the year suggestions for arbitration were again under discussion. The area of the territory in dispute was only 23,306 sq. km., and only 18,000 ac. were in 1921 under cultivation. The pop. numbered no more than 37,000, and the trade and industry were almost negligible. Nor were any ethnical, linguistic or religious considerations involved, the inhabitants, whether Chilean or Peruvian, being of the same race, speaking the same language and professing the same faith.

**TACTICS**<sup>1</sup> (see 26.347\*).—While personal reminiscences of the Great War had up to 1921 appeared in plenty, and in many languages, it is remarkable that so far no comprehensive and scientific study of its abiding tactical lessons had been published. Diarists and biographers there had been; also not a few training-manuals and text-books; but the world was still awaiting the Clausewitz or Henderson who would show it how military science developed from 1914 to 1918 in the minds of great leaders, how the world struggle differed from anything and everything that preceded it, and how it was finally lost and won. This is the task which will eventually confront the true biographer of Marshal Foch, the greatest soldier figure of the war, when it becomes possible to follow his innermost thoughts during the progress of the conflict. The future historian will have to show how principles and theories which had been developed during a lifetime of profound study were abandoned, modified or confirmed as the result of experience of modern war, contact with the military chiefs of Allied nations and bitter contest with the best military brains Germany and Austria could produce. When some skilled military writer shall have interpreted Marshal Foch as G. F. R. Henderson interpreted Lee and Stonewall Jackson, it may be possible not only to understand the Allied victory but perhaps even to penetrate into the future and to realize some of the simpler problems which war on the great scale has in store. That is the best the military historian can hope to do—so to present the picture of the past as to throw

<sup>1</sup> This article may be considered also as supplementing, for the World War, the article STRATEGY (25.986).

\* These figures indicate the volume and page number of the previous article.

some light upon the obscurity of the future. Always we are left groping our way through what is at the best semi-darkness, but any ray of light is helpful. It is in this spirit and with full consciousness of the difficulties and dangers which lie ahead that the present writer attempts here the task of reviewing the practical developments of the decade 1910-20 and of presenting them in a form which in 1921-2 might already be out of date.

### I.—TACTICS IN THE WORLD WAR

*Tactics and Strategy.*—First it may be as well to inquire exactly what is meant by tactics, and whether the division between strategy and tactics is left as clear as it was before the World War introduced the new feature of continuous lines offering no flanks for attack, and ceaseless fighting which, from day to day and month to month, varied only in intensity.

Let us ask two questions: (a) Can grand or combined tactics still be defined as the sphere of the higher commander on the day of battle? and (b) if so, can we accept the corollary that all the fighting on the western front from 1915 until 1918 was tactical and outside the sphere of strategy? All days were battle days; but does this mean that the problems which the commanders of the British, French and Italian armies in the field were called upon to solve were essentially tactical in their nature? The definition may require some modification, but to the second question the answer is distinctly "Yes." They were vast problems involving all sorts of considerations, but they were essentially tactical. Questions of strategy, so far as Britain was concerned, were dealt with in London, or in conference with her Allies in Paris, Rome or elsewhere. It was in these places and not in the field that great decisions were formed as to the despatch of troops to the various theatres of war, the formation of new forces, and the wisdom, or the reverse, of embarking upon fresh undertakings. Behind them all were the equally anxious problems of finance and allotment of man-power. In modern wars, Army, Navy (in which is included the Merchant Marine) and Munitions are only three departments of the nation; each puts forward its rival claims, which can only be judged by the Government in consultation with the technical advisers. And so it is that, as war absorbs into itself more and more of a nation's energies and resources, the Government with the prime minister at its head must accept responsibility for *strategy* in the highest possible sense of the word. In no sense, however, can the Government be held to be responsible for *tactics*, which are the exclusive sphere of the military commanders. The Government, in consultation with their technical advisers, allot troops; soldiers alone command them. Whether that command, in its turn, gives scope for *strategy*, as in Palestine, or only for *grand tactics*, as on the western front, depends upon the number of men available in proportion to the size of the theatre of war, upon the railway and road development of the theatre of operations, and upon many other considerations.

*Strategy*, now as always, is the art of bringing the enemy to battle on terms which are disadvantageous to him; *grand tactics* are the methods employed for his destruction by a force of all arms. Before the war, when aviation was still in its infancy, the term "all arms" included as a rule no more than infantry, artillery and cavalry. Even the engineers were rarely considered as having any direct influence upon the result of a battle. All this is changed, and to the four arms there must now be added, without any doubt, aeroplanes and tanks, and it is a matter for the gravest consideration whether in future wars the chemist will not occupy as important a position as he now does in peace. Machine-guns are purposely excluded here, not because their importance is underrated, but merely in the hope of avoiding unnecessary complication and because they may be included in the wide term of infantry, which also covers such accessories as bombs and rifle grenades.

The sphere of the higher commander in battle is therefore by so much enlarged in that he must now know how to utilize and combine far more weapons than were at his disposal in earlier wars, and the demands made upon him are in the same degree heavier and more complex. And so through all the long chain

of command, from "the Chief" at G.H.Q. to the platoon commander in the foremost trench. It has been amply proved that, more than ever, no arm of the service is complete in itself; each requires in a greater or less degree the assistance of others in order to win even a small success. The smallest raid into a German trench needed hours, almost days, of careful preparation: night patrols and aeroplane photographs for reconnaissance; artillery and trench mortars to destroy the enemy's wire; if the ground won is to be held engineers must help to make it good, and even if it is not to be held the engineers must be called upon to destroy with explosives enemy machine-gun emplacements or other defences. Then, according to the object of the raid and the intentions of the commander, arrangements must be made for the withdrawal or reinforcement of the raiding party, all of which require most thorough and careful forethought. Much of the detailed preparation for a minor operation of this kind will fall upon company and platoon commanders; and when it is remembered that in war platoons may be, and often are, commanded by junior non-commissioned officers, it is seen that, just as responsibility for the success of higher strategy must depend upon the wisdom of the prime minister and the Government, so responsibility for tactical success extends to the last link in the chain of military command.

War has become national in a sense in which it never was before, and it is a sad reflection that, after twenty centuries of Christianity, its study is more important than ever. Owing to the insular position of Great Britain, its dense population and consequent dependence upon overseas trade, it, more than any other country, is dependent upon success in war. No country in the world could so ill support defeat; yet in no country is the study of war so much neglected. There has recently been a most praiseworthy effort to train the British soldier in the arts of peace; it might be well if similar efforts could be made to fit the civil population in all classes of society for the vital responsibilities of war. The response to Lord Kitchener's appeal in 1914-5 proved beyond doubt the essential soundness of the national spirit; but the story of a hundred battles proves that spirit without professional knowledge and skill is desperately expensive in life.

Hence it is that, just as our conception of war has become national and the need of study more general and less strictly professional, so our definition must be less restricted. We prefer to regard tactics, even "combined tactics," simply as the art of commanding troops in action, without any limitation as to the number of troops employed or the status of the commander. Indeed, it is perhaps easier, in considering the fighting in France and Belgium, to exclude the rôle of the commander-in-chief than that of many of his junior subordinates. Nevertheless, for the purpose of this article, we shall be concerned entirely with the sphere of the larger formations, with organization and equipment, with the effect of inventions upon attack and defence, and with the changes and developments in tactics since Russia and Japan fought themselves to a standstill in the plains and highlands of Manchuria.

*Communications.*—Now, these changes have been brought about by exactly the causes which have produced the whole evolution of tactics during the last two thousand years, namely, improvement in weapons and communications—that is, in conveying ever more men to the field of battle and in furnishing them with ever more efficient means of killing when they get there. For, after all, the object of tactics is to kill; if possible without being killed, but in any case to kill. For the first time in history these developments enabled armies during the World War to be placed and maintained in positions which offered no flanks for attack and therefore afforded no scope for strategy or for manoeuvre. Increase of population was a contributory cause, but primarily the "continuous lines" extending from sea to sea were rendered possible only by the development of railway and road communications, and by firearms of marvellous range, rapidity and precision. It was these features, existing so far only in Europe, and attaining their fullest influence only in western Europe, which differentiated the World War from everything

which preceded it. Something of the same kind was seen during the Russo-Japanese War, when great mountain ranges made movement far from the railway extremely difficult, with the result that, broadly speaking, neither Oyama nor Kuropatkin had room for manoeuvre, and tactically the war resolved itself into a series of frontal assaults on a defended defile. So it was that, from 1914 to 1918, commanders on the western European front had no opportunity for crushing strokes and striking victories like Austerlitz, Rossbach or Salamanca. Their genius had to show itself rather in the skill and ingenuity with which they made use of the resources placed at their disposal by modern science, than in rapidity of movement and dashing leadership. More than ever war has become "an art served by many sciences," but in so doing it has lost much of its romance. It was only as they moved eastward out of Europe to Palestine and Mesopotamia, where restricted railway communications and scanty populations made it necessary to operate with comparatively small forces in big countries, that the British commanders found themselves working under conditions which previous experience had made familiar to them. Before 1914 instances of the tactical use of railways could be numbered on the fingers of one hand; the arrival of the ever-famous Stonewall brigade on the battlefield of Bull Run, the dramatic appearance of Lambton's naval brigade at Ladysmith on the morning of Oct. 30 1899 at a critical moment in the action of Lombard's Kop, and one or two other examples complete the tale of occasions when railways can fairly be said to have had a direct influence upon a tactical decision.

All this is now changed. Broad-gauge and light-gauge lines are now a necessary and ever-increasing part of the mysterious machinery of battle; and it is they, together with the complementary service of road transport, that have made it possible to mobilize the entire manhood—almost the whole adult population—of a nation, and to maintain in the field armies numbering several millions of men. These armies in their turn claim the services of every industry and every factory to such an extent that in time of war the term "civilian population" is merely misleading, and undefended towns and ordinary merchant vessels become legitimate objects of attack. Thus it is that the new feature of "continuous lines" has been introduced into civilized war, and frontal attacks have become inevitable.

*Obstacles: Wire.*—Here, however, we must stop to consider another new factor which has resulted directly from the extended use of railway communications and the "nationalization" of war. This is the use of obstacles, more particularly of wire. For several years before 1914 it had been almost evident to every student of the great military problem of Europe that, so soon as the German armies were mobilized and received the order to march, every road between the Dutch frontier and the mountains of Switzerland would be filled to overflowing with advancing troops. There was, be it noted, no doubt whatever among competent soldiers that Germany would not hesitate to violate the neutrality of Belgium; indeed, the very size of her armies, as well as her declared principle of envelopment, made it certain that she would do so, even had the fortifications of the eastern frontier of France not barred the way from Alsace and Lorraine to Paris. To this extent, therefore, "continuous lines" had been foreseen, but it was generally considered that they would exist only during the opening phase.

The present writer can recall very clearly an interesting argument between a very distinguished senior officer and two of his subordinates which took place early in 1914. The senior officer maintained that he found it impossible to visualize a collision along a front of something like 140 miles. The two subordinates maintained that this gigantic battle must be the result of the numbers which would certainly be mobilized; clearly it could not last very long before it broke up into groups of armies operating semi-independently, but, taking Mukden as something of a guide, they expected to see the first, and perhaps the decisive, battle rage from Belfort to the neighbourhood of Namur for perhaps three weeks. "Well," was the senior officer's final remark, "I'll give you three weeks, but not a day longer," and

with that the juniors departed content. Some things, it will be seen, turned out as anticipated; but many, especially the rapidity of the Allied retreat, turned out very differently. On the one hand, the German movement through Belgium was too quick and too successful to allow the Allied armies to make the expected stand; on the other hand, the continuous lines were never broken, and after three months of moving warfare the *siege of Germany* began. Once started, it lasted, not for three weeks, but for four whole years—a phenomenon which was due to field fortifications and, more than anything else, to wire.

It is a remarkable fact that in all the tactical exercises, staff rides and other instructional devices in which soldiers were accustomed to indulge before the war, the problem of field fortification was but lightly considered. This is true of all countries, and it is quite wrong to believe that Germany, as has been held in too many quarters, showed any greater prescience than her enemies. The reasons are simple: first, it was not possible to test the efficacy of trenches, dug-outs, barbed-wire entanglements or "pill-boxes" under manoeuvre conditions, when time was short and compensation a grave consideration; secondly, it was generally agreed that fortified positions limited the offensive power of the defending garrison and could themselves be easily avoided or turned. This was the teaching of the South African and all previous campaigns, and even Manchuria gave but little indication of what war was to be like in the highly industrialized areas of western Europe. Thus it was that, at the end of the first battle of Ypres, in the middle of November 1914, the British, French and German armies found themselves confronted with entirely novel tactical conditions which demanded entirely new tactical treatment; and to-day new tactics involve not only the training of troops but also the application of mechanical device. In 1914 the new conditions were those of "continuous lines," for which the solution was eventually found, but only through a weary process of "trial and error," in the course of which the ultimate victors came perilously near to exhaustion.

It is not proposed here to discuss the various methods which were adopted with a view to avoiding the central problem and seeking a decision in other theatres of war, for they have nothing to do with tactics. It is, however, permissible to refer to the effect of operations in different theatres of war upon the tactical evolution in the armies of the Allies and of the Central Powers.

*Interior Lines.*—Put quite briefly, it would appear to be this—that, as a result of their central position and possession of interior lines facilitating the rapid transfer of troops from one theatre of operations to another, the German commanders were not so free to concentrate their attention upon the demands of local conditions as were the French and especially the British. The theatres of Mesopotamia, Gallipoli and later of Salonika and Palestine were so remote from France and from each other that it was less difficult to allot to each the necessary proportion of the different arms, and to give to each the distinct training and equipment essential for its efficiency, than it was for Germany, whose troops and commanders were constantly on the move from one theatre to another. Hence it was that, while Germany was inclined, or compelled, to compromise, the Allies opposed to her were able to specialize, with the result that, with one notable exception, in every theatre the initiative and the lead in tactical development were with them. That notable exception was the not very noble or praiseworthy one of the use of gas. In the true realm of tactics it may fairly be said that, from the end of 1914 until March 1918, when Ludendorff had for the first time been able to devote his individual attention to the problems of the western front, the lead in tactical evolution was always with the Entente armies.

*Changes in Organization.*—To return to the deadlock in the West, it became clear towards the end of 1914 and beginning of 1915 that the problem of field fortification could not be solved by the methods of 1870, S. Africa or Manchuria. It was not that principles were changed and theories at fault. The power of modern rifle fire had been amply demonstrated, especially by the British Expeditionary Force, whose trust in their weapons had been more than justified; the French seventy-

five, the British long-range field gun (for as such the 60-pounder must be regarded), and indeed the German heavy howitzers had done all that had been expected of them, but one and all failed to compete successfully with the new factor. Infantry, even with the best available artillery support, could not be expected to assault with success the hostile lines, which were daily becoming stronger; and cavalry, which had been invaluable during the retreat of Aug. and the early days of Sept. 1914, as well as in the subsequent advance, could find no scope when Nov. and Dec. came. No vulnerable flank was offered, nor was there the slightest opportunity for those daring raids against the hostile communications which have sometimes offered such dangerous attraction to the cavalry leader. The conditions were indeed the exact opposite of those in S. Africa during 1899-1902. Similarly, the German army had been able to prove that the theory of tactical envelopment was the inevitable corollary of machine-guns and quick-firing artillery, for frontal attack was far too costly, and Joffre and French and their lieutenants had once more proved to the world that counter-attack was the soul of successful defence. It was not that the principles or theories were wrong; so far as they went they were correct enough, but the trouble was that they did not carry sufficiently far. Their basis was manœuvre, and suddenly it was found that manœuvre was no longer possible, but that it had been displaced by the tedious processes of siege warfare. Infantry was still the conquering arm, but was now less dependent upon cavalry and even more dependent upon engineers and artillery; while the Air Force was rapidly acquiring an importance which, though foreseen, had in peace always been put aside by considerations of expense. It was at this stage, too, that the bomb first made its reappearance as an infantry weapon, and its use increased to such an extent that, towards the end of the battle of the Somme, in the autumn of 1916, it threatened to supersede the rifle. Many new auxiliary services grew up, many new weapons were invented, and leading men in every branch of science devoted their great talents to the destructive art of war.

Yet amidst so much which was new the great central problem of war remained unchanged, for it was, as it always has been, the destruction of the enemy's field army. In the new conditions which had arisen this meant great innovations in army organization. The cry was for more technical troops of all kinds. A third field company (engineers) and a pioneer battalion were added to each British division; the signal service was greatly extended, and, above all, the demand for more and heavier artillery was urgent. Every month, almost every week, new needs were discovered and fresh demands from the armies in the field were reaching the British authorities at home, who were already more than fully employed in equipping Territorial divisions and in raising new armies. Put quite broadly, however, the problem of the capture of the German fortified lines, which could not be turned, was one of improved material and improved coöperation between artillery and infantry, each with the attendant services necessary to efficiency. That is the main thesis to which it will be necessary to return again and again.

*Artillery and Infantry Coöperation.*—At this point it will be as well to look backward and to trace very briefly the history of the evolution of artillery and infantry coöperation for the previous twenty years or so. It is the story of the contest between artillery and field fortification, which in some respects resembles that between the gun and armour at sea, or between ships and forts. It is, in fact, the old contest between attack and defence. For many years before the S. African War it was an accepted axiom of combined tactics that any attack by infantry must be preceded by an artillery bombardment, of which the principal purpose was partly to overcome the enemy's artillery and partly to shake the *moral* of his infantry. Accustomed as we have become during the last few years to think of guns at least in hundreds, it seems strange to turn to the official account of the battle of Magersfontein (1899) and to read that at 4.30 P.M., on the day preceding the attack which was to take place at dawn, the British force opened fire with one 4.7 gun, one battery of howitzers and three of field artillery, which "shelled Magers-

fontein Hill for two hours. . . . Though his guns had provoked no reply from the Boer, Lord Methuen felt confident that they had not only inflicted loss, but had produced considerable moral effect upon the Boer commander. This, however, was not the case. The fire had but one important result, that of warning the enemy that an attack was imminent." The fact was that in those days military science overestimated the powers of a few guns and underestimated those of hastily constructed entrenchments, which were then in their infancy and almost an unconsidered feature of war. Again and again the same thing occurred, but so difficult is it to learn from any experience but one's own that we find the Japanese army making exactly the same mistake some four years later. Then, at the action of Ta-shih-chiao, the Japanese, with a vastly stronger artillery than the British had possessed at Magersfontein, bombarded the Russian right for several hours. So heavy was the fire on this occasion that General Stakelberg declined to occupy his trenches, and reported to his senior officer that, should he be forced to do so in order to repel an infantry attack, he would certainly suffer very heavy loss. But no infantry attack developed, Stakelberg's troops remained under cover, and the losses inflicted by the bombardment were almost negligible. From these and many similar experiences the theory was deduced that, in order to get results from the fire of the guns, the artillery bombardment must be accompanied by an infantry attack. To coöperate successfully, the action of the two arms must be simultaneous instead of successive, for only in this way could the enemy be compelled to man his defences, to show himself above his parapets, and to expose himself to shrapnel fire. In the words of the French regulations of 1913: "Artillery no longer *prepares* the infantry attack, but *supports* it." The old term, "artillery preparation," belonged to a dead language.

Such, in a few words, was the generally accepted theory of infantry and artillery coöperation at the beginning of the World War, and during the earlier stages it proved to be remarkably correct. It was not until the field armies found themselves brought up short by deep trenches protected by wire entanglements, furnished with strong revetment, and strengthened by dug-outs, that the experts discovered that, curiously enough, new conditions must be met by old methods, and the discarded, not to say discredited, "artillery preparation" was revived.

Up to this point, too, it may be fairly claimed that the actual artillery material with which the various armies took the field in the autumn of 1914 had stood the test well, although naturally subjected to the restrictions on ground of expense which are inevitable in times of peace. Each artillery, English, French and German, had, however, developed on somewhat different lines, corresponding to the mentality of the different nations, their theories of battle fighting and the amount of money available for each experiment. Each of the three armies had a mobile field gun, England the 18-pounder, France her famous 75-millimetre and Germany the 77. France, thinking always of rapid movement either in retreat or advance, and always refusing to consider the possibility of standing on the defensive, had concentrated on the light, rapid-firing and very accurate field gun, with an organization on a divisional basis. England also believed in the divisional organization, but in addition to the 18-pdr. she had the 4.5-in. howitzer for high-angle fire, which had been found so necessary in S. Africa, and the 60-pdr., whose long range, commanding the roads and often forcing premature deployment of the German infantry, was invaluable during the retreat. The German army alone possessed heavy howitzers and high explosive, no doubt because the general staff always considered the possibility of being forced to engage permanent fortifications on the French and Belgian frontiers, but it was weak exactly in those points upon which the French and English had specialized. The 77-mm. was inferior as a field gun both to the 75-mm. and to the 18-pdr.; it possessed nothing corresponding to the 4.5-in. howitzer; and its heavy artillery, while possessing great shell power, was lacking in range. Thus it came about that, when expense was no longer a ruling factor, each army began to borrow ideas from the other and to adopt material

suitable to the wearisome ordeal of trench warfare. Thus, too, Europe stumbled into that war of material, of ever stronger material of defence and ever stronger material of attack, which was to last until the autumn of 1918. It was under these conditions that the German army, which was to have been back in its own homes "by the fall of the leaf," found itself pinned to French and Belgian soil, and that the war, which at the outset, as was believed by most of the leading authorities in England, political, military and financial, could not last more than six months, dragged out its devastating existence for more than four long years. One man among them alone ventured at that early stage to lay his plans for a long war, Lord Kitchener.
